The first room at the Royal Academy contains two striking pictures by Mr. Calderon, called "The Olive" (6), and "The Vine" (25). Both are studies of Italian girls, and in both the drawing and colour strike us as admirable. Between them hangs a picture by Mr. P. R. Morris, called "Sons of the Brave; the Orphan Boys of Soldiers, Royal Military Asylum, Chelsea" (20), which pleases us much less than most of Mr. Morris's work. The subject is eminently popular. Near this is a picture by Mr. Peter Graham, "A Highland Drove" (26), dealing with his accustomed style of subject and painted in his best manner, and beyond it a strangely false and unpleasing picture by Mr. Yeames, entitled "The Finishing Touch; Green-room at Private Theatricals" (39). Mr. Frank Dicksee's portrait picture of Sir W. E. and the Hon. Lady Welby Gregory (40) has much invention and skill; and Mr. Keeley Halswelle's "Flood on the Thames" (74) is admirable in its swing and movement. Mr. Ouless has a fine portrait in this room (10). The second gallery possesses an extraordinarily beautiful work by the President, "A Sister's Kiss" (142), two fine pictures by Mr. Alma-Tadema, "Spring Festival" (176), and "Not at Home" (195), both, as might be expected, classical; a portrait picture by Mr. Pettie (122), in which both the composition and colouring seem to us open to fault-finding; and, amongst other things, a fine and stately picture by Mr. McWhirter, called "The Lord of the Glen" (177), the title referring to the single tree which stands out against a stormy sky. Mr. Storey has a charmingly quaint picture in his best manner called "Follow My Leader" (155). The third room has one strong attraction in what the Catalogue quoted by Mr. Mark Twain would call the "self-portraits" of Mr. Watts and Mr. Millais, "Painted by invitation for the Collection of Portraits of Artists painted by themselves in the Uffizii Gallery at Florence." Both works are such as one would wish to see representing English art, and preserving in an enduring shape the memory of two great English artists in such a gallery. Mr. Millais has also in this room a fine portrait of Mr. Bright (322), a charming portrait of Miss Stepney (239), and a picture called "Cuckoo" (315), the consideration of which we defer. Mr. Long has a fine and pathetic figure of "An Assyrian Captive" (210); and next to it hangs an evening landscape of much feeling and beauty, called "Solitude," by Mr. Barrett Browning. Mr. Poynter's large picture, "A Visit to Æsculapius" (250), which has been bought by the Academy under the terms of the Chantry Bequest, strikes us as more careful and correct than pleasing. Another picture close by—"Returning to the Fold," by Mr. Davis (255)—has been purchased under the same conditions. Why this, which has some obvious faults, should have been selected rather than Mr. Davis's really beautiful cattle picture in the first gallery, "Family Affection" (65), we are unable to understand. Mr. Orchardson's picture of Bonaparte "On Board H.M.S. *Bellerophon*, July 3rd, 1815, off Cape Ushant" (262), is a fine and striking work. Napoleon's figure has an air of being strangely tall, and the costume is not, we believe, strictly correct with regard to the date given; but these are small blemishes which do not interfere with the impressiveness of the whole picture, in which the dignity and lifelikeness of the figures are not less remarkable than the sense of distance and sea atmosphere which the painter conveys. One of Mr. Vicat Cole's best works, "The Leaves of

Wasted Autumn" (310), is in this gallery, and so is Mr. Alma-Tadema's "Fredegonda" (328), which is, we think, his best work in the Royal Academy, and one of the best things that he has painted. The artist's well-known command of light, colour, and atmosphere is admirably exhibited, and there is true dramatic play in the figure and face of the Queen, who looks on helpless at her husband's espousal of Galeswinthe. Mr. Pettie's delicate and forcible [illegible]nt of a figure in white, entitled, "His Grace" (249), atones fully for any shortcomings in the work of his which we have already mentioned. M. Bastien-Lepage is represented by an admirably finished small portrait of the Prince of Wales (229). Mr. Frank Holl and Mr. John Collier send two excellent presentation portraits, the one of Major George Graham (302), the other of Dr. Carpenter (254). Among the most remarkable works in the fourth gallery are Mr. J. D. Watson's simple, straightforward, and touching picture of "Corporal Trim" (375); Mr. Brett's admirable sea-piece, "Britannia's Realm" (387), which has, with good reason, been purchased under the terms of the Chantery Bequest; and Mr. Long's "Henry Irving as Hamlet" (416), which, if it fails in some respects as a likeness, is very attractive as a picture.

The fifth gallery contains two important battle-pieces dealing with the same period—"Blenheim" (453), a spirited and finely executed work by Mr. Woodville, and "Marlborough after the Battle of Ramilies" by Mr. Crofts. In the same room Mr. Herkomer shows what it is not too much to call a magnificent landscape called "God's Shrine" (468). Gallery No. VI. contains, amongst other things of interest, a pleasing landscape study by Mr. Ernest Parton (578), which has a strong resemblance to his last year's picture, a very tender and pretty work by Mr. W. J. Hennessy, "Summer Days" (555), and an admirable picture by Mr. Van Haanen of "Pearl Stringers in Venice" (579). The great attraction in the following gallery will probably be—and by no means unjustly as regards its merits, though they perhaps will not be the first cause of the attraction—Mr. Prinsep's much talked-of picture of "The Imperial Assemblage held at Delhi by the Viceroy, Lord Lytton, and attended by the principal chiefs of the Indian Empire" (625). Probably no modern painter has had a more difficult task set to him, and it is hard to conceive the difficulties being more boldly and successfully overcome. Another picture of unusual merit in a quite different direction is M. Munkacsy's "The Two Families" (650). Neither the Lecture-Room nor the tenth gallery is particularly full of attraction, and for the present we must be content with calling attention in the former to Mr. Briton Rivière's admirably humorous animal picture, "The Last Spoonful" (1051), and in the latter to the strong and finely-painted picture, "The Sins of the Fathers" (1453), by Mrs. John Collier. All other and fuller account of works, which it is utterly impossible to take in within the time assigned for the purpose, we must defer to future occasions.

The Grosvenor Gallery Exhibition is, we think, unusually good. It is strong in almost every direction. Mr. Burne-Jones sends one of his finest works to it, and the effect of this is not marred by any productions from the same hand which might seem to offer a handle to the kind of ridicule which a critic last year attempted to fasten on one of the painter's exhibited works. Some of Mr. Burne-Jones's far-off followers do indeed contribute some exceedingly, if unconsciously, humorous works; but such contributions as these are very few compared with the pictures of real and striking merit which the Gallery has to show. It is to be regretted that Mr. W. B. Richmond's large picture of "The Song of Miriam" could not be finished before it was sent to the Exhibition; but, on the other hand, there is so much beauty in the intention, and, so far as it has gone, in the execution, of the work, that one must be glad that it was sent at all. Mr. Watts sends several works, one of which, "Daphne" (43), is perhaps as grandly beautiful as anything which Mr. Watts has painted. To M. Bastien-Lepage's work we have already referred. Further remarks upon this and upon many things worthy of attention and admiration we must reserve for the future. The sins of the Royal Academy are visited upon the Grosvenor Gallery in this way, that a person who has spent the greater part of one day in filling his memory as much as he can with the 1,658 works shown at the Academy, is inclined on the next to give himself up to rest and thankfulness in the Grosvenor Gallery, and wisely to abandon any attempt at detailed faultfinding or praise.

THE THEATRES.

THE series of morning representations which Mr. Hollingshead announced with amusing irony as "Palmy Day Performances" was begun last week at the Gaiety with the fine old crusted piece of *George Barnwell*. The play is from many points of view interesting. Lillo, its author, has been not unjustly styled the father of English melodrama, with reference to the fact that he was the first, or nearly the first, playwright who ventured to break away from the cut-and-dried composition and versification according to rule which abounds in such works as, for instance, those of Rowe and Aaron Hill. One of his plays, *The Fatal Curiosity*, which, if we remember rightly, is included in the list of pieces which Mr. Hollingshead proposes to revive, has much force. A stronger writer than Lillo might have made of its horrible story an appalling tragedy; Lillo is to be credited with at least having turned it into a thrilling melodrama. That *George Barnwell* is not devoid of merit is perhaps sufficiently proved by the fact that its story has been burlesqued by such writers as James and Horace Smith and Thackeray.

This goes at least to show that it has "vitality enough to preserve it from putrefaction." Its author had the wit to discover the dramatic force of the old story, and though one may regret, as in the case of *The Fatal Curiosity*, that the plot was not appropriated by some better writer, yet it may be admitted that there is truth in the statement made in the "remarks" (by Cumberland's son-in-law) which are prefixed to the acting edition, that "it is altogether very ingeniously conducted, involving many just and affecting incidents, and presenting such a picture of deceit, infatuation, guilt, and remorse, in two characters of *domestic* life, that is not to be found in any other play." This, as has been above observed, was true at the time when it was written, and it would certainly be a pity if the first successful drama of domestic life were allowed to fall into oblivion. There is something not unpleasing in the many oddities of the piece, one of the strangest of which perhaps occurs in the scene which was paraphrased in the *Rejected Addresses*, in the lines—

> There's Nunky as fat as a hog,
> While I am as lean as a lizard,
> Here's at you, you stingy old dog,
> And he whipped a long knife in his gizzard.

The uncle, who has not before made his appearance, enters in "a cut wood," making these remarks:—

> If I were superstitious, I should fear some danger lurked unseen, or death were nigh! A heavy melancholy clouds my spirits; my imagination is filled with ghastly forms of dreary graves, and bodies changed by death.
>
> (*Enter George Barnwell at a distance.*)
>
> O death, thou strange mysterious power, seen every day, yet never understood, but by the incommunicative dead, what art thou? The extensive mind of man, that with a thought circles the earth's vast globe, sinks to the centre, or ascends above the stars; that worlds exotic finds, or thinks it finds, thy thick clouds attempts to pass in vain. Lost and bewildered in the horrid gloom—defeated, she returns more doubtful than before; of nothing certain, but of labour lost.
>
> (*During this speech Barnwell sometimes presents the pistol, and draws it back again; at last he drops it, at which his uncle starts, and draws his sword.*)
>
> *Barnwell.* Oh, 'tis impossible.
> *Uncle.* A man so near me, armed and masqued!
> *Barnwell.* Nay, then there's no retreat.
> (*Plucks a poniard from his bosom, and stabs him.*)

The relevance of Barnwell's last-quoted observation is not altogether apparent. The strongest scene in the play is that which follows between Millwood and her victim; and this again is oddly concluded by Millwood's remark, "They [the servants] disapprove of my conduct." In the interview between the two, however, there is real dramatic perception; and Mr. Crauford and Miss Willes, who played the parts at the Gaiety, must be congratulated on the manner in which they acquitted themselves. Praise is also due to Mr. Maclean and to Mr. Shine for their impersonations respectively of Thorowgood and the uncle. We look forward with interest to the promised performance of "Monk" Lewis's *Castle Spectre*; and we trust it may some day be followed by the representation of that exquisitely melodramatic and incomprehensible piece dramatized from an episode in *The Monk*, and called *The Bleeding Nun*. This was performed some time ago at the Haymarket, and was given, or intended to be given, with due gravity; but the parts were unfortunately distributed.

At New Sadler's Wells last week *Romeo and Juliet* was produced for six nights, with Miss Isabel Bateman and Mr. Clifford Harrison in the two principal parts. Miss Bateman as Juliet showed more power as an actress than we have discovered in her former performances. There was more room for fault-finding, perhaps, than there was in—to take one instance—her rendering of the Queen in *Charles I.*; but to say this is only to say that there is a wide gulf between the two parts. Juliet is one of the most difficult characters in the list of Shakspeare's plays. It demands at the same time youth and a science which is rarely allied with youth. To arrive at a just conception of the character is by no means easy; to carry out such a conception is exceptionally difficult. Miss Bateman's rendering of the part gave us the impression that she had grasped its meaning. That the interpretation should sometimes fall short of the intention was only to be expected. But it is much that a young actress should succeed in the execution of such a part so well as she did. In one scene especially, that known as the balcony scene, the actress's idea and rendering seemed to go hand in hand, and the result was a natural and poetical interpretation of one of the most beautiful passages in Shakspeare. Mr. Harrison's appearance in the part of Romeo had a peculiar interest in connexion with the common belief that reciting and acting are separate arts. Mr. Harrison did not appear as a novice on the stage; indeed it is not very long since we noticed his promising performance of Pierre in *The Two Orphans*. But both before and after that event he has been chiefly known as a "reciter" of unusual skill. In a certain sense of course reciting and acting are closely allied; that is, a person who can speak well, who can deliver poetry with feeling and with just emphasis and force, has at least one strong point in his favour if he takes to the stage. This Mr. Harrison had to start with. His elocution was throughout admirable. The difficulties he had to contend with were those of gesture and what may be called knowledge of the stage. He

wanted in some scenes repose, in others variety of action. These, however, are faults which can be overcome and which are naturally more accentuated in so trying a part as Romeo than they are in such a part as Pierre. Romeo was evidently so carefully and keenly thought out, and was in many instances so well expressed, that we must hope that Mr. Harrison will not continue to make his appearances on the stage merely temporary. With his general idea of the character of Romeo we have little fault to find; but we are unable to understand why in the scene where Romeo deprecates Tybalt's provocations, he chose to speak in an angry, instead of a conciliatory, tone. It should, however, be added that one of Mr. Harrison's best passages, the burst of rage after Mercutio's death, was so well given that it did not suffer from what we regard as a strange mistake in the previous scene.

Romeo and Juliet gave place this week at the same theatre to Mr. Joaquin Miller's play called *The Danites*, which is given by the same company who have for some time past been playing it in various parts of the United States. People who remember Mr. Joaquin Miller's brilliant and startling romance *Life Among the Modocs* will readily believe that he is capable of writing a play dealing with Far West life which abounds in striking situations. The odd thing is that persons who have actually mixed in this kind of life tell us that Mr. Joaquin Miller's representation of it is true and correct. But, even if this were not so, the piece would still be as attractive in itself as are the almost forgotten melodramas of Bouchardy. It is, in fact, a new development of an old and justly popular type of play—or, in other words, it is a delightfully melodramatic stage presentation of the scenes of early Californian life, of which Mr. Bret Harte has given us such attractive presentments in another form. The people who move through the play are as ruffianly, as chivalrous, as ferocious, as kindhearted, and as alive as the heroes of Dumas's best novels, and their adventures are as exciting as those of the brilliant personages who are concerned in that great writer's novels and plays. We have, in fact, the romance of a past time transplanted into the present century, with the assurance from experts that the bounds of probability have not been transgressed.

The central idea of the piece—which might with advantage have been more closely kept to—is the pursuit by two Danites, or Mormon avengers, of the last supposed survivor of a family who devoted themselves to the pious task of getting rid of Joseph Smith, the Mormon Prophet. Their proposed victim is one Nancy Williams, who, with her little brother, takes refuge, in the first act, in a miner's camp in the Sierras. In spite of the protection promised and given by the rough and chivalrous inhabitants of the camp, one of the Danites, skulking behind a rock, manages to pick off the little brother with a rifle-shot, and the curtain falls upon a group of miners summoned by the report, who believe that Nancy herself must have perished in a wild leap which she has made down the cliff after her murdered brother. The chief characters in this scene, as throughout the play, are Sandy McGee, a miner—and, according to the programme, which bears evidences of Mr. Miller's deliberately odd style, "a painter, a sculptor, a mighty moralist, a man who could not write his own name"—and Nancy Williams, "the last of a doomed family." These characters are represented by Mr. and Mrs. McKee Rankin, upon whom, and especially upon Mr. McKee Rankin, the burden of the play principally lies. The next act takes us to "The Howling Wilderness Saloon," where many of the characteristic incidents of early Californian life which have been described by Mr. Bret Harte are put, and very well put, upon the stage. The great event of the scene is the arrival of a school-teacher. "The boys," expecting a male school-teacher, "conclude to lay for him"; and the change of attitude in everybody, from Sandy and "the Parson" (so called on the *lucus a non lucendo* principle) down to "the Heathen Chinee" Washee-Washee, on seeing an attractive and self-possessed young woman step out of the stage-coach, is admirably conceived and executed. The scene is full of lively illustrations of that wild kind of life with which the whole play deals; and in its course we are made acquainted with a boy, named Billie Piper, who seems strangely unfitted for the place in which his lot is cast, and whose smooth face and gentle ways mark him at once as an object for jealousy with regard to the "Widder" or school-teacher in the eyes of the other "boys." He finds one fast friend in the vigorous and predominant Sandy, whose protection of him has a strongly dramatic purpose.

The third act, which passes outside "the Widder's" cabin, is full of incident, and during it Hulda Brown, "the Widder," discovers by a chance the secret of Billie's life, which, as the experienced playgoer may surmise, is that "Billie Piper" is really Nancy Williams in disguise. Nancy's natural terror of the Danites is reason enough for Hulda's promising to keep the secret at all costs. The two Danites believe that the school-teacher is their proposed victim, and their discomfiture when at the point, as they think, of success in their murderous scheme they are baffled by the sudden appearance of the brave and reckless "Parson," is one of the points which make the third act of the play intensely dramatic.

The piece up to this point is, of its kind, admirable, and all that is wanted to make it equally good throughout is some judicious cutting. There is plenty of dramatic stuff in the two final acts, but its effect is injured by needless complications and over-protracted dialogues. The improbability of "Billie's" secret being kept, in spite of the many reasons for revealing it, might readily be pardoned for the sake of the interest which the concealment keeps up, if there were any kind of explanation given of Sandy's really incomprehensible condonement of what seemed to him his wife's undeniable infidelity, and of "the Parson's" unhesitating belief in "Billie's" assurance that there was nothing wrong. However, much must be overlooked in a rattling melodrama; and *The Danites* is a play which combines the unalterable attractiveness of a thoroughgoing melodrama with a freshness and novelty which are peculiarly its own. The acting of the piece is for the most part remarkably good. Mr. McKee Rankin, who plays Sandy, has the fine presence which the part demands, and has also a vigour and pathos, the intense naturalness of which is no doubt the result of study and art. His self-restraint which never amounts to over-repression in passages of emotion is singularly effective. One such passage, in the fourth act, is particularly striking. His gesture and facial expression are throughout good. There is much force, and not a little pathos of the rude kind appropriate to the character, in Mr. Sheridan's representation of "the Parson." These qualities are well shown in the effective and original situation in the fourth act, when, instead of the expected Derringer, met by another held out at full cock, he presents to Sandy the key of the cabin which he wishes to make over to his former rival. Mr. Harry Hawk's "Heathen Chinee" is pleasantly humorous without exaggeration. Mr. Walrond as one of the Danites assumes a grim stealthiness which recalls some of De Quincey's descriptions. Mrs. McKee Rankin has a difficult part to play as Nancy and the false Billie Piper. She has much intelligence and intention, but wants the power of making herself heard at all times, and of refraining from paying attention only to the "points" of the part. Miss Tanner's performance of Hulda, "the Widder," could hardly be improved, and the two smaller women's characters are, like the minor male characters, well played. The piece is highly attractive and will perhaps have a still better effect if the cuts which we have suggested are made.

THE TWO THOUSAND GUINEAS.

In former days there was a good deal of gambling on the Two Thousand throughout the winter, but of late years betting on that race has not begun until the spring. Racing may possibly be an important matter, but we fancy that many people who derive some amusement from this sport during the summer months are not sorry to hear nothing about it in the depth of winter.

A couple of three-year-olds of great merit were entered for the Two Thousand of this year by one person. These were Beaudesert and Prestonpans, the nominations of the late Marquess of Anglesey. The first-named had won the Middle Park Plate, the other had won several races; but the death of Lord Anglesey rendered both of their nominations void, so that much of the interest of the Two Thousand was taken away. Beaudesert and Prestonpans being out of the race, Mask was made the first favourite. Mask is a chestnut colt by Carnival out of Meteor, and he began his racing career by winning the July Stakes at Newmarket in a canter by three lengths, although opposed by a good field, thereby winning between sixteen and seventeen hundred pounds in stakes alone. His next race was the Doncaster Champagne Stakes, for which he started a very strong favourite. Contrary to expectation, he ran nowhere, the race being won by Evasion, whom he had beaten in his previous race. His next performance was to beat The Song in a Produce Stakes at Newmarket, but he ran nowhere in the Rous Memorial Stakes at the same meeting. He ended his first season by winning three races in succession—the October Produce Stakes, the Home-bred Post Produce Stakes, and the Home-bred Foal Post Stakes—having landed more than four thousand pounds in stakes for his owner. There seemed to be every reason for making this horse the first favourite for the Two Thousand, now that Beaudesert and Prestonpans were out of the race. The two-year-olds, Bend Or and Robert the Devil, seemed to be superior on public running, but unfortunately neither of them had been entered for the Two Thousand; so, all things considered, the high position of Mask seemed to be amply justified. Mask's first appearance in public this year was at the Newmarket Craven Meeting, where he was brought out for the Column Produce Stakes. Only one horse was to oppose him, and this was Lord Falmouth's Merry-go-Round, a bay colt by Scottish Chief out of Spinaway. This horse had only been out once last year, and on that occasion he had walked over, so this was in reality to be his first race. Mask looked in very forward condition, and his hocks, which had been objected to by some critics last year, had decidedly improved. It could not be said that Merry-go-Round's joints were quite clean; but he had better hocks than Mask. Merry-go-Round was a little the higher and more lengthy of the pair, but Mask was rather stronger across the loins. Heavy odds were laid on Mask, and he was expected to win in a canter. He made the running as far as the Abingdon bottom, where Merry-go-Round seemed beaten; but on ascending the hill Mask suddenly tired, while Merry-go-Round, on the contrary, struggled very gamely, succeeded in passing Mask, and won the race by a length. A change in the betting on the Two Thousand necessarily followed this race. Merry-go-Round was also in the Two Thousand, and as he had to be made a better favourite than Mask, the question presented itself whether Merry-

go-Round, was now to be made the first favourite. The Craven Stakes, which took place the next day, threw further light on the subject. The race was won by Fernandez, Merry-go-Round being second and Brotherhood third. A length and a half separated the leading pair, and half a length the second and third. But then they were not running on even terms. Brotherhood was giving the large amount of weight of 10 lbs. to Merry-go-Round, and the latter was giving 5 lbs. to Fernandez. The conclusions drawn by the learned on the subject were that by far the best performance in the race was that of Brotherhood. The Ancaster mile, over which the race was run, is a severe course, with a hill, and yet Brotherhood gave 10 lbs. to Merry-go-Round 15 lbs. to Fernandez, and ran within half a length of one, within two lengths of the other. The betting men, therefore, made Brotherhood first favourite for the Two Thousand. Brotherhood is a rather lightly built horse, on sound, clean limbs. He is by Rosicrucian out of Hilda. Last year he won five and lost six races. In the Prince of Wales's Stakes at York he had run within half a length, at even weights, of the famous Bend Or, who had run five times without being once beaten. In most of the races in which Brotherhood had been beaten he had been carrying extra weight, and an analysis of his public running pointed him out to be a colt of decided merit. Fernandes had run twice last year, and had been beaten each time. He also was entered for the Two Thousand. He is own brother to the famous Isonomy, being by Sterling out of Isola Bella, and, like Isonomy, he seemed quite to enjoy racing up a tiring hill. It is true that he was receiving 15 lbs. from Brotherhood; but nevertheless, a length and a half is quite enough to win a race by, even if a horse has a couple of stone in hand; and it appeared to be far from clear that Fernandez must certainly be worse than either Merry-go-Round or Brotherhood. Altogether it may be noticed that the results of the Column Produce Stakes and the Craven Stakes afforded a very eligible opportunity for gambling—an opportunity, we may observe, which was by no means neglected.

There was another important element of uncertainty in the Two Thousand. This was a horse called Beauminet, a French colt by Flageolet. So highly was this horse esteemed that he was at one time actually first favourite for the race. This was in the moment of confusion which followed the Craven Stakes, before critics had had time to make up their minds upon the results of that race. Another French-bred horse, named Milan, had many supporters. Then there was Abbot, by Hermit, who had won the Houghton Stakes at Newmarket last autumn, and Zealot, another colt by Hermit, who had won the Bretby Nursery at the same meeting. Muncaster, a colt by Doncaster out of Windermere, was one of the leading favourites. He did not run last year, but he belonged to the Duke of Westminster, who also owned the celebrated Bend Or. As Bend Or was supposed to be the best public performer among the three-years-olds, it was argued that, if the trainer of these two colts considered Muncaster to have a good chance for the Two Thousand, his opinion would be worth following, as he had every opportunity of finding out whether Muncaster was nearly as good as Bend Or. Petronel had beaten Strathardle at the Houghton Meeting, in the Troy Stakes, and Strathardle had won the Prendergast Stakes from a fair field in the Second October Meeting; so, although Petronel had once been beaten, he seemed well worth backing for the Two Thousand. Clarencieux, a colt by Lord Lyon, had run third last week for the City and Suburban, but he had only had 5 st. 12 lbs. to carry, and he had finished five lengths from the second horse. Although deprived of much of its interest through Prestonpans and Beaudesert being disqualified, the Two Thousand appeared to be a particularly open race, and it became the medium of a good deal of heavy gambling.

In the presence of a large number of people, and on a fine but cold day, seventeen horses went to the post for this race. They were a few minutes late, but Mr. M'George got them off at once to an excellent start. Mariner soon came away from the line and tried to bolt, but before he had gone a quarter of a mile he was thoroughly tired of galloping, and he was soon passed by the horses who were really contesting the race. The French horse Beauminet then took the lead, and made the running past the Bushes into the Abingdon Dip. Brotherhood, the first favourite, was soon beaten, and we may here observe that he was absolutely the last horse in the race. In the Abingdon Bottom Beauminet tired, and was passed by Muncaster, Petronel, and The Abbot. Muncaster was leading, and he was running very strongly as if he had plenty of power left in him for the finish; but as he was nearing the winning-post he ran in a coltish, awkward fashion. This was his first race, and the novelty of the situation seemed to distract his attention. Still he kept going at a great pace, and although Fordham on Petronel kept drawing up to him, it appeared probable that he might yet win the race. It was an intensely interesting struggle; and when the leading pair came in, apparently locked together, with The Abbot and Beauminet at their quarters, racing was seen in its perfection. It was almost impossible for an ordinary spectator to feel certain which of two Dukes was the winner of the Two Thousand, but the judge gave his verdict that the Duke of Beaufort's Petronel had beaten the Duke of Westminster's Muncaster by a head. The Abbot was but three-quarters of a length behind Muncaster, and Beauminet was only a head behind Abbot. The former first favourite, Mask, was next. Petronel was in splendid condition, and he had run in public before; but Muncaster, although looking well, ran in what racing men term a very "green" manner. Some horses run as well on their first appearance in public as on any subsequent occasion; but others fail to show their true form the first time that they are tried in a regular race. A severe race is a very different thing from a private trial; and the very fact of being pressed and hurried must be disconcerting to a horse which is unaccustomed to it. To face a roaring crowd for the first time must be enough to make a nervous horse falter, while even the bravest may be distracted by the noise. Muncaster is a very tall horse, while Petronel is low. It is said that the former measures 16 hands 2 inches, and the latter 15 hands 2 inches under a standard. Petronel is a strongly-made black colt, with a powerful back and good quarters. Unfortunately he is not entered for either the Derby or the St. Leger. The Duke of Beaufort has raced but little of late. This is not his first victory in the Two Thousand, as he won that race thirteen years ago with Vauban, who, by the way, was half-brother to Petronel's dam. Each time that he has won the Two Thousand Fordham has ridden for him, and the race of Wednesday last was a triumph of jockeyship. We are far from saying that the victory was won entirely by fine riding; but we may safely affirm that the slightest want of judgment on Fordham's part would inevitably have lost the race. It is certain that great credit is due to both the trainer and the rider of the winner. It may be that great credit is also due to the horse himself, but we are not very well assured at present upon this point. Of one thing, however, there can be no diversity of opinion—namely, that the late race for the Two Thousand was a remarkably fine contest. If the result throws but little, if any, light on future events, it rather increases than diminishes their interest, and we have enjoyed a capital race for the Two Thousand without exposing the three-year-old form of the first favourite for the Derby.

REVIEWS.

STUART'S NILE GLEANINGS.*

(First Notice.)

IT is a question whether work which is nearly good does not disappoint one more than work which is really bad. Mr. Villiers Stuart undertakes a very interesting and very important task. The whole title-page of his book will show its scope and his intentions:—*Nile Gleanings concerning the Ethnology, History, and Art of Ancient Egypt as revealed by Egyptian Paintings and Bas-reliefs; with descriptions of Nubia and its great Rock Temples to the Second Cataract.* Such a programme worthily carried out would produce a work of the highest value. The English works of this comprehensive class on Egypt are nearly all out of date. Very few competent historical scholars have the means necessary to the prosecution of such a design as Mr. Stuart's. He has spared no expense in digging, and has sought out places seldom visited. If he had added to his other outlay the engagement of an artist to make his drawings, or, still better, of a student of the Egyptian language to interpret the inscriptions, his labour would have been more fruitful than it is. When we endeavour to winnow from these Gleanings the grains of good corn and reject the chaff, it is surprising how little remains. Mr. Stuart's ignorance leads him so often into mistakes which are absolutely absurd that we are afraid to trust his observations when he is probably correct. To take a single example—he repeatedly asserts that the kings of the early monarchy were called "Servants of God." In p. 59 he complacently observes:—"I have to thank my moderate knowledge of hieroglyphics for the interesting discovery that each of these ancient kings bore the title of Hon Nuter, Servant of God." This is in an account of the tomb of a certain functionary where Mr. Stuart found the ovals of two old kings, "Khoufou" (elsewhere called Chufu and Shoofoo) and "Ouskaf," with the words *Hon Nuter* under them. He immediately concluded that *Hon Nuter* referred to the kings. His "moderate knowledge" betrayed him into a fatal error—an error so egregious that the reader whose knowledge is very little less moderate will feel inclined to shut up the book. *Hon Nuter*, as the most elementary work on hieroglyphic inscriptions might have informed Mr. Stuart, refers not to the Pharaoh, but to the functionary in whose tomb it occurs. He was Hon Nuter, priest to the divinity of Shoofoo, and the same to Ouskaf. So far from the king being called servant of God, he is called God, and the deceased is his worshipper. This error is repeated several times; but Mr. Stuart seems to have begun to feel some doubt as to it, for he puts a note at the end of the book in which he observes that the older kings did assume divine titles. In one of the plates Mr. Stuart gives us an inscription of Seneferoo, the oldest king whose monuments have come down to us, and in it, if Mr. Stuart's "moderate knowledge" had sufficed, he would have found that the king calls himself "the golden Horus, the good god." We cannot go further back than Seneferoo.

Fortunately the whole book is not of this character. There is much in it which is marked by care, accuracy, and patient research. The illustrations are very numerous, though of unequal merit. A summarized account of Egyptian art is very useful. The table of temperature taken twice a day for the three winter months will entitle Mr. Stuart to the gratitude of a great many medical men and their patients. There is a somewhat superficial account of

* *Nile Gleanings.* By Villiers Stuart. London: John Murray. 1879.

hieroglyphs, in which, by the way, the reed which formed the first letter of the Egyptian alphabet is mistaken for a knife; and a list of pyramids, in which that of Teta wants a syllable; but these additions to the book will probably be found sufficiently complete and correct for the requirements of readers who do not want to go very deep into the subject. They have, at all events, the advantage of brevity. The chronological question—which, after all, is the great historical question in Egypt—is well stated. There is an excellent itinerary, with distances both up and down the Nile. The whole list of kings is given, from the celebrated table of Abood or Abydus; and, annexed to it, a translation—not always right—of the meaning of each king's title. At the end of the preface Mr. Stuart acknowledges his indebtedness to Dr. Birch and Brugsch Bey. It is a pity he did not submit his work to some such scholars for correction before sending into the world an ethnological theory like that found in the twenty-ninth chapter, or such a statement as that in the account of the Dosch, where he makes not one, but three horses, ride over the prostrate bodies. The plan of the work is good. We are taken over the ground as much as possible in chronological order. Mr. Stuart, therefore, begins at once with the pyramid field, and his chapter on Maydoom is the fullest account of that most interesting place that has yet appeared in English. The drawings of two of the tombs, though not remarkable for artistic skill, and very inferior in that respect to the works they represent, are valuable, the hieroglyphics being so carefully copied as to enable the reader to correct Mr. Stuart's erroneous translations.

Maydoom is, indeed, though seldom visited by travellers, in many respects the most remarkable place in Egypt. There we see for the first time writing in use. There are the oldest tombs. There the beautiful statues of Rahotep and Nefert—very inadequately sketched by Mr. Stuart—were found. Besides all this, there is the pyramid which the Arabs term "el Kedab," or the False, and which, while it is possibly the oldest in Egypt, has not yet been entered. With regard to this pyramid Mr. Stuart, though he does not describe it fully, establishes the fact, hitherto uncertain, that the great mound on which it appears to stand is in reality formed of partially disintegrated masonry; and that therefore the height of the whole mass from the ground is to be reckoned as that of the pyramid. This at once gives it rank as one of the greatest, not one of the least, as it has hitherto been supposed. The two tombs of which he gives views are those of Nefermat and his wife, the lady Atet, not *Atot*, as Mr. Stuart writes it. He makes a further mistake with regard to this lady, owing to the misleading system of transliteration he has learnt—a system, we regret to observe, followed by many of the chief English Egyptologists. "The Princess's name, Atot, is significant of the earliest times, for it was the name of the grandson of Mena." Now the successor of Mena, or Meny, the founder of the first dynasty, was Tetá, and his successor was Atoth. This last is the name evidently in Mr. Stuart's mind; but there is no connexion whatever between it and the name of Atet, and the mistake is owing to the whimsical fact that the French, not having the sound of *th* in their language, ignore in transliteration the value of the hieroglyphic sign which appears as the last letter in the name of King Atoth, and which is absolutely identical with the Greek *theta* in one of its forms. The lady's name is made with a short *A* and two *t*'s. As in Arabic and other languages, there is in the ancient Egyptian an unnamed vowel which interposes between two consonants, forming thus a syllable, pronounced, of course, like our short *e*'s in such a word as "kettle." Mr. Stuart makes too much of the scarcity of religious indications; for, though the figures of gods are absent from the monuments of the Early Monarchy, numerous priestly offices are mentioned. He gives a hieroglyph which consists of four little vases joined, and occurs on the exterior of the tomb; but in the text he puts three only, and they are upside down. He goes on to guess that one of them was for "Ammon Ra," and the others for Hathor, Isis, and Osiris. Apart from the mistake of considering Hathor and Isis as two distinct divinities, there is a second error in the sentence; for the worship of Amen—not Ammon—was introduced in the time of the Eleventh Dynasty, and these tombs probably belong to the time of the Third. As a rule, however, except when he guesses, Mr. Stuart is able to keep chronological sequence in his remarks, and does not, like many better authorities, jumble up together all periods and styles under the one term, Ancient Egyptian.

The difficulties of transliteration were never more plainly illustrated than in this book. The French spelling *ou* for our *oo*, a combination which, like *th*, the French language does not admit, and the use of *ch* for *sh*, for the same reason, show where Mr. Stuart obtained his "moderate knowledge." It has betrayed him into the error about Atet, and similar faults are thickly scattered through his pages. On the much-debated name which he gives as Ti, "or Tih, as the guide-books call him, in defiance of his hieroglyphic orthography," Mr. Stuart's remarks are misleading for precisely the same reason. One form of the Greek *theta* is derived, through the hieratic, from the final letter of the name of King Atoth, as we have seen. The other form is equally traced to the double loop of cord which is the initial of the name of Ti. The initial is followed by two vowels, both the same, and both answering to our short *a*, but still more nearly to the Hebrew and Arabic *Aleph*. Doubled, this letter must have become something exceedingly like our *y*. In any case, Mr. Stuart's suggestion of Taa is better than the French and German Ti or Tih, which does not contain a single letter of the original name. The functionary whose tomb is so regularly visited, and has been so often described, may be best called in English *Thy*. Mr. Stuart does not often write about places so well-known; but here he seems to have gone out of his way to make a mistake. He copied the oval of one king, a king about whom there is certainly some doubt, but wholly neglected the other ovals in the same tomb, which solve the difficulty over which he spends some futile guessing. He has evidently never seen M. de Rougé's masterly work on the *Six Premières Dynasties*, or he could not have stumbled either here, or over the phrase "servant of the god."

The ethnological theory which we have referred to is stated in full in the twenty-ninth chapter. Where much more learned students than Mr. Stuart have hesitated, he is certain. He believes the civilized race which we find at the dawn of history already seated in the Nile Valley to be identical with that which peopled Europe, and that both came from Asia. It is really not worth while to go fully into what Mr. Stuart is pleased to consider reasons for this belief. The most elaborately stated is that of language, the very one, as most people have come to know, of least value in such an argument. In Mr. Stuart's hands it is simply misleading, and sometimes even goes against his theory. The substantial identity of "Mamma" in languages so essentially different as Egyptian, Sanscrit, Malay, and Cornish proves nothing. Some of the examples he gives are singularly unfortunate. "Hapi," he says, is the Egyptian ape-headed god, and he compares the name with our word "ape" and the German "affe"—a comparison which would be more striking were it not, unfortunately, that Hapi was not the ape-headed god, but the wolf-headed god commemorated in the Greek name of Lycopolis, or Ssoot, the city where a wolf was worshipped. Perhaps the most amusing of these comparisons is where Mr. Stuart, observing on the Egyptian hieroglyph for 100 that it is O, naïvely remarks, "May not our sign for a hundredweight, cwt., be derived from it?" This is such an upside-down way of stating the question, and is so typical an example of Mr. Stuart's mode of argument, that it needs no comment. But it is curious that Mr. Stuart did not go on to discover the identity of several other Roman numerals, and perhaps all the Roman letters, with hieroglyphics. There are better things in the book than these, but we must reserve a notice of them for a second article.

THE RELIGIOUS DRAMA.*

OBERAMMERGAU is, we suppose, responsible for this volume; and what the author and the translator have to say concerning its famous play will suffice for the purpose of most readers, though it adds nothing to the information previously accessible on the subject, or to the criticism which has from various points of view been expended upon it. Eduard Devrient's monograph of the year 1851 still remains by far the most interesting contribution to a special "literature" which is already assuming formidable proportions. Students of the drama are not likely to forget the fact that, in its original form, the composition of the Ettal monks dated from a period very far removed from the *naïveté* of the mediæval plays; and that though the taste of a later age greatly modified this Benedictine copy of Jesuit models, from a literary point of view that which is presented at Oberammergau cannot in any sense be called a popular play. Again, while as a matter of course the effect produced by the performance is in part due to causes which even the coolest critic would forbear from too readily defining to himself, it likewise owes something to others, the very obviousness of which has caused them to be overlooked. There are few companies of actors which have received a more thorough and continuous training than that of the peasant confraternity of Oberammergau. Their rustic stage has its treasury of traditions, and they have by constant practice learnt, what to a company of performers is worth infinitely more than the possession of two or three brilliant stars, the art of *playing together*. In 1871 (for we cannot speak from personal experience of earlier performances) the absence of anything like first-rate talent in the rendering of any of the leading parts in the representation—including the chief character—would have been disappointing, had it not been more than compensated for by the artistic adequateness of the whole. To be sure, the hand of the Munich artists could be more than guessed at; and its touches are not likely to be wanting in the performances of 1880. It is, however, quite possible to surrender oneself to the emotional effects of the last Mystery which is ever likely to be presented to large concourses of people in the Christian world, without fancying that the same effects could be produced on an educated spectator of the present day by a genuine religious play of the middle ages.

In bethinking himself of his more immediate public, the translator of the lectures before us has, by the changed title which he has adopted, avowedly done an injustice to their author's original scope. Professor Hase's subject was the Religious Drama of Christian times in general, and only part of his work is devoted to an account of Miracle Plays and Sacred Dramas proper. Indeed the earlier of these lectures, which more especially correspond to the title chosen by Mr. Jackson, seem to us by no means the most valuable of the series, the scheme of which is in any case a more comprehensive one than this title implies. A fuller and more systematic treatment than would probably have accorded either with the circumstances of their delivery or with the general range of their author's studies might have given these lectures a place of real importance in critical and historical litera-

* *Miracle Plays and Sacred Dramas.* A Historical Survey. By Dr. Karl Hase. Translated from the German by A. W. Jackson, and edited by the Rev. W. W. Jackson. London: Trübner & Co. 1880.

ture. The history of the religious drama of the middle ages is full of interest in itself, but of even greater interest is the question of its relations to its successor—the modern regular drama of the West—and of the traces which the latter exhibits of the influence of its predecessor. Professor Hase has discussed this theme from various points of view in connexion with Spanish, French, and German dramatic literature; and he concludes with a brief essay on the relations between the Church and the Theatre which is neither out of place in this volume, nor (as a recent debate at Berlin has again shown) unseasonable with regard to the social life of Germany at the present day. From the history of English dramatic literature and of the English stage Professor Hase has derived fewer illustrations than might have been expected; but his omissions have been in some measure supplied by his English translator and editor, in additions to the notes, which, according to an exasperating fashion, are strung together at the end of the volume. Who can be expected, in the age in which we live, to have conscientiousness enough to look out in their proper places about two-score notes to each of half-a-dozen lectures? So far as we can observe, the translator has done his work well, though he might have looked more sharply after his printer. The form *Donauesschingen* is decidedly preferable to either *Donaneschingen* or *Donaveschingen*, which are offered for choice; and the forms *Poenitère* and *Veugéance* are equally distressing. Still further additions to the notes might of course be suggested on almost every page; thus we must express our surprise that in connexion with a German dialogue on the sickness and final testament of the Mass no reference should have been made to so well-known an English "treatous" as that commonly called *The burying of the Mass in Rhyme*, recently edited by Mr. Edward Arber in his admirable series of Reprints. It is of more importance that Professor Hase's editor not only permits him to quote uncontradicted the spurious declaration of the Blackfriars Players of the year 1589, but actually leaves the note untouched in which the German author innocently supports his quotation by a reference to Mr. Payne Collier's *New Facts*. This alone would suffice to show that Professor Hase does not write about the drama as a specialist; whereas the odd simplicity of the historical observation on the same page as the note referred to, that "in spite of the violence of his opinions Prynne never became a warm adherent of Cromwell," is of Jacksonian origin, and may perhaps be excused by the necessities of compression.

Although we cannot perceive any commanding necessity for the publication of this translation—which is too heavily weighted with incidental learning for a mere series of popular lectures, while, on the other hand, its incompleteness leaves it of doubtful value for students—yet we only give the book its due in describing it as both full of interesting matter, and fresh and spirited in the manner of its composition. Professor Hase's reputation has been gained by him as an ecclesiastical historian and theologian of the rationalistic school, certainly distinguished by clearness of exposition, and, if we rightly remember an anecdote which used to be current at Jena, wont to enliven his academic discourses by sallies of epigrammatic wit. To judge from the lectures before us, he seems to have retained his fondness for a joke; although, perhaps agreeably to the usual character of witticisms *ex cathedrâ*, some of Professor Hase's have rather an ancient flavour about them. We should at the same time observe that these lectures, though dealing with a theme in which it seems difficult to avoid both giving and taking offence, are written from first to last with perfect good feeling and good taste. It is needless to say that he is not concerned, as a divine, either to inveigh against the theatre or to defend it, or to offer for it that kind of half-apology which has been received with surprising thankfulness in our own country, to the effect that not all plays are vicious, nor all actresses such as Theodora was before she became an empress. The problem which he discusses in his concluding lecture and illustrates throughout the series is nevertheless a curious one, and has by no means always met with the same answer at different periods of the history of Christendom. Can and shall the Church and the theatre make direct use of one another?—for an indirect relation between two forces acting upon mankind is of course inevitable. Only very gradually has modern civilisation, in so far as it has favoured the stage at all, arrived at the conclusion which Professor Hase summarizes at the close of his last lecture, that the true union of the two forces does not lie in their identification. While the theatre has sought to dogmatize, and even to proselytize, the Church, where she has not regarded the theatre as "a chapel of Satan," has at times been fain to look upon it as "a portion of her own sacred building." There is, accordingly, doubtless a wider significance than the worthy King Frederick William III. intended in the rebuff which he administered to the faithful Bishop Eylert, when the latter had ventured to warn His Majesty that his subjects would [illegible]—

"The King can remain three hours, or even more, in the playhouse, but he never favours us with so long a time in the church." The King answered kindly: "I am glad to find you so frank. At the same time you must forgive me for saying that is rather an unmeaning remark of yours. You have compared two things which are not in the least alike. In the theatre one is amused; in the church one prays and seeks to be edified. Now it is easy to be entertained for hours, but one can only be earnestly devout for a short time.

King Frederick William III. was a man of honest but small mind; indeed Dr. Hase notes that he "was quite satisfied with insignificant pieces"; and he would perhaps, like our own King George, have thought plays of a different stamp "sad stuff." But he was quite right in pointing out that edification requires a responsive effort which few men can afford at a theatre—at least, unless edification and amusement are in some way combined together. It [illegible]cisely this attempt which was made by the mediæval [illegible] and which, as it is one of the chief purposes of Professor Hase's lectures to show, is traceable even in later phases of the Christian drama than those to which the Mysteries, Miracle-plays, and Morals belong.

It seems unnecessary, after what has been already said, to make any further reference to the account given here of the relations between the Church of Rome and the stage in the middle ages. We must however protest, in passing, against the astounding statement that the Latin comedies of Hrothswitha "are in servile imitation of Terence." Undoubtedly Terence was the writer by whose enduring literary success the pious authoress professed to be shocked, and against whose comedies she, with modest daring, sought to pit her own; but, in reality, the latter differ from their nominal models in form almost as much as they do in spirit. In connexion with the public miracle-plays in general Professor Hase notices the custom of the whole company of actors kneeling down on the stage before the commencement of the performance to sing the hymn "Veni Creator Spiritus." This usage, which recalls the "God Save the Queen" at our opera-houses, seems to have been occasionally observed even after the Reformation; the choice of the hymn accords with its singular popularity and with the tradition which ascribed its authorship to Charles the Great. Noteworthy, again, and unfortunately again not without its modern analogies, is the circumstance that in many pieces (apparently of the early French religious drama) "the places where the Fool is to speak are merely denoted '*stultus loquitur*,' without any words." It is questionable whether, even for Shakspeare's fools—seriously as he objected to the low comedian's undying privilege of gag—the whole of what they were expected to speak was "set down for them" by the playwright. Much else that is suggestive will be found in Professor Hase's first lecture; but in the second he enters upon ground which will be new to a greater number of readers. Undoubtedly the Renaissance, which heralded the Reformation, was destined both to bring about the beginnings of the regular modern drama and to extinguish its predecessor—the religious drama of the middle ages. But the process, as is known, was a slow, and long an incomplete one, in England, where the cause of the New Learning inspired as much of the stage literature of the early Tudor period as that of the Latin Church herself; and Professor Hase shows how gradually it was accomplished in Germany also, where both sides of the religious struggle likewise found advocates on the popular stage. In Germany, however, the Reformation availed itself of the aid of the drama with a promptitude and a vigour hardly observable in the same degree in England; so that the history of the German stage in the sixteenth century forms no unimportant part of the great movement in progress throughout the national life. Professor Hase has given some interesting illustrations of this phenomenon; for a clear sketch of the history of the early German drama, accompanied by selections of plays, his translator might have referred the reader to Gœdeke and Pittmann's excellent series of *German Poets of the Sixteenth Century*, now in course of publication. Among these poets the most prominent place of course belongs to Hans Sachs, of whom Professor Hase well observes that "he seems to have felt no embarrassment in transporting his Lutheran belief into the very midst of his mediæval material with only a pious sentiment of the most general kind, or possibly with no object at all but that of gratifying his naïve delight in describing and composing." With Hans Sachs it has pleased Professor Hase to contrast, in a very suggestive lecture, the author of *Nathan the Wise*, which he defends against the specious charge that, under the pretence of equal fairness to the three religions, it is really unfair to the Christian. The argument is very temperately conducted; but there is a balancing manner about this part of the lecture which leaves the reader in something like suspense at the close. We notice, by the by, that with the story of the three rings, which Lessing borrowed from the *Decamerone*, is here compared the plot of a Lutheran polemic play acted at Eisleben shortly before the outbreak of the Thirty Years' War, written by Martin Rinckart (the author of *Nun danket alle Gott*), and called *The Christian Knight of Eisleben*. In this play the leading personages are Peter, Martin, and John—a curious, though of course far from extraordinary, coincidence with the names of the brothers in the *Tale of a Tub*, which has been supposed (in a most ingenious essay by Professor Caro) to have helped to suggest to Lessing the theme of *Nathan the Wise*.

In the lecture on the "Sacred Drama in Spain" Professor Hase is on ground well trodden, but of unique significance for the point of view from which he treats his subject. For it is in Spanish literature alone that the sacred Christian drama was cultivated with the highest literary success; in France, as the author shows in another lecture, the regular drama, even in its few earlier attempts on sacred themes, followed antique models. Nowhere did the drama more completely free itself from contact with the Church, although one famous production of Corneille's and two of Racine's are thoroughly entitled to be called religious plays. When we reach Voltaire we feel that he had as much right to call *Zaïre* a Christian play as to call *L'Orphelin de la Chine* a Chinese one; for the rest, Dr. Hase puts the matter neatly when he observes that

Voltaire, during the first decade of his brilliant career, seems rather to have hated the Church, in whose principles he had been educated by the Jesuits, than Christianity itself; indeed to this latter, which he never understood, he bore at no time a consistent hatred.

GERVASE OF CANTERBURY.*

GERVASE of Canterbury is a writer who from the circumstances of his life might have won for himself a foremost place amongst the historians of his own and even of other times. His life seems to have been spent within the walls of the cathedral convent; and his profession as a monk was made at the feet of Archbishop Thomas not many months after the latter had been consecrated to the primacy. But of the momentous struggle which ended in the murder of Thomas and his canonization Gervase has little to say; of the less important, though scarcely less bitter, conflict between the monks of Christ Church and the Archbishops, which broke out afresh after the death of Thomas, and was carried on with singular pertinacity by Archbishop Baldwin, he says perhaps too much. At least he fails to see things in their true proportions, and events of greater significance are dwarfed by prejudices which tend to make the interests of his conventual home the paramount interests of the world. His enthusiastic devotion to the society of which he was a member first kindled in him the desire to leave behind him a conclusive vindication of the monks; and to the narrative which he was thus induced to write he subsequently made additions which turned it into a chronicle of the reigns of Henry and Stephen and the first two Angevin kings. From this history Dr. Stubbs has, with the singular exactness and almost unerring judgment which mark all his work, brought together incidental statements which give us a fair picture of the personal life of Gervase. The evidence thus obtained enables him to refute the theories which have identified Gervase with other writers of the same name, and to assign to him his true value as an historian. This value is increased rather than lessened even by the peculiarities, which may not unfairly be regarded as demerits, of his work. The age was rich in historians who achieved a real greatness; and if for events of which he had personal knowledge Gervase chooses to cite their narratives almost without change, he admits their authority more effectually than if he had told the story in his own words.

It is strange that, apart from the great controversy between the monks and the Primate who was formerly their abbot, Gervase has very little to say about events which must have stirred his deepest feelings as a monk. He belonged to a convent which, more perhaps than any other in the land, was mixed up with the interests and controversies of Christendom, and he entered it just when the King and his old Chancellor were about to engage in deadly battle. The fact that he could refrain from writing down the occurrences of Becket's memorable pontificate while they were yet fresh in his mind, shows that he had not at starting any definite purpose of becoming an historian. Of his life before he became a monk nothing is recorded; and a reference to Vacarius as lecturing on law at Oxford has been rightly regarded as insufficient proof of the notion that he might have been trained in that University. If when he received orders from the Archbishop he had only just reached the canonical age, he was born probably about the year 1141; and the character and career of the great prelate with whom he was thus brought into contact would, we might suppose, give a strong impulse to the historical instinct of a young man of twenty-three if he had any within him. But we have no evidence of literary activity on his part for more than twenty years after this time; and of Thomas of Canterbury he tells us little from his own personal recollection, although the language which he uses towards him is that of enthusiastic veneration. After a most careful sifting of all the materials which can throw any light on the history of Gervase, Dr. Stubbs comes to the conclusion that he lived and died a simple monk of Christ Church, having probably seldom been beyond its walls except when he left them to plead the cause of his fellow-monks in the great quarrel with the Primate. That he was not present at the Archbishop's assassination is almost a certainty. Had he been so, he would have mentioned the fact, especially as he is careful to tell us that he was present on the next day at the burial. When at length his purpose of relating the controversy with Archbishop Baldwin was expanded into the idea of a more extended history, his recollections had lost much of their freshness, and he preferred to make use of existing materials. In so doing he shows that he was dealing with events of which he had personal knowledge. In Dr. Stubbs's words, "even the errors of arrangement which may be detected in it seem to be the errors of a man misled by an effort of his own memory. Gervase's narrative, then, has the value that belongs to confirmative evidence; he, having been on the spot and seen some part of what he records, deliberately *gives* an account of it in borrowed words." Four years after the martyrdom the cathedral was burnt; but his narrative of this calamity was not committed to writing until eleven years had passed away after the event. In the interval he may have been busied with inditing some of the many letters which went forth to the world from the cathedral convent on the subject of the great quarrel. These "Epistolæ Cantuarienses" were published in the series of the Master of the Rolls in 1865; and the circumstances under which they were written, as well as the lessons conveyed by the controversy, were carefully examined and set down in the Introduction. The language of some of these letters is in close agreement with that of Gervase's chronicle; and there seems to be nothing against the inference that they were from the pen of Gervase himself.

That a writer whose long life as a monk was so seldom broken by visits to the outer world should be a thorough monk, with no very strong feelings apart from the interests of his convent, is only what we should expect. With these interests nothing is allowed to interfere; where these are not concerned he can speak and write heartily on the side of the Archbishops; and, more especially, he can become their champion in their controversies with the neighbouring abbey of St. Augustine, with the monks of Rochester, or with the secular power. It was the great strife with Baldwin which in the end made Gervase a chronicler; and the nucleus round which his work gathered was furnished by two cases, if the legal phrase may be used, which he drew up—one on the side of the Archbishop, the other on that of the convent. The former is termed an "Imaginatio," the latter a "Responsio" on the part of the prior. These are followed by an historical exposition of the question of internal administration, and by a recapitulation of the whole controversy addressed to the Pope. Dr. Stubbs rightly regards as untenable the theory that these documents may have been essays, composed years after the event; and urges that, on this supposition, it is not

> easy to explain why these episodes should have been first treated in the Chronicle on a scale so disproportionate not only to the general history of the time, but to the other particulars concerning the fortunes of the monastery. They could on this theory have appeared in their completeness only in a minute chronicle of the convent; but Gervase's Chronicle is so far from being a complete chronicle of the convent that he does not even give the exact or carefully dated sequence of the priors of his own time.

The language of Gervase is seldom, indeed, so precise as to justify historical inferences which are based only on particular expressions. In the year 1193 he was sacrist; four years later he speaks of Felix, whom he styles sacrist of Canterbury, as appointed to the priorate of St. Martin's, Dover. It might be supposed that in the interval Gervase himself had been at St. Martin's, and this conjecture might receive some countenance from the passage in which he disclaims all ambition of being ranked amongst professed chroniclers, inasmuch as he writes not for public libraries, but for his brother Thomas and his poor little family—"tibi, mi frater Thoma, et nostræ familiolæ pauperculæ." It seems strange and, as Dr. Stubbs remarks, "scarcely reconcilable with sincere humility," thus to characterize the great, rich, and powerful community of Christ Church. But, although the expression might suit the smaller society at Dover, the list of priors, which is complete for this whole period, makes it certain that Gervase was never numbered among them. We must therefore conclude that the phrase denotes here the cathedral convent. From this point we have nothing to illustrate the personal fortunes of Gervase. His life was prolonged into the reign of John, and he proposed to relate the story from the death of Richard in the second book of his Chronicle; but Dr. Stubbs adds that there is no proof that this second book was ever written. If it was written, it has been lost; but Gervase speaks of the lessons which by the "grace of God" may be drawn from his relation of the troubles of the church of Canterbury as given in that book, and this is a sure sign that the book existed only in the mind of the author. He wrote, however, after completing the first part of his Chronicle, which is published in the volume before us, "a compendium of the history of the British Kings, of the Anglo-Saxon dynasties, and of the Norman and Angevin reigns down to the reign of John; to be followed by a history of Canterbury and its archbishops to the time of Hubert Walton." Subsequently he wrote a small tract on the political and ecclesiastical geography of Britain, adding to it "a somewhat scanty 'Provinciale' of the Catholic Church," giving to the whole the title "Mappa Mundi." These treatises will form the second volume of the present work, and the full examination of them is reserved for the Introduction to that volume. In the meantime the editor expresses his opinion that Gervase himself probably brought down the "Gesta Regum" to the year 1210, and that, although it is possible that they may have been an abridgment of a larger continuation of the Chronicle, it is more likely, in the absence of any proof of the existence of such a continuation, that "we have in the Gesta rather notes made in preparation for a continuation than an abridgment of such a work."

The exact date of his death is not known. The obituaries of the convent contain the names of three monks called Gervase, commemorated respectively on the 1st of January, the 14th of March, and the 30th of April; but there is nothing to indicate the year to which they belong, or which of these three was Gervase the Chronicler. The question whether Gervase is to be identified with some one of several writers bearing this name is more important; and Dr. Stubbs has examined it with a fulness of learning which leaves no room for doubting his conclusion. That he was not the same as Gervase of St. Ceneri, in Alençon, is proved by the later date at which the Canterbury chronicler made his monastic profession; that he was not the Gervase of Chichester mentioned by Herbert of Bosham as a young scholar who among others attached himself to Thomas Becket, is shown by the fact that the latter was not a monk, and that he is known as the author of a commentary on Malachi, of which our chronicler makes no mention in the list of his own writings. But without following the editor through his exhaustive arguments, it is enough to say that the attempts to identify him with any other writers of his own age must fail in face of the fact, already noted, that the whole evidence at our com-

* *The Historical Books of Gervase of Canterbury.* Vol. I. Edited from the manuscripts. By William Stubbs, D.D., Hon. LL.D., Canon-Residentiary of St. Paul's, &c. Published under the direction of the Master of the Rolls. London: 1879.

as a simple monk who from the time of his early manhood spent his whole life at Canterbury.

For the general character of his narrative it may be said that his honesty may be clearly discerned through his prejudices. There may be a suppression of facts, but there is no distortion of them. Of the former we have a notable instance in the singularly meagre account of the reign of Richard, except in so far as it immediately affected the convent. Like his father, he is an object of dislike to the chronicler, although the former is spoken of with more bitter vehemence. The deaths of both were judgments for their sins against the Christ Church monks. The captivity of Richard is mentioned with evident satisfaction. The story of his last days is related without pity. It was not enough that Richard on his death-bed should protest that if he had done any harm to the church of Canterbury it must be ascribed wholly to the suggestion of others.

If we turn to contemporary events not bearing on the fortunes of the convent, it is not easy to find from the narrative of Gervase their true relations to the history of the nation. It is quite certain that if this had been the only source of information accessible to him, Thierry could never have drawn his picture of William of the Long Beard. In the pages of Gervase William is a criminal whose acts are almost too shameful to be mentioned, and whose purpose is nothing less than the destruction of the State. The miracles performed after his death were speedily stopped, he says, by the scourging of those who were the witnesses or the recipients of them; but Gervase forgets that the application of such a test would stop miracles in other places scarcely less effectually. In the narrative of Matthew Paris William is a man who was done to death because he told the truth and maintained the cause of the poor—"pro assertione veritatis et pro causâ pauperum tuendâ"; and the historian adds emphatically that, if the cause makes a martyr, William had established his claim to the title. But, as the editor remarks, the prepossessions of Gervase are so transparent that they cannot mislead the reader, while in the general faithfulness of his history we have "a sort of subsidiary evidence, by no means to be despised, to the more worthy treatment which the period has received from other historians."

VIDA.*

VIDA is a curiously pleasing book. It answers exactly to the description given in its second title, "Study of a Girl"; and in the history of the girl of whom Miss Dunsmuir has made the study there is nothing more exciting than the fact that she is motherless, that she is hardly appreciated by her father, and that she receives three offers of marriage. Yet in the two volumes which make up the book there is so much simplicity and earnestness, such truthful exposition rather than analysis of character, that the faults which the work possesses are easily pardoned in consideration of its somewhat quaint and agreeably old-fashioned merits. Foremost among these faults we should be inclined to place the introduction of a long religious dialogue, which occupies the whole, or nearly the whole, of a chapter in the second book. But when this has been said it is only fair to add that in this there is no touch of the kind of offensiveness which too often belongs to such matters when they are put into the pages of a novel, or rather of a "tale"; for *Vida* is described much more naturally by that old-fashioned nomenclature than by any modern name. The thing is, to our thinking, a mistake in art, and, strictly speaking, in taste, although the phrase "bad taste" cannot, in its usual and condemnatory sense, be applied to Miss Dunsmuir's work, the very simplicity of which saves it from such a reproach. The author would have done better to meddle no further with the religious condition and theological difficulties of her heroine than she does in some passages of the first volume, where, lightly touched upon and exhibiting with truth a phase through which most young people of any marked intelligence pass, they seem to be not out of place. If, however, the chapter to which we have referred is a mistake, it is one which need not excite any feeling stronger than regret; and there are, we believe, some readers who like to take their fiction and religion in a mixture. Vida's views are at any rate not disagreeably narrow, as may be judged from the fact that her first spiritual difficulty arises from horror and surprise at the Divine vengeance which is recorded to have overtaken Uzzah. Another mistake is the introduction of two entirely needless deaths—one of them that of a singularly attractive character; but here also criticism is to a certain extent disarmed by the evident fact that nothing can have been further from the writer's mind than bringing them in for the sake of effect. They are related quite simply as actual facts might be related, and of course it is only by dint of practised skill or of unusual instinct that a writer can command the manipulation of probable facts which is demanded by what may be termed the *optique du roman*.

Davida—or, as she is generally called, Vida—Callander is the motherless daughter of a minister who has his dwelling in the beautiful Scotch island of Arran. There is something pathetic in her first appearance when, conscious of her loneliness, she tries to make friends with some of the village children and join in their sports. "'Your name is Jeanie Millan, isn't it?' she asked of the eldest—a girl slightly older than herself. 'I see you are going after nuts. Will you let me go with you?' Jeanie looked as stupid and awkward as only a Scotch child can look, and after waiting some time replied, with downcast looks, 'If ye please, mem. We canna hinder you.' The spirit of the reply was so different from what Vida expected that it provoked her somewhat. 'Don't call me *mem*,' she answered, a little sharply." The end of Vida's undertaking is not more happy than its beginning. Leaving the other children to the enjoyment of some "cookies" which she has bought for them, and which they are too shy to eat in her presence, she seeks out a solitary nook to indulge that sorrow which, the author says, "is the peculiar luxury of childhood; there is nothing to qualify and nothing to complicate it." Descriptions of such incidents as this, dwelling on childlike feelings and perplexities, are not easy things to handle. It is to the writer's credit that her sentiment is never maudlin, and that touches which may be called trivial or even puerile in themselves have their value in relation to the development of a character which is singularly attractive. Whether Miss Dunsmuir is wise in leaving readers to form for themselves an idea of the dead mother from whom—on the reversed principle of "C'était donc monsieur votre père qui n'était pas si bien"—Vida must have inherited her nobler qualities, is possibly open to question, at any rate as regards the tastes of those readers who like to have everything fully explained. For our own part, however, we are well content with the pleasure we have derived from following Vida through the various phases between childhood and womanhood.

Mr. Callander, Vida's father, is a man who, if not soured, is at least dried up by disappointment, and who, though like Launcelot Gobbo he is "kind enough," has no comprehension of or sympathy with his child's feelings and nature. Thus practically her only companion and guide is the devoted old nurse Nannie, to whom reference has already been made as a personage whose death is needlessly brought in. The monotony of Vida's existence is, however, broken presently by the arrival of two ladies—Mrs. Hope and her daughter Mrs. Stanley—who have taken a large house hard by the minister's dwelling, and who duly call at "The Manse," a civility which Nannie instructs her "bairn" to return without loss of time. There is not a little humour of a semi-pathetic kind in the description of Vida's carrying out this command. "Why should they come here?" she has asked of her oracle Nannie, and has received for reply, "Weel, I daresay they ken that Mr. Callander's the minister, and they think it's a proper respec' to ca'. And now that they've dune that, Viday, ye canna dae less than gang up the morn, and ca' upon them." The call has its terrors and difficulties for Vida, who is arrayed in strange fashion for the occasion by Nannie; but the child's innate ladylikeness carries her through. "I think I have stayed long enough now," she says at the end of it, "gravely appealing to Mrs. Hope's superior knowledge"; and when Mrs. Hope expresses a polite wish that they may meet again, she replies, "I will come back whenever you like. I like very much to look out of these windows; at home we can't see so far, because the house is lower down and the wood comes in the way. But the wood is pretty too." Mrs. Hope is as much pleased as her daughter Mrs. Stanley is displeased with Vida. The one thinks her forward and designing, the other simple and straightforward. Vida's judgment on them, delivered to Nannie, is, "I liked Mrs. Hope; but Mrs. Stanley is rude. I don't think she's a real lady. . . . She laughed at me two or three times." "Hoots, bairn," replies Nannie, "ye maun hae been sayin' somethin' fulish." Vida answers, "I don't think so; but even if I did, she should not have laughed till after I went away." The importance to the story of the episode of Mrs. Hope's and Mrs. Stanley's arrival in Arran lies in the fact that they bring with them a boy, by name Arthur Kennedy, grandson to Mrs. Hope, and nephew to her daughter. With him, while he is fishing, or trying to fish, one morning, Vida falls in, and the two soon strike up a firm friendship. The absolute hopelessness of Mr. Callander as a father for such a girl as Vida is well brought out in connexion with this. He gives her a note from young Kennedy, of which she tells him the purport:—

> "It is from Arthur Kennedy to say why he could not walk with me on Wednesday because he had a friend with him, and they went up Goat Fell, and he seems to have been tired; but he says he is better now, and will come some day soon instead."
>
> "I do not feel quite certain," said Mr. Callander slowly, "that you ought to walk about with Arthur Kennedy, Vida."
>
> Vida looked up in frank and blank surprise.
>
> "I mean," said Mr. Callander, wondering why he could not prevent his eyes from falling, when Vida's were so steadily raised, "I'm not quite sure that it is quite the thing to do."
>
> Fortunately Vida caught no glimmering of his meaning.
>
> "I don't think Arthur would do it unless it was the thing to do," she said innocently. "He has no brothers, or sisters either, and that is why we like one another."

Mr. Callander, thus baffled, takes counsel with Nannie on the subject, and gets nothing from her but a merited rebuke. "These," he says to her, "are evidently people of position, and I should not like the idea of our forcing——" "And gin they be," Nannie replies, "gin they be in any position ye like, a' I can say is, that they're a' the mair shootable for Vida to ken. My mistress's dochter needna hing her heed afore onybody. And for Viday, though she's gey wilfu', and tak's little thought, and though I canna gar her fauld her claes, and her sampler's nae farrer on than it was at Christmas, she can come forrit, and tak' her place wi' the best o' them. I'll say that for her, though I wadna feel mysel' free to say 't *till* her."

* *Vida: Study of a Girl.* By Amy Dunsmuir. 2 vols. London: Macmillan & Co.

The friendship between Arthur and Vida continues then, in spite of the constant efforts of Mrs. Stanley to put a stop to it. Arthur gets much good both from the air of Arran and the unconscious influence of Vida, and in the following summer he insists upon dragging his good-natured grandmother back to Carrachan. Then comes the inevitable change in the position of the boy and girl. On the last evening of his second visit Arthur recurs to the promise made between them the year before, to be always brother and sister, and proposes with boyish eloquence that they should be lovers instead. That, Vida says, she knows nothing about. "Well," continues Arthur, "you know what *sweethearts* are, don't you, Vida?" To this she makes the somewhat disconcerting reply, "Yes, I think I do. They are people who do silly things. They hold one another's hands, and they go out and walk together all alone. Everybody laughs at them. They are foolish sort of people." Arthur replies to a practical remark of hers, "As to changing our minds, I shall never change mine; I can never like any other girl as much as you; and I thought you would have felt the same." To this Vida answers with charming simplicity that the cases are somewhat different. Arthur has seen a great many girls, and can tell which he likes best, but she has seen scarcely anybody. "I do like you *very* much, but you are the only boy that I know, and so I can't tell whether I should like you best, if I knew the others. And when I grow up and go to Campbelton and Glasgow, I might see some one even nicer, and I might be sorry I had promised. Don't you see?" The interview is closed by Vida's bursting into a fit of laughter at Arthur's asking for a withered rose which she has been wearing during the evening.

The story of the book is, as we have hinted, slender; and we will not spoil the enjoyment of people who cannot bear a book without a story by revealing what befalls Kennedy, Vida, and the other characters, after Vida has come to years of discretion. A word of praise, however, must be given to the drawing of one character, Mr. Jeffrey the minister, who plays an important part in the second volume, and who has not yet been mentioned. There is no violent excitement in *Vida*, and therefore there are probably some novel-readers who, to use an old-fashioned phrase, will not "taste" it. We have, we hope, said enough to recommend it to persons who are satisfied without battle, murder, and sudden death. The book has much merit and more promise.

TWO BOOKS ON SOUTH AFRICA.*

IF we have paid somewhat dearly for our campaigning in Zululand, and if the annexation of the Transvaal appears a questionable speculation, at all events and by way of compensation, they ought to extend our acquaintance with Southern Africa. Here we have two more books on the subject, and both decidedly readable; though that of Sir Stephen Lakeman takes us back to the former Kaffir war, while Captain Parker Gillmore deals with recent history. The latter gentleman, who must be more or less familiar with most quarters of the globe, is favourably known to readers of South African literature as author of *The Great Thirst Land;* and he has always exciting adventures to describe in lively, if somewhat unstudied, language. When our troubles with the Zulu King broke out, and our invading forces were fairly set in motion, it occurred to Captain Gillmore to place his experience and services at the disposal of the War Office. It may have been among the surprises and sensations of his adventurous life when the authorities promptly closed with his offer. Equally promptly he reported himself in Natal, presenting himself at headquarters to receive his instructions. The mission he undertook was a dangerous one, and certain to entail extreme hardships. He was to make a tour among the independent chiefs of Bechuana Land, and endeavour to obtain men and animals for our transport service, which threatened to collapse altogether.

In more settled times he might have counted confidently on a civil reception from the native potentates; and he would have been all the more hospitably received because he travelled with a well-filled purse as an accredited agent of our Government. On former occasions he had hunted over much of the territory, and several of the chiefs were old acquaintances. But, for the moment, circumstances had changed. The unsuccessful beginning of our operations, and the disastrous affair at Isandula, had shaken the faith of the Bechuanas in British ascendency. Already some of the tribes were thinking of casting in their lot with Cetewayo; and sundry Boers who had settled to the northward among them were trekking towards the colony in extreme alarm. The money in Captain Gillmore's possession and his weapons might decide some kraal of savages to make a victim of the solitary Englishman. He carried no other property to tempt their cupidity. He had not even a change of clothes; and a couple of sleeping blankets was his entire outfit. He had neither ox-waggons, nor bales of cotton goods, nor boxes of beads, nor a troop of attendants. He travelled with three or four horses, which he cast and changed from time to time; sometimes he was accompanied by a couple of after-riders, or by a single one, as the case might be; while occasionally he failed to engage a follower and had to ride absolutely alone. He describes the country he visited as a flat table-land, elevated some five thousand feet above the sea-level. Much of it is desert or scrub-covered wilderness; here and there he came upon park-like expanses of picturesque rolling ground, abounding in various kinds of game and timbered with clumps of acacia. Now and again there were isolated koppies—"excrescences from the surface of the plains, regular in outlines, though composed of a jumble of gigantic fragments of rock." In these koppies, which are so many natural fortresses, the kraals of the chiefs were generally situated; and the land around them was more or less cultivated. The first part of his long ride lay through the sparsely settled frontier districts of the Transvaal. Even there the travelling was by no means agreeable; the Boers naturally regarded the Englishman with anything but friendliness; and once at least when he sought their hospitality, he was repelled by a barricaded door and a rifle projected from an upper window. Even at the inns, where his wants were fairly well supplied, the bills were extortionate; and we greatly doubt whether he can have saved anything considerable from the pay and allowances he received from the War Department. The first Kaffir village where he entered on the objects of his diplomacy was Linkani; and there he had a foretaste of what awaited him elsewhere. The people of Linkani were Christianized and half civilized: he was hospitably entertained in the house of a Danish missionary, whose lines seem to have fallen in pleasant places, for the description of the bungalow-like residence in orchards swarming with turtle doves and singing birds stands out like the picture of an earthly Paradise. But there was political strife in the community, embodied in the persons of a couple of rival chiefs. In African fashion, they interposed formal delays to the business interviews, and the interviews ended by their declining to part with any of their people. They excused themselves on grounds more or less plausible, but Captain Gillmore surmised that neither of them cared to weaken his following in presence of a competitor who might take advantage of the opportunity. On other occasions, indeed, such reasons were frankly alleged. Chiefs who were at chronic feud with their neighbours could not afford to invite an attack by detaching a portion of their fighting men; and they feared besides to provoke the vengeance of Cetewayo, in the event of the white men having the worst of the struggle with him. The chiefs of Linkani, if they did not assent to Captain Gillmore's proposals, set no obstacles in the way of his departure. Elsewhere he found himself repeatedly in very critical situations; and could only extricate himself from the circles of insolent savages by audacity backed up by a display of his revolvers. More than once, he had warning that he was to be waylaid on his departure; and from one village he was forced to ride for his life, having changed his proposed route after leaving the huts behind him.

Apart from the chance of being assassinated, the actual dangers of the road were serious enough. One night in particular, which he passed in a tropical rain storm—rain of any kind being phenomenal in that district—was marked very unpleasantly in his memory. With his two attendants, he had failed in reaching the water they had been steering for, and having come upon some bushes and broken sticks, had decided to light a fire and bivouac. In utter weariness he had fallen asleep to waken almost immediately and find himself covered with ants. Having stripped off his clothes, it took him a full half-hour to free himself from his tormentors by the help of his attendants, when his "wounds had to be carefully smeared with a piece of fat." Notwithstanding the smart, he went to sleep once more, to be woke again by the rain coming down in a deluge. Then he took refuge in a little cart he had with him, where he was speedily "saturated as a sponge," and so chilled that his teeth chattered. He had soon an opportunity of restoring the circulation. His horses took fright at some nocturnal animal —which proved afterwards to be a lion—broke their fastenings, and bolted into the darkness. Immediate pursuit was necessary. Captain Gillmore ran till ready to drop, toiling through the sand after his Hottentot lad; when he was left behind, in the pleasant belief that he was lost, out of sight of the fire and beyond call of the cart. By a happy chance, at that moment he heard his boy's voice, who had just then come up with the horses; but, even with the aid of the native's sagacity, they had the utmost difficulty in retracing their steps. Next morning he was suffering from a violent attack of fever; one of his boys "was doubled up with pains in the stomach"; they had nothing for breakfast but some bu[illegible]bok meat; and, to crown all, after the deluge that had poured on them for hours, they could not find a drop of drinking-water. "The thirsty soil had drunk it all up." Throughout his forced marches the scarcity of water, as may be supposed, caused him far more suffering than any superfluity of it, though fording the rivers was sometimes awkward. Before taking leave of him, we may notice an adventure which nearly brought his journey to a premature conclusion, while at the same time it is a pleasing illustration of the kindness which may sometimes be met with in an African kraal. At that time he was riding homeward alone, having just buried his only attendant in the wilderness; and his own health had so utterly broken down that he began to make up his mind to the worst. He decided that his best chance for safety was to make a bold push for the nearest Kaffir station, across sixty or seventy miles of uninhabited country; although the odds seemed in favour of his missing his point, if he did not drop on the way. On the second day, after long and weary riding through desert covered with thorny scrub, he seemed to have made no progress. His strong and plucky little horse was staggering and stumbling under him, and no wonder. Neither horse nor rider had

* *On Duty: a Ride Through Hostile Africa.* By Parker Gillmore, Author of "The Great Thirst Land," &c. London: Chapman & Hall. 1880.

What I Saw in Kaffir-Land. By Sir Stephen Lakeman (Mazhar Pacha). Edinburgh and London: Blackwood & Sons. 1880.

drunk that day or the day before. After sundown he hit on a recent waggon spoor which guided him to the kotla of the old chief [illegible]. The reception was characteristic. The group on which the Englishman intruded gave no sign of welcome, but continued cowering round the fire, though one of them handed him a gourd when he asked for water. In dismounting he sank exhausted to the ground, and then the king and his people raised him, while the former whispered the word "welcome." After that he had nothing to complain of. They nursed him carefully, and treated him most generously, even going the length of giving him a jorum of hot toddy, made from a bottle of precious Hollands gin. Thanks to his courage, tact, and resolution, Captain Gillmore came back in safety to the colony to write his entertaining volume; and we may add that, with his long acquaintance with the country, he heartily approves the annexation of the Transvaal.

What Sir Stephen Lakeman saw of Kaffir-Land was seen, as we have said, more than thirty years ago. Having been with the French staff in some of their Algerian campaigns, he had fallen in love with the Minié rifle. On his return to England he had several interviews on the subject with the Duke of Wellington; and when war broke out at the Cape, he volunteered for service there, on condition that the men under him should be armed with his favourite weapon. The offer was accepted, though clogged with the condition that he was to raise two hundred men himself, and arm them with the Minié at his own expense. Sir Stephen, then a very young man, and apparently with as much money as enthusiasm, took shipping straight away for the Cape. There Sir Harry Smith took him cordially by the hand; offering an additional bounty of 2*l*. per head for each man he might enlist. The story of the recruiting is amusingly told; and surely, since Falstaff mustered the company for his march through Coventry, there never was a more motley or a more disreputable corps. Not a few of them were notoriously escaped convicts; others enlisted under pressure from the police, who had offered them the alternative of military glory or a prison; while the ranks were positively swelled by a contingent of the halt and maimed. Most of these gentlemen took the liberal bounty with the firm resolution of limiting their operations to the pot-houses of Cape Town. It was only by a masterly strategical manœuvre, and by the active exertions of a corps of sturdy blue-jackets, that they were swept up after a field-day on the beach and stowed away on board a transport. Once pushed to the front, they appear to have behaved creditably. But, though Sir Stephen and his men were repeatedly praised in General Orders, he owns frankly that they often owed their "honourable mention" rather to good luck than to good management. On the first occasion when they covered themselves with laurels some steady shooting from the Kaffirs had nearly thrown them into utter confusion. "I ran to the front and shouted out, 'We shall all be shot if we remain here in the open! To the bush, my lads! to the bush!'" So they charged gallantly forward into the bush by way of seeking cover. The tables were turned, and the natives "skedaddled." Sir Stephen attributes his successes chiefly to his system of making night attacks; for "the Kaffir, lithe, supple, and vicious as a snake during the heat of the day, loses much of his treacherous energy at night." A crime perpetrated by one of the smartest and most trustworthy of his non-commissioned officers is significant of the stamp of men he commanded. A certain Sergeant Herridge took a fancy to a singular necklace of teeth worn by an old Kaffir woman. The old lady declined to part with the ornament, whereupon the sergeant dogged, waylaid, and murdered her, as he confessed afterwards on the deathbed to which he had been brought by his remorse. One of the most interesting chapters is that which gives an account of an interview of Sir Stephen with Sandilli, the celebrated fighting chief of the Gaikas who has since caused us so much expense and anxiety. To do Sandilli bare justice, Sir Stephen's narrative illustrates his consistent patriotism. Though, on the intervention of a favourite sister, he consented to meet the English commander, he never sought to conceal his feelings of animosity. Indeed the meeting threatened to end in bloodshed, when, at a sign from the English commander, a sergeant in attendance brought the muzzle of his gun, "as if by accident, somewhere near Sandilli's head." Necessarily the story of Sir Stephen Lakeman has lost something in interest by long keeping; yet his experiences of bush campaigning and his knowledge of Kaffir nature make it entertaining reading even now.

SISTER DORA.*

THIS is a record of a noble, though not a perfect nor perhaps altogether a beautiful life. And Miss Lonsdale has told her story well, giving us both the good and the bad, or rather let us say both the strong and the weak points, in the character and conduct of her heroine; for bad is not the word to apply to some blemishes in a really grand character and a life devoted with unsparing energy and self-sacrifice to the bodily and spiritual service of her fellows. A lady who visited Sister Dora at Walsall, where she had then been nursing for seven years, describes her in 1872 as "a tall, black-haired, handsome woman, brimming over with fun and energy," who picked out the humorous side of everything, and was as fascinating a woman as she had ever met, but adds—what will appear in the sequel to have been a just criticism—that "she would not make as good a second in command as she does chief, being human and taking an ardent pride in her own good management, which she is much too transparent and open-hearted to hide." And her biographer frankly points out how this feeling of pride or jealousy made her refuse to appoint any deputy when she left her own work for a time to take charge of an Epidemic Hospital, merely telling her pupils to divide the work among them and do their best till her return. She was even tempted to betray "an unworthy dislike" of those who showed any special capacity for filling her place; and the same proud temper made pity intolerable to her, so that in her last illness two of her sisters, who had come to her, were obliged after a week's stay to take a sorrowful leave, because "from her almost frantic desire for the concealment of her complaint (cancer) she would not allow them to nurse her." We have purposely noted at starting this obvious, though very intelligible, failing, which was the more conspicuous from the childlike frankness and transparency of her nature. But it must not be taken for more than it is worth, and still less should it blind us to the genuine nobility of her character and work as a whole. It would be a great mistake to call her masculine, though she took far more kindly, as is not unusual in such cases, to the nursing of men and boys than of her own sex, and gained a wonderful influence over them. In spite of her religious profession, the precise nature of which is not very clearly indicated, she twice received offers of marriage, and on one of these occasions we are told that some members of the Sisterhood at Coatham, to which she then belonged, as well as other friends, urged her to accept it. But she had resolved to devote herself to a different career, for which she unquestionably had very remarkable aptitudes, though towards the end of her days she was heard to say, "If I had to begin life over again, I would marry, because a woman ought to live with a man and to be in subjection." To be in subjection was however just what she could least endure, and it may well be doubted if domestic life would have been her most appropriate sphere; it was anyhow a sphere to which from the earliest age she manifested a marked and almost obstinate repugnance.

Dorothy Pattison, daughter of the Rev. Mark Pattison, and sister of the present Rector of Lincoln College, Oxford, was born at Hauxwell Rectory in Yorkshire in June 1832, being the youngest but one of twelve children. While still a mere girl she gave a prognostication of that speciality at once for nursing and for winning and influencing boys which became so prominent in her after career:—

> While she was travelling abroad, a schoolboy in the village, who was specially attached to her, fell ill of rheumatic fever. The boy's one longing was to see "Miss Dora" again, and as he grew worse and worse, and still she did not come home, he constantly prayed that he might live to see her. On the day on which she was expected he sat up on his pillows intently listening, and at last, long before any one else could hear a sound of wheels, he exclaimed, "There she is! there's Miss Dora!" and sank back. She went to him at once, and stayed with him, nursing him till he died.

In 1861 she finally left home, much against her father's wishes, and worked for three years as parish schoolmistress at Little Woolston, near Bletchley, but this was only a temporary experiment. In the autumn of 1864 she joined the Sisterhood of the Good Samaritans at Coatham, and early in the following year was sent to nurse in a Cottage Hospital at Walsall, a town of "the Black Country," where, with a few short breaks, the remainder of her life was to be spent. What her work there was it is the main purport of this biography to explain, and the tale does certainly read in parts almost like a romance, though we see no reason to question the accuracy of Miss Lonsdale's statements. But one hardly knows whether to marvel most at the moral or the physical power and manual dexterity of the versatile and ubiquitous Sister. Let us give a few specimens. A fine healthy young man was brought into hospital one night with his arm torn by a machine, and the doctor said it must be amputated at once. Sister Dora declared she could save it, if he would let her try. He told her she was mad, but if she chose to have the man's death on her conscience, he should neither interfere nor help her. She did save the arm, which was always thenceforth called "Sister's arm." Years afterwards, when she was very ill, the young man walked over every Sunday from the place where he worked, eleven miles off, to inquire for her. When the servant answered his vigorous pull at the hospital bell, he asked "How's Sister?" and having got his answer said "Tell her that's *her* arm that rang the bell," and walked back again. The setting of fractures and drawing of teeth, when no surgeon was present, were common operations to her, but she never touched a wound or set a fracture without first uttering a prayer. The doctor she worked under described her physical strength as gigantic. When a huge collier fell out of bed, she picked him up like a baby and put him back again; on one occasion a delirious patient, "a tall, heavy man, in the worst stage of confluent smallpox," sprang out of bed howling and rushed to the door, whereupon she grappled with him, got him back into bed, and held him there by main force till the doctor arrived in the morning. When a boy, who had chopped off a finger, came to the hospital, she sent him home to fetch the finger, set the fracture, and the surgeon testifies that it healed perfectly. One night the doctor, as a forlorn hope, performed the operation of tracheotomy on a child in the last stage of diphtheria; "Sister Dora knelt down by the bed, put her mouth to the incision, and deliberately cleared the child's throat of the poisonous mucus which was choking it," so that it recovered. And Miss

* *Sister Dora*. A Biography. By Margaret Lonsdale. London: C. Kegan Paul & Co. 1880.

Lonsdale assures us "it is a fact that she was in the habit of bringing back to life patients who had sunk into the first stage of the fatal collapse which so often precedes death from smallpox by actually putting her mouth to theirs, and breathing into them, until vitality was restored."

But if her bodily strength and nerve was wonderful, her moral courage was more astounding still. Several stories illustrating this are given, as for instance how in one of the most infamous quarters of Walsall she flung herself between two wild Irishmen engaged in a bloody fight, with whom the police dared not interfere, and they at once desisted; and how on another night she entered a public-house of such repute that "she hardly knew whether she ought not to expect to be murdered there," to attend a man wounded in a fight, and every hat was taken off as she appeared on the scene. A wonderful story is told of her pioneering the clergy during a mission at Walsall into one of the worst slums of the town, in the hope of rescuing some of the fallen women congregated there. We reproduce the narrative as it stands in Miss Lonsdale's pages, as an example of the kind of work of which Sister Dora was capable, though the accuracy of the particular story has been contested, apparently on good grounds:—

As Sister Dora passed this place with her two companions, a policeman stopped her, saying, "Hadn't we better be near, Sister; it's an ugly place?" "Oh," she said earnestly, "on no account; it would spoil all; they must not think we are afraid." As the three missioners turned down a narrow court, the most disreputable of all the neighbourhood, the Sister spoke to the clergy, "Now keep close behind me. I am safe enough, but *your* lives are not worth a moment's purchase if you are seen down here without me to protect you." They followed her, and she paused at the door of a small house brightly lighted, through the window of which she bade them look, taking care at the same time not to be discovered.

They saw a circle of women sitting round a table, evidently receiving orders from an ill-looking man, who appeared to be master. Sister Dora knocked at the door, and received at first no answer. She knocked again, and a man's voice growled, "Who's there?" "Sister Dora," was the answer. A volley of oaths was the next sound, coupled with the question, "What do you mean by coming here at this time of night?" She merely answered, "Open the door—it's Sister; I want to speak to you." The man got up swearing, and did as she told him. She stood in the doorway, looking with infinite compassion upon the scene before her, and exhorting the man as follows: "Why, Bill, what possesses you to treat me like this? Don't you remember what you told me the last time you came up to have that head seen to?" Growls from the man, and muttered oaths, was the rejoinder; with orders to "be quick, and say what she wanted." "I'll tell you what I want," answered Sister Dora, advancing into the room, and holding out her hand, first to one woman and then another: and as they crowded round her, she addressed them severally. "Well, Lizzie," or "Mary, how are you?" and "I've seen you before—did up your arm last winter twelvemonth—but I can't put a name to you;" or, "You came up to see me two months ago." Then, speaking to them all, "I want you all to go down on your knees with me now, this moment, and say a prayer to God." To the utter amazement of the two clergymen, the whole party, the man as well as all the women, knelt with Sister Dora, while she offered up aloud a prayer from the depths of her heart, for her "brothers and sisters" who were gathered there with her. As the man rose from his knees, he turned to her in a shamefaced manner and said, "I'm very sorry, Sister, I was so rude to you. I didn't mean it; you've been good to me." "Then," answered she, quickly, "if you're sorry, will you do what I ask you?" "That I will," replied he. "I want you, and all these women here, to come with me into a room we have got hard by, and to listen to something some friends of mine have to say to you there." Bill at once prepared to obey her like a little child, and most of the women followed his example.

The two clergymen had vanished into the little mission-room, which was soon filled. But they had scarcely begun their service when a rough fellow pushed his way in, accompanied by some women, and set to work shoving and nudging those who were already there, and jeering at them with coarse bitterness. "Bill" turned to Sister Dora, by whose side he sat, and said imploringly, "Make him be quiet, Sister; now do." She rose, and saying authoritatively, "Now then, Jack, none of that. Come and sit you down here by me, and behave yourself." The dignity of her appearance and manner entirely quelled his savage nature, and as meekly as a lamb Jack came to her side, and the service proceeded, she seated between the two ruffians, who, under ordinary circumstances, would have thought little of murdering anybody who had thus dared to interfere with them.

Her young patients seem to have called out all the tender side of Sister Dora's character, and we are told that "she always had a devoted slave in some boy, whose ailments kept him a long while in the hospital," and for whom she was sure to have some humorous sobriquet. But we must leave our readers to study for themselves the history of "Sam," "Cockney"—whom she cured of "that worst of all scepticisms, a disbelief in human goodness"—and the rest of her young favourites. Another side of her character was exemplified in the tact with which she guided the Hospital Committee. The want of habitual intercourse with cultivated minds like her own was evidently a trial to her, or would have been, had she not been so wrapped up in her patients and her work. And considering that, apart from regular cases of disease, "scarcely any twelve hours passed in which some workman did not appear, scalded from a boiler, or, what was far worse, by molten metal," her work was pretty incessant. And it was maintained unbroken to the last. She refused to succumb to the fatal disease which was preying on her vitals, and her doctor was strictly enjoined to observe absolute secresy as to its real nature, so that "Her'll get well" was the general verdict of Walsall within a few weeks of the end. It was not till the August of 1878 that she consented to go away for a holiday, and in October she returned to die. Two months of lingering agony were still before her, borne with exemplary cheerfulness and patience, until at length on the afternoon of Christmas Eve she peacefully passed away. On the following Saturday, December 28, she was carried to her grave, according to her own wish, by eighteen railway servants whom she had nursed, while a vast procession, headed by the Mayor and Corporation, and including many hundreds of her old patients, followed for a mile through drizzling rain and half melted snow to the little cemetery chapel. The general desire of the working men of Walsall to have a statue erected to her memory was explained by one of the railway servants in a few simple and touching words, which convey fairly enough the feeling of those among whom she had lived and laboured devotedly for thirteen years:—

Why, nobody knows better than I do that *we* shan't forget her—no danger of that; but *I* want her to be there, so that when strangers come to the place and see her standing up, they shall ask us, "Who's that?" and then we shall say, "*Who's that?* Why that's *our* Sister Dora."

There are plenty of self-called female apostles in the present day, of whom Sister Dora was never one, ready enough to prate about what they call "woman's rights." They might be better employed in trying to learn the noble lesson she has bequeathed them of the reality of woman's work.

DAVIES'S METALLIFEROUS METALS AND MINING.*

WHETHER from a scientific or a commercial point of view, the study of metalliferous minerals and mining processes is one of ever-fresh and deepening interest. Copious as is already the literature devoted to the subject—much of it of the highest order — there is still room for a book bringing together in a concise and systematic manner the results of discovery and research carried on at different periods and in widely separate fields, concentrating into a common focus the rays of light which physical science, history, or practical economy may severally be found to contribute. With this view Mr. D. C. Davies has been led to undertake a work descriptive of the conditions under which metals and metallic ores are found in the different countries of the world, explaining in the first place the origin and constitution of such deposits, and in the next defining the zones occupied by the various metallic ores, with the view of somewhat lessening the amount of unsuccessful search for them. By means of the data thus supplied, together with the figures, quantities, and other statistics contained in the book, the commercial conditions of mining may, he thinks, be better defined. The leading principles of scientific research, as well as of economical management, being thus made good, and illustrated by a sufficiency of representative details, while the reader is furnished with references to sources whence additional information may be derived, a valuable service is rendered by Mr. Davies's little volume to those engaged in the profession of mining.

The author begins with a short survey of the primary materials of which the crust of the earth is known to be made up, amounting in all to about 600 species. These, however, it is found, resolve themselves on further analysis into some 63 simple elements, which cannot at present be further subdivided. For additional light on the distinction or the combination of these simple substances the reader is referred to works specially dealing with the subject, especially in its connexion with mineralogy. Of the 63 elementary substances, broadly divided, 48 are metals and 15 are non-metals; 5 of these being gases. Many of the whole number are of very rare occurrence in nature, the bulk of the earth's crust being made up for the most part of the five gases and the non-metallic minerals, oxygen and silica being the preponderating substances. It is with the metallic minerals that the present treatise is concerned, and from among these our author selects for description, on account of their utility in ordinary life, first, those included in the group popularly known as the noble or precious metals—gold, silver, platinum, iridium, and palladium; and, secondly, those making up the group of useful metals—copper, tin, lead, zinc, iron, nickel, mercury, bismuth, and tellurium. Coal-mining, it will be observed, does not come within the scope of his treatise. The student is taught to distinguish the two states in which metalliferous minerals occur in nature. In the native state they are found unalloyed with other, especially non-metallic, substances, and consequently pure and ready for use. In the more common mode of occurrence, save in the case of the so-called noble metals, they are mineralized, or associated with other minerals, and in combination with the gases or earthy admixtures. In this state they are known as ores, distinguished by the prevailing ingredient of the mixture. When mixed chiefly with oxygen the metals are called oxides; when with sulphur, sulphides; and when with chlorine, chlorides; all of which are more particularly dealt with as the book proceeds. An excellent table of strata sets before the eyes of the learner the order in which the various rocks making up the earth's crust lie upon each other, and the names by which the different groups of them are known to geologists; from which he is taught to select those in which metallic ores and mines may be looked for, confined as these are in general—with the exception of iron, more rarely copper, and occasionally one of the noble metals—to the series below the coal measures. Their great depositories consequently are the Laurentian, the Cambrian, the Silurian, the Devonian, and the Carboniferous strata, which make up the great mountain chains of the world. Tracing the principal lines of these mountain masses, which have, roughly speaking, a general direction from north-east to south-west, doubtless determined by the primary conditions of the

* *A Treatise on Metalliferous Metals and Mining.* By D. C. Davies, F.G.S., &c. London: Crosby Lockwood & Co. 1880.

earth's shrinkage, our author indicates the connexion which is generally found to hold good between the mountain groups and the mineral treasures of which he is about to treat; all the great deposits of metallic minerals being constituents of these mountains, or being met with in the valleys and ravines by which they are [illegible], as well as in the detritus accumulated during long ages in the hollows that furrow their sides and in the plains that stretch [illegible]ong their feet.

All known deposits of metalliferous minerals being classified, as (1) lodes, comprising fissures and veins; (2) beds, or stratified deposits, and crystallised masses; (3) irregular deposits, including [illegible]sional veins, and disseminated ores; and (4) super[illegible] deposits, comprising detrital gold, stream tin, bog iron ore and cupreous deposits, Mr. Davies goes in detail into the causes to which these modes of distribution of the mineral masses are due, illustrating the geology of the subject by typical examples from all parts of the world. The nature of fissures and lodes, with the way in which metallic veins are found interjected, and the methods of following disjointed strata, will be clearly understood from the accompanying sections and diagrams, for which he is indebted, as he informs us, to his son Mr. E. H. Davies. The illustrations throughout the work are accurately and artistically drawn. We would particularly mention those in Chapter III., showing crystals or rounded masses embedded in the rocky mass, ores of lead, blende, manganese and iron contained in the interstices, or quartz and micaceous slate entering in parallel lines into the structure of the lode. The most attractive part of the book will probably be that which treats of gold and silver deposits, in which the history of the best-known and most valuable mines or reefs is traced, the various processes for the extraction or accumulation of the metals in different countries and under various geological conditions are enumerated, and the commercial or economical statistics of their produce brought together. Sections are given to show the different conditions under which gold is usually found, which to the eye of the geologist go far towards indicating with certainty the prospects of successful or unsuccessful mining. Though perhaps the most widely diffused of all metals, it is but in few places that gold is found to repay the cost of working or extracting, and of the most renowned and oncé thought inexhaustible sources of supply, many have long since ceased their yield. The tales of India's gorgeous wealth seem well-nigh fabulous now that Golconda is barren of gold. Nor does the highest yield of the Mexican or Peruvian mines come within any appreciable approximation to the reports of Cortez and Pizarro. The yields of European gold-fields in our day are rapidly run through in our author's summary; the most hopeful of these, that of the Ural mountains, showing a total of no more than 66,966 pounds for last year, there being a progressive falling off since the year 1847, when a maximum of 75,000 pounds was attained. The history of gold-mining in Great Britain will be read with interest. Vestiges are still found of the Roman workings at Gogofau, west of Llandovey, in South Wales, in the large quartz veins that traverse the slaty strata of Arenig or Upper Cambrian age. To the present day the sacred thirst for gold has kept at work some enterprise of the kind in the Principality, which has always been known as the richest gold region of Britain. Ireland must have been of old time a near rival, to judge from the weight and splendour of Irish gold ornaments, such as those which form the noble collection of the Royal Irish Academy. The wonders of Californian and Australasian mining receive ample justice in Mr. Davies's pages, which include a notice of the prospects opened up by the recent discovery of auriferous deposits scattered over the wide region between the Zambesi and Cape Colony. Should the fears sometimes entertained of a failure of the world's supply of gold threaten to realize themselves, our author is prepared with the suggestion that some simple invention may be found whereby the sea-sands of the shores of auriferous countries, like the black sands of the Californian and Oregon coasts, might be made to yield readily and cheaply the particles of gold they contain.

Of European silver mines the most celebrated is that of Königsberg, in the south of Norway, first opened in 1623, and still worked at a profit. The ore in this mine, as shown in our author's diagram, occurs not so much in true lodes as in a succession of partly decomposed rocks known as fahlbands or rotten belts, of which layers there are seven interstratified with gneissic and slaty rocks. They extend over a length of several miles and a breadth of about one thousand feet. The total annual yield of Norway is set down at about 20,000 lbs. Troy. In Great Britain, though there is not a single silver mine proper, there is a large amount of this metal extracted from lead, chiefly in the Isle of Man, where the Cambro-Silurian strata yielded in 1876 103,332 ounces of silver from 2,500 tons of ore. The carboniferous limestones of Northumberland, Durham, and other northern counties are also productive of small quantities, samples of the tin ores of Alston Moor having yielded as much as eighty ounces to the ton. Of all silver mines in the world the most important is the Great Comstock lode of Nevada, of which Mr. Davies gives an interesting sketch. More ample accounts of this gigantic enterprise are to be obtained from the original Report of Baron von Richtofen, put forth in San Francisco in 1866; the magnificent volume of Clarence King and James D. Hague, forming part of the great United States Survey; and its valuable supplement, in the more recent work of Mr. John A. Church, published at New York. Our author's sections shew the various lodes piercing the syenitic rocks at the base of the series, and the conglomeritic beds intersected by dykes of trachytic rock. The main lode has been followed four miles, and some thirty-five mines have been opened in its course, the most successful of them being the Great Bonanza. The Sutro tunnel, which took nearly ten years in making, has just struck the lode in the Savage mine, draining the whole to a depth of 2,200 feet, and displaying the multifarious strata, which are made clear by the section in fig. 40. In less than twenty years this mighty system of veins has yielded, according to our author, 40,000,000*l.*, or, as Mr. Church reports, not much short of 70,000,000*l.*, in silver and gold, there being in the natural mixture, on the average, six per cent. of the more precious metal to ninety-four per cent. of silver. A new shaft is said to be in contemplation, to a depth of 4,500 feet. Other representative lodes or groups of mines are the Eureka deposits of Eastern Nevada and the Emma Mine of Utah. Despite the unenviable notoriety which it has gained by years of litigation, the latter mine is shown to subserve the author's purpose of illustrating the different geological conditions under which silver deposits occur in the earth's crust, and the corresponding differences of working that are rendered necessary.

Our author treats next in succession the ores of copper, tin, lead, iron, and the less prominent metals, passing on to the various methods and appliances used in mining and metallurgy, with the modes of ventilation and draining. The application of machinery in aid of the miner's industry is adequately noticed. The history of mechanical contrivances for rock-drilling or boring may be carried back a century and a half, but it was to Richard Trevethick's rotary drill, worked by a weight of 500 lbs., that the first practical success in this direction was due. Other inventions in America and on the Continent, as well as in Great Britain, led the way to the great advance of M. Sommeiller, whereby the driving of the Mont Cenis Tunnel was so rapidly expedited, the motive power being compressed air. The rock-drilling machines now in use are divisible into two main classes—those which bore by constant pressure and rotation, and those which bore by percussion combined with a rotatory movement. As the typical example of the first group, Mr. Davies takes the Diamond Rock-Boring Machine of Messrs. Beaumont and Appleby, consisting of a hollow shaft driven rapidly by steam or otherwise, and terminating in a crown or disk of iron set with diamonds. Of the manifold varieties comprised in the second group our author has selected for illustration the Schram machine, in which the drill is worked either by compressed air or steam, with great economy of motive power and effectiveness and stroke; the Ingersoll drill, easily portable, and directed against the roof or sides of a mine; and the Jordan and Victor hand-power drills, in which the boring tool is lifted up by cams, and forced back by a spiral spring. Illustrations are also given of recent improvements in stone-breaking and stamping machines made by Blake and Scholl, as well as in ore-dressing machinery by the continuous automatic crushing mill of Mr. George Green. Some important statistics are added, showing the comparative results of work in different mines under various methods of operation, with the cost of mining and dressing the ores. The book ends with some useful hints towards the classification of unprofitable mines, pointing to the probable causes of failure and to the prudential principles to be kept in view with respect to the purchase and sale of mines, and to speculation in mining property generally.

FRENCH LITERATURE.

A HASTY reader might perhaps imagine that a series of annual reports, reprinted from the Transactions of a learned Society, would not supply very interesting reading except for persons who had more or less claim to the title of specialists. The two volumes of the late M. Mohl's *Rapports* (1) ought to make any such reader change his mind. They may be said to be almost perfect specimens of the *compte rendu.* For twenty-seven years the learned Orientalist laid before his colleagues of the Asiatic Society of Paris these documents, which comprise an obituary and a brief survey of the publications of the year in Oriental literature and study. The notices both of books and men are admirable, and have the distinctness and lack of monotony which are at once the two chief things to aim at, and the two most difficult things to secure in such matters. The consequence is that, even at this distance of time, and even to a person not specially acquainted with the subject, they are attractive and interesting. Among the obituary notices many curious items will be found, such as the biography of the Hungarian savant Alexander Csoma, a kind of modern Coryat without the charlatanism, who spent his life in wandering about the least known parts of the East, and refused all communication with Europe, and all recognition by European bodies. The book is introduced by a short preface from the pen of M. Renan and a biographical notice from that of Professor Max Müller; but its intrinsic interest is fully sufficient without this heavy metal of recommendation. Indeed in Professor Max Müller's notice we could have spared a very unnecessary digression, in which the writer endeavours to prove that the credit due to Sir Henry Layard and Sir Henry Rawlinson in connexion with Assyrian exploration is overrated in England.

The fourth and last volume of M. Baudrillart's *Histoire du*

(1) *Vingt-sept ans d'histoire des études orientales.* Par Jules Mohl. Paris: Reinwald.

luxe (2) is perhaps the most interesting of the four. It covers the period from the beginning of the seventeenth century to the present day; and, as before, is chiefly occupied with French manners and customs, though other nations are by no means neglected. In this period many subjects of the first interest naturally occur for treatment, such as the conflict of opinion between Henri IV.'s advisers as to the propriety of making France a conquering nation with an external policy, or an industrial nation with a policy of commerce and trade; the attempts made by Louis XIV. and his Ministers to unite both ideals, represented respectively by Louvois and Colbert; the time of the building mania at Versailles and Marly; the "culpable luxury" of the Regent and Louis XV., &c. &c. M. Baudrillart's moral appears to be that, in point of luxury, as of other things, the *privatus census* should be *brevis*, the *commune magnum*.

It is a pity that M. Duquet (3) has not mastered the very simple proposition that to magnify your enemy is the best way to enhance your own victory and to minimize your defeat, while the vilifying of the enemy magnifies his victory, and makes the defeat of the vanquished more disgraceful. Another simple truth, which also, in common with many of his countrymen, he has yet to learn is that it is always ungracious to make a dead set, under the guise of writing history, at a particular person. The book before us is simply a long *plaidoyer* against Marshal MacMahon, while at the same time the author loses no opportunity of accusing the Germans of cruelty, general brutality, and even strategic incompetence. He has a real faculty for military history-writing, and could hardly fail (with the observance of the above simple rules) to produce work of very considerable value; but at present the animus and the childish petulance of his work can only disgust impartial readers.

There have been some doubts in England as to the claim of pedagogy to be recognized as a science, nor do we think that this Dictionary (4) will do much to reconcile the unbelievers. Here, if anywhere, we should expect to find an explanation of the mysterious term; but the Dictionary of Pedagogy does not present to the anxious inquirer much more than the appearance of a very cheap and a very handy encyclopædia, which might just as well have borne that more familiar and intelligible name, except that, at the end of the different articles, there are lists of questions to assist in getting up the subjects. We are almost afraid that if the book—which, be it repeated, is really a useful encyclopædia—had appeared in England some irreverent reviewer would have dubbed it the Dictionary for Crammers. Its information is exactly of the stamp that an instructor of youth, driven hard by an inconveniently inquisitive pupil, would find useful. Perhaps the title is a misprint for "Dictionnaire des pédagogues."

General Favé's treatise (5) is one of those books which as compositions have doubtless been of service to their authors, but which cannot be said to have any particular *raison d'être* for the reader. The General goes through the history, legendary and authenticated, of the Republic and the Empire, and draws such morals as occur to him.

Nos chambres hautes (6) is an argument, not devoid of interest, for the retention of Second Chambers in the colonies. The author's chief weakness is an unbridled affection for notes of exclamation.

Le cléricalisme (7) is a very fair sample of the nightmares of those Frenchmen who are haunted by the *spectre noir*. Give the Church her way for a century, says M. Depasse, and you shall see France in full feudalism—a state of which he proceeds to give terrible accounts. M. Depasse supposes that the complete separation of Church and State will save his country from this and other dangers.

In a curious book (8), partly consisting of reminiscences, partly of arguments, and partly of comments on other men's works, M. Eugène Nus endeavours to show the Spiritualist faith which is in him. The first and the most interesting part is a record of table-rapping and turning which M. Nus and some of his friends experienced about twenty-seven years ago. The profane will probably remark the statement that the *illuminés* on this occasion were all fervent young Republicans who had been deeply shocked by the *Coup d'état*, and who, by M. Nus's own account, were evidently in that state of half-exaltation and half-depression which physiologists tell us is most favourable to delusions and hallucinations. The latter and historical portion goes as far as the Slade business, and lays great stress on the testimony of a certain "M. Oxon, Professeur de la faculté d'Oxford." M. Oxon is, according to M. Nus, a man of the greatest intelligence and veracity.

Not many more gigantic literary tasks have recently been attempted than the Dictionary (9) of which M. Frédéric Godefroy has just issued the first *fasciculus*. The absence of anything even approaching to a satisfactory lexicon of old French has long been a trouble to students of the language, the glossaries of Roquefort, Burguy, &c., being altogether insufficient. M. Godefroy's work is intended to occupy some eight mighty quarto volumes; and, to judge from this first part, it will be of inestimable value. The distinguishing characteristic is the abundant citations from authorities, manuscript as well as printed. The fulness of these is such as to entitle it justly to the name of a Thesaurus of the older tongue.

France has waited a good many years before devoting anything like an elaborate critical study to her eccentric Encyclopædist, and truth compels us to say that M. Scherer's *Diderot* (10) is hardly a compensation for so long a neglect. Compared with Mr. Carlyle's brilliant essay, with Rosenkranz's exhaustive book, and with Mr. Morley's elaborate examination of the philosopher and his set, it is in the highest degree thin, poor, and weak. Perhaps M. Scherer, who has always been a kind of belated Classicist, is not quite the man to examine *con amore* one who was in some ways the father of all the Romanticists of France. It is particularly unfortunate, too, that the foolish etiquette which makes Frenchmen ignore all foreign criticism of their literature has prevented him from profiting, at least openly, by the remarkable *corpus* of Diderotian criticism already referred to. His own remarks are almost always sensible, and up to a certain point correct, but they show no particular grasp of their subject and no particular faculty of expounding it.

Two books of travel covering nearly the same ground are always interesting to read, not merely because of the different view they give of the localities, but also because of the light they throw on the idiosyncrasies of the authors. Prince Lubomirski (11) is a traveller of the practical order, with a very strong dislike for discomfort of any kind. His indications of hotels and such like things will be of service to intending followers over the same route. The lady who writes under the name of Louis Régis (12), on the other hand, is rather of the sentimental and picturesque order, and her descriptions of things and places are sometimes of considerable merit. The Russian Prince's book—he out-Herod's Herod in point of French Chauvinism, it should be observed—covers a rather wider space of ground in its subject than the French lady's, containing not merely sketches of Algeria, but a rather interesting account of the less visited Tunis.

Among scientific books we may notice the second volume (13) of an elaborate and freely illustrated treatise on chemistry, pure and applied; the twenty-third issue (14) of the useful *Année scientifique*, by M. Figuier; another instalment (15) of M. Amédée Guillemin's accurate and interesting popular astronomical works; and two parts of the *Bibliothèque utile* (16), one of which also deals with astronomy, while the other handles the ethnology of Africa and America.

There is no very obvious connexion between English and Slav literature, nor are the treatises which M. Hallberg has united in one volume (17) conceived on anything like the same plan. We can only suppose that his sketch of English and American literature did not quite make up the volume, and that it therefore seemed good to the publisher to pad it with a short review of the literature of the Slavs. As to the English part of the book, it is done with excellent intentions, no doubt, but hardly according to knowledge. Such statements as that the *Canterbury Tales* are imitated from the *Decameron*; that Swift's *Drapier's Letters* "contiennent tous les arguments invoqués depuis par les révolutionnaires et les socialistes de tous les pays"; and that De Quincey was not merely a prose writer, but a "poète souvent estimable," are fatal to any high idea of M. Hallberg's first-hand knowledge of English literature.

In *La Russie et le Nihilisme* (18) M. Frédé shows a considerable knowledge of his subject, when he has once succeeded in getting free from Germany, which, he says, produces the majority of the criminals of the United States, Brazil, Mexico, and the English Colonies, and is besides permeated with a disgusting odour of rusty bacon. His Russian views, though not unworthy of attention, are tinted with a similar pessimism.

Les nouveaux conseils de l'enseignement (19) is the first of a series of Parliamentary papers, issued under the superintendence of one of the Clerks of the Chamber, which are likely to prove useful to students of French contemporary history.

In *La jeunesse de Fanny Kemble* (20) Mrs. Craven has taken

recently issued *Records of a Girlhood*, and has translated pretty numerous extracts, accompanying them with a running commentary. The object seems to be to see how far the theatre might be made a moral force. Mrs. Craven finds in the life of her heroine rather discouragement than encouragement for this notion, all the more so that her admiration for Miss Kemble is great.

Mrs. Audley has added an interesting volume (21) to the many lives of musicians recently written by ladies. She is an enthusiastic defender of her hero, and inclines to think him very badly treated by George Sand.

Prose translations of lyric poetry are not things which can be spoken of with indiscriminate approbation. But M. Aulard's translation of Leopardi (22) has this advantage, that it is introduced by a very long preliminary dissertation, biographical and critical, on the poet of pessimism, who has not hitherto been very fortunate in meeting with expositors out of his native country.

M. Quantin's elegantly printed *Bibliothèque des romans* has been enriched with a reprint of Furetière's *Roman bourgeois* (23), a production of no first-rate literary merit, but useful and interesting for the light it throws on manners in the palmy days of the seventeenth century in France. Two less sumptuous reprints of the work have previously appeared of late years, and the issue of a third shows the singular demand for old books which now characterizes the French book trade.

We may group together three volumes of sketches of the light *feuilleton* kind which is still to a great extent an *article de Paris*. M. Vallery-Radot's book (24) is an attempt to show that the French student of to-day is a much more respectable being than his forerunners, though he may be considerably less picturesque. Mr. Matthew Arnold's theory of the "Ishmaelite" character of the French is fiercely, though unwittingly, opposed by M. Vallery-Radot, who holds that the student is rapidly "ranging" himself, and that he will soon become as moral as a German without the German fancy for mutilating his companions' countenances. "For the first time for eighty years," he says, "nous aurons une génération saine d'esprit et saine de cœur." This consummation does not seem to have been fully reached yet, if we may judge from *Chut!* (25), which, however, is not so scandalous a book as its title might lead readers to expect. It is simply a collection of the miscellaneous stories, jokes, *nouvelles diverses*, and so forth, which fill up the pages of the *Figaro* and of most other Parisian papers.

Arnold Mortier's *Soirées parisiennes* (26), which have now been issued regularly for some years, are also reprints of the theatrical criticisms of the *Figaro*.

The first number of the *Revue de l'histoire des religions* (27), the object of which is sufficiently explained by its title, contains articles on divination in ancient Italy, on the religious monuments of Cambodia, &c., besides useful bulletins of the literature of various subdivisions of the general subject. A paper of interest on the Basque "Pastorals," or miracle plays, also deserves notice.

M. Duprez is fortunately able to write his own biography (28). The life recorded does not perhaps contain any events of very striking interest; but the book illustrates well enough the joys and woes, the triumphs and disgusts, which await a public singer.

M. Henri de Bornier's new play (29) is a really solid and remarkable piece of work, displaying the same qualities as the *Fille de Roland*, but also showing decided progress in the art of putting those qualities to use. The well-known story of the manner in which the Scourge of God met his death furnishes the plot with very little amplification, except that the bride is made to deal the blow in revenge for the murder of her lover and the enslavement of her father and his people. As before, M. de Bornier has made his chief appeal to the higher moral sympathies, and to a lofty, if rather vague, patriotism. Walter, the murdered lover, is a Frankish chief, and Attila is constantly taunted throughout the play with his failure to take Paris, while in the last scene a singular spectacular device is resorted to. The captive Franks and Burgundians overpower the drunken Huns, and when the dying tyrant calls for his guards and his standard, *Le Drapeau de Lutèce* is brought in instead, and he dies in the consciousness of falling by a woman's hand and of his former repulse by St. Geneviève. The verse of the play is unequal, but not seldom rises to a very creditable stamp of Alexandrine, suggestive of Corneille rather than of Racine, though of course not without Hugonic echoes here and there. At present, we should say, M. de Bornier's weakest point is character-drawing. His Attila somewhere says that he does not choose that any one should understand him, and in truth there is not much danger of his undergoing this ignominy. His general behaviour reminds one of the words of another stage tyrant—"I'll do 't to show my arbitrary power." Attila is always doing it to show his arbitrary power, and it is frequently a very incomprehensible "it." So also the minor characters rarely display the distinctness of complexion that is desirable. Perhaps the rarest excellence both of novelist and dramatist is the faculty of making everybody and everything work together to bring about the *dénoûment*; certainly M. de Bornier has not yet fully attained this.

An unusually long list of novels contains also an unusual number of contributions from distinguished hands. The two ladies who write as Henry Gréville and Th. Bentzon deserve first mention for other reasons than the traditional *place aux dames*. Though both have perhaps been praised enough by their admirers, there are few among the younger novelists of France who can be compared with them. *Cité Ménard* (30) is one of the best, if not the best, of its author's works, and M. Sandeau would not, we think, have been ashamed to sign it thirty or forty years ago. The fortunes of the inhabitants of the Cité, an *insula* on Montmartre, with, as a central point, those of the good angel of the community, the sempstress Cécile, are very charmingly told. *Georgette* (31), on the contrary, though a book of considerable literary merit, is spoilt to English taste by the extravagance of its theme. A mother who finds that a *liaison* in which she has been engaged for years injures the chances of her daughter in life, and therefore conveniently drops herself into a crevasse, is not a sublime object at Dover, whatever she may be at Calais—to retort a criticism of M. de Saint-Victor's on Swift. *Le grandpère Lebigre* (32), which contains more stories than one, is a fair specimen of the lighter work of the famous collaborators. Whether MM. Erckmann-Chatrian might not be better employed at such a conjuncture as the present than in stirring up popular hate against the Jesuits is a question; but the volume is not wholly occupied with denunciation of the black militia. M. Henri Rochefort's book (33) is not a particularly interesting novel; but it has traces enough of its author's peculiar vein of caustic wit to save it, and the picture of New Caledonia is a curious study in black without any white. In *Le crime de Martial* (34), a sequel to his recently noticed *Château des épines*, M. Ulbach has once more attempted tragic sentiment and sensational incident, and has succeeded very fairly. The way in which the events of 1870-71 are brought in is superior to any previous employment of them that we remember in a novel.

M. de Boisgobey (35) has given an interesting story of the old *régime* in *L'héritage de Jean Tourniol*; and M. Allard a good and healthy study of modern *bourgeois* life in Paris, under the title of *L'impasse des couronnes* (36). *L'étang des sœurs grises* (37) is again tragical, and not representative of favourable moral conditions, but it opens with a well-told legend explaining the title. The author of *Aziyadé* has supplied in *Le mariage de Loti* (38) an account of Tahitian manners which exhibits the drawbacks of earthly paradises. There is much affectation in the book, particularly in the irritating way in which its paragraphs end regularly with rows of points, thus . . . But there is also literary talent. The tales comprised in M. Sylvin's volume (39) follow in style authors as widely removed as Bret Harte and Henry Murger, and follow them not unsuccessfully. *Les belles millionnaires* (40), on the other hand, is an ordinary novel of society, the prescription for which may be said to be a grain of Charles de Bernard and a gallon of distilled, or undistilled, water. M. Cadol's tales (41) are fair specimens of *conte excentrique* without the eccentricity being strongly marked. In *Les amours de la duchesse* (42) M. Odysse Barot has worked up his really considerable knowledge of English literature, manners, and politics, without, however, quite escaping the fate which seems to rest upon all Frenchmen who cross the Channel for their scenes and subjects. The history of the Duchess of Kennington and her clever but inconvenient son, Mr. John Marcy, whose talent is such that two London daily newspapers print a leader he has casually sent them on the same day, is to be continued. Lastly, the ingenious author who calls himself Quatrelles, and decorates his title-pages with four capital L's symmetrically arranged, has produced a book (43) not destitute either of wit or of knowledge of nature in *Les amours extravagantes de la princesse Djalarann*. These excellent qualities may perhaps partly excuse, at least in a French novel, certain breaches of good taste according to English notions.

AMERICAN MEAT PRODUCTION.—*The accuracy of the statements in the* Times *commented upon in an article entitled "English Farming and American Meat" which appeared in the* SATURDAY REVIEW *of April 10th, is, we find, contested by the London and St. Katharine Docks Company. In a letter printed in the* Times *of April 15th, the General Manager of the Company states that the apparently high charges for landing, lairage, and slaughtering cattle at the Victoria Docks are due in part to the action of the Privy Council, and in part to the charge for conveyance to Deptford made by the City authorities, in whom the sole right of such conveyance is vested.*

NOTICE.

COMING DANGERS.

THE uneasiness, amounting to alarm, which has been caused by the general election and its results is founded neither on the character of the new Government nor on the personal composition of the House of Commons, but on the action of the constituencies. The great majority of the Ministers cannot be suspected of subversive tendencies or designs, and even the most dangerous among them, who is also the most powerful, is supposed to have expressed in his latest publication a lingering tenderness for the abandoned convictions of his early career. The House of Commons, as far as it represents Great Britain, includes but few professed demagogues of the grosser kind, and the great majority of its members are, by property, social position, and habits of thought, entirely indisposed to sympathize with revolutionary measures. No Parliament could be more safely entrusted with the duties of legislation and administrative control, if only it were permanent and independent; but the instability of an equilibrium which ultimately rests on the basis of a wide popular suffrage has been conspicuously illustrated by the recent history of France. Only nine years ago the supreme legislative body was the most aristocratic of all the representative Assemblies which have been elected since 1789; and, as might have been expected, its opinions and feelings were strongly Conservative. The executive authority had with universal consent been entrusted to a veteran statesman, who, although he had at last accepted the Republic, was bent on administering it in close accordance with the spirit and traditions of constitutional monarchy. The army was commanded by a soldier of Royalist inclinations who had acquired distinction under the Empire. M. GAMBETTA, then the chief of an apparently feeble Opposition, was too harshly described by the President of the Republic as a raving madman. A decade has not yet passed, and Royalists, Orleanists, and Conservative Republicans have been deprived of every remnant of influence. M. GAMBETTA, who boasted of raising new social strata into political existence, and who has been throughout consistent in his opinions, is now regarded by a large party as a timid reactionist, although he concurs in that hostility to the Catholic Church which for the time inspires popular clamour. Experience has confirmed the warnings of those who had long maintained that the Jacobins were the only real Republicans in France. The wealthy and cultivated classes, who have, as in the United States, for the most part retired from public life, console themselves with the probable expectation that the downward course will sooner or later be arrested by the repugnance to change which prevails among the rural population. No similar check to democratic extravagance will be found in England.

In a thoughtful essay in the *Nineteenth Century*, Mr. KEBBEL calls attention to the dangers which in his opinion are threatened by the caprice of the lately enfranchised voters, and by the difficulty of anticipating their decision. The triumph of the Conservatives in 1874, and their crushing defeat in 1880, were both unexpected by ordinary politicians. The oscillation may, as the writer suggests, be repeated, with the result of preventing the continuance of any political system for more than six or seven years. It would be well if the comparison represented the whole extent of the evil. A pendulum returns to the centre, and in each oscillation it traverses a smaller and smaller arc. The movement of the present year is, on the contrary, far more eccentric than the temporary reaction of 1874; and it is nearly certain that the next disturbance will take a wider range in the same direction. The supporters of the late Government, having put forth their whole strength, were outnumbered at the polls by 19 to 15, and the proportion of Conservative members returned was considerably smaller. The upper middle classes have no force in reserve, and they have little hope of obtaining additional recruits from the masses which live on weekly wages. Even if the Conservatives had a prospect of retrieving their fortunes under the present Constitution, the cards will, before the next trial of luck, be once more packed to their detriment. The door is about to be opened for the admission of large numbers of poor and ignorant recruits, who will, with scarcely an exception, reinforce the present majority. If household suffrage and redistributed constituencies prove to be not sufficient for the purpose, there is still the resource of universal suffrage. Mr. GLADSTONE has for many years been so far in advance of his party as to have recommended the indiscriminate admission of flesh and blood to the electoral franchise. The unqualified supremacy of the poor, the total and final detachment of representation from taxation, may perhaps not be accomplished during the remainder of his political career, if the same object can be practically attained by a less revolutionary extension of the franchise. Even the transfer of county representation to the labourers will not be immediately undertaken. Happy accidents, like misfortunes, seldom come single; and the lucky Liberals have the convenient excuse of the impending Census for postponing the Reform Bill which will be necessarily followed by a dissolution. The figures cannot be published before 1882, and perhaps the consequent legislation may occupy two successive years. Five or six years may therefore elapse before the Minister of the day begins to consider whether it would be as wrong for himself as for Lord BEACONSFIELD to enter on a seventh Session. All that concerns the party is that an additional majority should be created before a dissolution.

While the constituency is becoming less capable of distinguishing the comparative merits of contending parties, its relation to the House of Commons is changing to the detriment of the Constitution and of good government. The democratic tendency to appeal from the Legislature to the multitude is remarkably illustrated in the first article of the first number of a virtually new journal, which appears as a strong partisan of the Ministers, though it disclaims a Ministerial character. In a type and a form which had been connected with other political associations, the writer assumes, apparently in unconsciousness of the novelty of his doctrine, that the English House of Commons is already subject to the popular dictation which French Jacobins vindicate under the name of "the "imperative mandate." In other words, political issues are already determinable by a popular vote, or, again to use the French term, by a *plébiscite*. The theory is applied to the particular case by the statement that the present Parliament has not been instructed to abolish the Church Establishment, so that the beneficent measure of destruction must await another general election. The present mandate, it seems, requires the extension of household suffrage to counties, the readjustment of the relations of landowners to their land, and seve-

ral minor measures. That a political writer of ability, and probably of cultivation, should have forgotten the fundamental principles of the English Constitution is a disturbing phenomenon. There are opinions against which it is useless to argue, as they imply a rejection of the common ground on which alone discussion is possible. It is true that the Radical journalist only generalizes the unjustifiable language which was employed by Mr. GLADSTONE in his menace to the Scotch Church. The Establishment was to be preserved or destroyed as the people, or the majority of voters, might determine. There is reason to suppose that Mr. GLADSTONE is not disinclined to issue a similar invitation to the assailants of the English Church. The confident political teacher who constantly expresses unhesitating judgments on the politics of Austria or Afghanistan affects ignorance and neutrality on a vital question of domestic policy.

Time will show whether any effective resistance can be offered to the democratic movement which gains fresh force as it advances. "INDEX," in the *Fortnightly Review*, does justice to the personal qualities of the leaders of both parties in the troubled time which followed the Reform Bill. PEEL and ALTHORP contributed from opposite quarters to the moderation and control of dangerous tendencies; but two years after the passing of the Bill PEEL was followed by nearly half the House of Commons; whereas there is no reason to expect that present or future constituencies will emulate the prudence of the 10*l.* householders and the substantial tenant-farmers. It may be added that there is no PEEL and no DISRAELI to restore the disturbed balance of power. The respected and popular leader of the Opposition is not likely to organize a party and afterwards to lead it to victory. From the head of the Government it would be absurd to expect reserve and moderation; and it would neither be reasonable nor dignified to count on jealousies or dissensions which may possibly arise within or without the Cabinet. If it has not been possible to satisfy every claim, those who are disappointed must be aware that the rejection of many candidates for office was unavoidable. Mr. LOWE may be supposed to be satisfied with his elevation to the peerage; and Mr. GOSCHEN was only excluded from the Cabinet by his own conscientious scruples. Some years hence, when the sycophants of power are demanding from the constituencies a new imperative mandate, it is probable that some of the moderate Liberals who are still members of the party will find it impossible to accompany their more impetuous colleagues in their further career. The next election may perhaps witness the coalition which has long been foreseen; but it is uncertain whether any part of the constituencies will share in the hesitation which may be felt by some of their present leaders.

L'ENFANT TERRIBLE.

THE son of a famous political leader is entitled at the beginning of his career to sympathy and toleration. Nothing is more natural than that Mr. GLADSTONE should wish one of his family to inherit his opportunities and some portion of his powers. If the young member for Leeds hereafter attains Parliamentary or official eminence, he will follow a long series of precedents. The first and the second CECIL, the first and the second PITT, HENRY FOX and CHARLES FOX, GEORGE GRENVILLE and Lord GRENVILLE, the second and the third Earl GREY, the first and the third Marquess of LANSDOWNE, Mr. CANNING and Lord CANNING, the late and the present Lord DERBY, are not the only instances of fathers and sons who have successively both obtained and earned for themselves conspicuous places in English history. The gift of oratory seems to be even more commonly transmissible by descent than other faculties. Bishop WILBERFORCE reminded all his older hearers of his father. The first Lord ELLENBOROUGH who had risen by forensic eloquence was succeeded by the most impressive and finished orator of the next generation. It would seem that of the rhetorical qualities of Mr. GLADSTONE, his youngest son has already attained the questionable excellence of unbounded fluency. It was said that he made more speeches in Middlesex than the present PRIME MINISTER made in Midlothian. If his statement to his new constituency at Leeds was accurate, he has also attained the responsible position of a political instructor. He found, according to his own account, that the Middlesex Conservatives, who unfortunately constituted the majority, knew nothing at all about the *Alabama* claims, the Black Sea Treaty, "and various things of that "kind." "He, therefore, took it upon himself to instruct "them, and went into the facts of the matters, after which "he discovered that, looked at from any point one chose, "the case for the Liberals was absolutely strong and un-"assailable." It is interesting to learn that the young philosopher only found himself to be in the right after he had vindicated the conduct of his party to the ignorant inhabitants of Middlesex. The extent of Mr. HERBERT GLADSTONE's knowledge of foreign policy may perhaps not be great, but he is not the first preacher who has converted himself. If he ever takes the trouble to study the questions on which he enlightened his audience and himself, he will learn that the Black Sea Treaty and the *Alabama* claims are not associated with glorious recollections.

Plagiarism of style and opinions is pardonable and inevitable in a literary or oratorical novice, and the only interest which for the present attaches to Mr. HERBERT GLADSTONE's speeches is suggested by the model from which, to the best of his ability, he copies. The inaccuracy of most of the propositions which he affirms, and the constant use of mere commonplace and claptrap, may perhaps be only defects incident to inexperience; but it is unsatisfactory to observe a laxity of moral principle which can scarcely be original. Mr. HERBERT GLADSTONE, after condescending to admit his membership of the Church of England, informed the Leeds Election Committee that, if the country decided against the Establishment, he would go with the country. It is hardly probable that he would make so cynical a declaration on his own authority. Mr. GLADSTONE himself, in more than one of his Midlothian speeches, uttered with respect to the Scotch Establishment an equally unjustifiable disclaimer of responsibility; but he involved the announcement in so many parentheses and in such complex sentences that it might mean anything or nothing; and to a Scotch constituency it was unnecessary to say anything about the Church of England. There is too much reason to fear that his purpose has now been inadvertently blurted out, as domestic secrets have often been disclosed by candid and unsuspicious childhood. Having perhaps not hitherto concerned himself with political ethics, Mr. HERBERT GLADSTONE is evidently unconscious of the profound immorality of the course which he proposes to pursue. His own Parliamentary conduct is not indeed a matter of primary importance except to himself and his friends; but, if the general of the Liberal army affects to remit to the rank and file the conduct of the political campaign and the selection of its objects, his abdication of his proper functions involves grave public danger. One of the most fundamental and, in the opinion of a large portion of the community, the most disastrous, changes which could be made in English institutions would be the abolition of the Established Church. Its enemies are even more active than its friends; but it seems impossible that any Englishman of competent knowledge who regards the public welfare can be so far indifferent to the maintenance or destruction of the Church as to leave his own judgment to be determined by a plurality of votes. A young aspirant to notoriety probably cares much more for his own return to Parliament than for the suppression of churches, or for the transfer of ecclesiastical functions and parochial duties to a less refined and cultivated class. That a statesman of the highest rank should be equally unscrupulous would be a misfortune and a scandal. Lord BEACONSFIELD, who to his opponent's morbid imagination has become a type of unprincipled ambition, has never been guilty of so reckless a repudiation of public duty. Among all his supposed crimes the wickedest and worst of Ministers never invited the mob to instruct him whether he should assert the influence of England in Europe, and combat the aggressions of Russia. His virtuous successor has, it may be feared, no scruple in appealing from his own conscience and judgment to the constituencies which are soon to be further packed in the interest of the party of movement.

Though it would have been scarcely worth while to take notice of the mistakes of a young and inexperienced candidate on his own account, the sound which may be insignificant in itself attracts a kind of curiosity when it is known to be an echo. Mr. HERBERT GLADSTONE probably intended to repeat in a paraphrase of his own the principal arguments and conclusions of the Midlothian speeches. If unfriendly critics have misrepre-

sented the spirit and tenor of the agitation, full reliance may be placed on a sympathetic and perhaps an inspired commentary, though in some instances the copyist has involuntarily degenerated into caricature. No controversial orator is more habitually exempt than Mr. GLADSTONE from the weakness of giving undue credit to his opponents; but he would scarcely have assured the meeting at Leeds that two of the most respectable members of the late Government had made statements of which they are utterly incapable. According to Mr. HERBERT GLADSTONE, "the "climax of absurdity was reached when men whom one "would expect to have some common sense—namely, Sir "R. A. CROSS and Sir STAFFORD NORTHCOTE—declared "that the Liberals were responsible for 'the depres-"sion in trade and commerce, because they had unduly "fostered commerce, and had made the revenue "'advance by leaps and bounds.'" That Conservative Ministers should gratuitously attribute to their rivals the prosperity of which the Liberals naturally boasted would have been incredible to a more practised politician. There was more excuse for a vague and utterly unfounded impression, derived from much factious rhetoric, that "the "Irish were right in protesting against unequal laws in "regard to the franchise, the land, and all the rest." There is indeed a trifling difference in the borough franchise of the two countries; but the only inequality of the law of land in Ireland as compared with England has consisted in the transfer to the Irish tenant of a large part of the property of the landlord. In the same spirit, and with equal accuracy, Mr. H. GLADSTONE asserted that the Tories, having inherited a large surplus, had handed over to the Liberals a considerable deficit to make up. He has probably not yet learned the technical meaning of surpluses and deficits, which are always prospective. On inquiry he will find that the late Government has left behind, not a deficit, but a surplus. The reproduction, after a long interval, of the scandalous calumnies against the English soldiers in Afghanistan is less excusable. The statement that the inquiries were made to clear the character of the accused may in a certain sense be true; but it was not to clear the character of the soldiers that the accusations were made.

There is but one opinion among unprejudiced politicians as to the impropriety of Mr. GLADSTONE's wanton denunciations of Austria. It is perhaps creditable to the candidate for Leeds that he should not have perceived the error which has been generally reprobated; but it may be hoped that his own contributions to international concord are not supported by higher authority than his own. The son of the PRIME MINISTER ought to have known that in capriciously attacking another great and friendly Power he might possibly be thought to compromise the Government. Another young gentleman ambitious of a seat in Parliament would not have disturbed the equanimity of any statesman by announcing that he very much distrusted the policy of Prince BISMARCK. "He "thought Prince BISMARCK was as necessary to the "German army as the German army to Prince BISMARCK. "They would stand or fall together, and he thought "Germany had set a bad example to Europe, and had "gone further than it need have done in arming itself." Even a Liberal Four Hundred must have wondered whether it was imbibing the ripe wisdom of its nominee, or receiving a disclosure of the policy which is to animate the new Government. The Ministers are not yet responsible for the defiance of Germany as well as of Austria by the most recent recruit of the party; but, if the policy which is good enough for a Leeds Committee should really be adopted, the intelligent portion of the community, if not the majority of ratepayers, will appreciate the superior prudence and patriotism of Lord BEACONSFIELD's Government. Even a parody may retain the main characteristics of a political system which it makes ridiculous.

ENGLAND AND ITALY IN THE EAST.

THERE is no doubt that the result of the English elections has given general satisfaction in Italy. The services which some years ago Mr. GLADSTONE rendered by his writings to the cause of Italian unity and independence have not been forgotten. The indifference or hostility which the Conservative party showed towards Italy during her struggle against foreign rule has been as little forgotten. Nevertheless, the interests—or what are taken to be the interests—of the present are apt to prevail over historical reminiscences of this kind, even among a people like the Italians, who are more governed by sentimental considerations than we ourselves are. If the interests and hopes of Italy were likely, in the opinion of the country, to be favoured by a victory of the Conservative party in England, the past would have been readily set aside. But in Italian eyes the Conservative Government committed two mortal sins. In the first place, it favoured the extension of Austrian influence in the Balkan peninsula; in the second, it asserted, jointly with France, a preponderating influence in Egypt. It would be asking too much of human nature to demand that the old and well-grounded feeling of hostility to Austria should be immediately extinguished in Italy. Nevertheless there does not appear to be much of it left; and all the efforts of the Irredentist fanatics, with the retaliatory polemic of the Austrian press, have failed to galvanize it into vigorous life. The opposition of Italy to Austria is one of interest rather than of sentiment. There is no doubt that the predominance of Austria in the Balkan peninsula would be viewed with extreme dislike by the Italian people, and by any Italian Administration, no matter to what party it might belong. It is true that there are no definite Italian projects which this predominance would thwart; but there are a great many vague desires and supposed advantages which would thereby be frustrated. It is certainly the general opinion of Italians, as reflected in their press, that Austria has already enough, or too much, in the possession of Bosnia and Herzegovina, and that the interests of Italy require that she should set her face against any further extension of Austrian territory in this direction. It is just this extension which the late Government in England was supposed to favour; and hence one ground of Italian sympathy with English Liberals.

But the late Government not only was on the best of terms with Austria and Austria's Northern backer, but contrived also to work harmoniously with France in the East. There is no doubt that public opinion in Italy views the growth of French influence on the southern shores of the Mediterranean with as little good will as it views the progress of Austria towards Salonica. It is true that the services rendered to Italy by France have not passed away from the memory of Italians, though the price exacted for them, and the hindrances placed later on by France in the way of the fulfilment of Italian unity, must cause the value of these services to be heavily discounted. But at present gratitude to France is not by any means a lively sentiment in the Italian mind. Resentment at the subordinate place which Italy has been compelled to take in Egypt, and fear of the extension of French influence in Tunis, are feelings of a much more active kind. The late Government is certainly jointly responsible with that of France for circumscribing the influence of Italy in Egypt. Whether or not it had good reasons for doing so we need not here inquire; but the fact that it did so is another ground why it did not go to the poll with the blessing of Italian public opinion. The fact, moreover, that a good understanding and common action with France in the Mediterranean is of the highest importance to this country was a reason for thinking that the policy of England in this respect would not be altered until the place of Lord BEACONSFIELD was taken by a statesman whose sympathy for Italy is gratefully remembered by Italians, and who is supposed by many to take his sympathies for other countries, rather than the interests of his own, as the rule of his political action.

It remains to be seen whether the hopes excited in Italy by the change of Government in England will in any degree be fulfilled. If these hopes are staked on a literal interpretation of all that the present members of the party in power have said when in Opposition, they are probably doomed to a heavy disappointment. One enthusiastic Italian paper informed its readers that not only was the Ottoman Government to be now put an end to, but Austria was to be immediately destroyed, and the Kingdom of Poland to be re-established. This is an exceptional flight of the Italian imagination; but moderate men in Italy, as elsewhere, look forward to a change in the grouping of the European Powers as a result of the late elections in England. And it is thought by many that this change will be to the advantage of Italy, and may lead to a closer and more harmonious connexion between the policies pursued by the two countries. In an in-

teresting and exceedingly well-written pamphlet recently published at Rome, *La politica estera d'Italia e le elezioni inglesi*, this point is insisted on. Starting from the assumption that the Ottoman Power is on its last legs, and that the time must soon come when its heirs must divide the inheritance among them, the writer proceeds to ask what the future action of Italy should be under these circumstances. Towards the North Italy has no field for her activity. In time there may be a chance that the Italian-speaking districts of Austria, or some of them, may, in case of the general rearrangement of affairs which must follow on the break-up of the Ottoman Empire, fall to the lot of Italy; but the true field on which the forces of the country can fruitfully expand is along the shores of the Mediterranean. It is southwards and eastwards, and not northwards, that the foreign policy of Italy must turn its attention. And here the main interest of Italy is that no other Power should be predominant, rather than that Italy should herself make any great acquisitions. The only point on which the writer insists with regard to this question is, that if any Power is to occupy Tunis, that Power must be Italy. And, in general, he maintains that it is in conformity both with the interests of England and of Italy that these two countries should work together in the Mediterranean, rather than suffer the gradual progress of French influence, which he affirms to be as dangerous to the one as to the other, to go on unchecked. And, as a third party to this new alliance—whether it be formal or understood—he proposes Russia. Russia is, indeed, the only possible third to this combination, since it is aimed directly both at Austria, with Germany behind, and at France.

Such a policy, however, is clearly founded on the supposed sympathy with Italy of the head of the present Administration in England, and not on the actual facts of the European situation. However agreeable it might be to Italian interests, the objections to it from an English point of view are obvious and decisive. In the first place, the good understanding arrived at, after ages of rivalry, between France and England is too precious not only for the two countries themselves, but for the general peace of Europe, to be sacrificed or impaired without absolute necessity. In the second place, the past history of our bargains and understandings with Russia gives us no guarantee whatever that such an arrangement would serve any purpose but that of Russian aggrandizement. Thirdly, it is hard to see what possible good could accrue from it to England except the protection from the problematic danger that France might become too strong in the Mediterranean. But at present there are no signs of any peril in this quarter. On the contrary, the two Powers work together in these regions with mutual confidence and good will. To weaken this confidence and good will in order to avoid chimerical dangers or to secure chimerical advantages is the last thing that a responsible English Ministry could seriously consider. Finally, what confidence could be placed in the stability of any Italian Ministry or of the policy which it might advocate? Within the space of four years we have seen no less than six Administrations in Italy, and within the next four we may see as many or more. What these Administrations have done, or left undone, at home does not concern us here; but they have certainly failed to inspire any confidence abroad. More than that, they have contrived to produce the impression, unfounded though it may be, that the country is prepared for a policy of adventure. And what foreign statesman could enter into serious negotiation with a Government liable at any moment, without any notice or any apparent cause, to be upset and replaced by another, which in a few months or weeks is sure to undergo the same fate? A Government in a state of chronic crisis will postpone, if it is prudent, the pleasures of a foreign policy. Other Governments, if they are prudent, will keep clear of any engagements with it. However this may be, it is desirable to point out that the satisfaction expressed in Italy at the fall of Lord BEACONSFIELD's Cabinet, arises from no abstract love of the True, the Beautiful, and the Good; but from the practical hope that Italy may get more out of his successor.

THE WEST OF ENGLAND BANK.

A QUESTION asked by one of the jury in the course of the trial of the West of England Bank Directors, which ended on Wednesday, showed pretty plainly the estimate which he, and probably his colleagues, were disposed to form of the case for the Crown. What this juryman wanted to know was, who had put the Treasury in motion? If none of the shareholders or creditors of the Bank had complained, it was not likely that the Government would have moved in the matter. It was not contended that the failure of the West of England Bank placed its Directors on the same unenviable moral level as the Directors of the City of Glasgow Bank. Why, therefore, had the Crown applied to them the same stringent measure? The curiosity of the jury was not satisfied, but the fact that it was felt was significant of the result of the trial. It pointed to an opinion that the prosecution was, at bottom, a fishing prosecution; that it was undertaken not so much to bring home an undoubted crime to those who had committed it, as to ascertain by experiment whether a crime had been committed. This is not a sort of prosecution on which juries look kindly, and it is certainly not a sort of prosecution on which the LORD CHIEF JUSTICE of England looks kindly. Throughout the trial it was clear which way his mind leaned, and his charge to the jury makes it almost surprising that they should have thought it necessary to retire even for a quarter of an hour.

Perhaps Sir JOHN HOLKER was not altogether judicious in reading to the jury a passage from the LORD JUSTICE CLERK's charge in the City of Glasgow Bank case. The LORD CHIEF JUSTICE was not likely to allow a jury in his own Court to take the law from any one but himself; and he is not so diffident of his own opinion as to be afraid of going counter to the ruling of a Scotch Court. It may be admitted, however, that Sir JOHN HOLKER found himself in a strait. If he could induce the jury to share the view of the LORD JUSTICE CLERK, he had a chance of getting a verdict. If he had to acquiesce in their sharing the view of the LORD CHIEF JUSTICE, his chance of a verdict was gone. The LORD JUSTICE CLERK had told the Scotch jury that, if the object of the Directors of the City of Glasgow Bank had been to keep the bank afloat until better times should relieve their securities and their debtors, and enable them to pay their way, it would not in the slightest degree relieve them from the criminal charge. If they meant to represent the bank as being in a more prosperous state than it was, and if they meant the shareholders to believe that, then they intended to run the risk of all the results that might follow from that deception. Sir JOHN HOLKER naturally wished to state the case against the West of England Bank Directors in a similar way. The question, he said, was whether they had not, "knowing the circumstances, designed by means of false representations in the balance-sheets to keep the bank afloat until the good times came and until trade revived." Fortunately for the Directors, the indictment said nothing about designing by means of false representations in the balance-sheets to keep the bank afloat until trade revived. The charge on which they were tried was that they had made false statements in the balance-sheet with intent to deceive and defraud the shareholders and to induce other persons to become shareholders. Consequently the LORD CHIEF JUSTICE told the jury that they must be satisfied, before they could find the defendants guilty of these things, that there had been an intentional falsification of the accounts, that this falsification had been done with a fraudulent intention, and that the particular fraudulent intention had been either to defraud present shareholders or to bring in new shareholders.

In short, the indictment and the evidence did not fit one another. The evidence showed that the balance-sheet had at various times given what, read in the light of after events, proved to be a far too sanguine estimate of the bank's position. But it did not show that this estimate had been given with any intent to defraud the shareholders, or even that the Directors themselves were conscious how over-sanguine it was. They had allowed themselves to be led deeper and deeper into the affairs of BOOKER and Co., and of the Aberdare Iron Works, and when at last it was plainly impossible to draw back without heavy loss, they had gone on, hoping that, if they could but tide over the present difficulty, things would right themselves in the end. Had it not been for the extraordinary and continued depression of trade, there is little doubt that things would have righted themselves, and it would have been asking too much from human nature to expect the Directors to proclaim to the world all the doubts that might from time to time suggest themselves as to the ultimate success of the efforts they were making. There is not in the whole case the slightest sus-

picion of anything worse than imprudence in the first instance, and a resolution to put the best face they could upon their affairs after they could no longer disguise from themselves that they had been imprudent. The dilemma they were in was this. Entire frankness would prevent any new shareholders from coming in; but then it would do so at the cost of bringing inevitable ruin upon the existing shareholders. To proclaim that the bank was insolvent was to make it insolvent; to conceal the fact that it was insolvent was to give it a chance—the Directors may honestly have thought a fair chance—of becoming solvent once more. That is a very difficult choice for a body of men to have to make, and we dare say the more common opinion—we certainly do not say the better opinion—will be that, under the circumstances, they decided rightly. The Lord Chief Justice evidently thinks so. "I confess," he says, "that "I cannot see how it would have been for the advantage "of the shareholders that these circumstances should have "been made known to them, assuming that the circum-"stances were such as really to destroy the value of their "shares." He admits, it is true, that there is another side to the question, and that the concealment which, from the point of view of the actual shareholder, was beneficial, from the point of view of the intending shareholder was mischievous. There is nothing, however, to show that this aspect of the case was present to the minds of the Directors in any special way. They were not anxious to attract new shareholders; and, even if the statements in the balance-sheet had been knowingly false, they would not have been made with the intent to induce any person to become a shareholder in the bank. As, therefore, they were certainly not made with a view of defrauding the existing shareholders, neither of the offences contemplated by the statute has been committed.

Although, however, the verdict is sufficiently intelligible under the circumstances, the state of the law cannot be called satisfactory. Banking is supposed to be a particularly safe business. Unsafe banking, as Mr. Bagehot has said, is bad banking. But the business of the West of England Bank was particularly unsafe, and by consequence it was eminently bad banking. Even the Lord Chief Justice admits that "the tying up of the funds "of the bank to the extent of two-thirds of its entire sub-"scribed capital in mining speculations .... was not consis-"tent with sound principles of banking." Now investors who suppose themselves to be placing capital in an unusually safe and steady business have a right to be protected against a perversion of that capital to a wholly different purpose. It cannot be supposed that, if the shareholders of the West of England Bank had foreseen the kind of business the bank would do, they would have trusted the Directors with their money. If they had wanted to embark in mining speculations, they could have done so directly, without invoking the aid of a company of bank directors. Were the accounts of the West of England Bank kept in such a way as to enable the shareholders to appreciate the character of the enterprises upon which the Directors had embarked? If they were, the shareholders had, of course, no one to blame but themselves. If they were not, then there is undoubtedly a need that the law should insist on similar accounts being so kept for the future. No legislation can secure people against the consequences of their own carelessness or folly. If bank shareholders like to leave their Directors free to do exactly what they like with the bank capital, Parliament cannot, and need not desire to, protect them. But it can and ought to secure that bank shareholders shall have the means of knowing the nature of the business which their Directors are doing, and that, if these means are withheld, the Directors shall be criminally liable for keeping them back.

LAND LEGISLATION.

The Chamber of Agriculture lately approved Lord Cairns's Land Bills by a unanimous vote. The object of the principal measure is to enlarge the powers of life tenants for the main purpose of facilitating the improvement of their estates, with the probable further result of throwing more land into the market. A tenant for life who wishes to drain or build will, under certain restrictions, be allowed to sell a portion of the property that he may apply the purchase-money in the improvement of the rest. The benefit which may consequently accrue to the remainder-man will therefore be acquired at his own expense, instead of diverting funds to which younger children or other relatives of the limited owner might be morally entitled. The purchaser of land under settlement will be able to obtain a good title if his advisers ascertain that all the statutory conditions of sale have been satisfied. Many Acts have already been passed for the promotion of similar objects, and some of them have not been inoperative; but the power of charging the land with the cost of improvements is hampered by many restrictions; and in some instances it is necessary to contract with certain privileged joint-stock Companies, which of course require a profit to themselves on the transaction. Lord Carington, who seems to have been the principal speaker at the meeting, professedly represented the interests of life tenants, who would willingly approximate as closely as possible to the condition of owners of fee. Tenant-farmers who have lately promoted agitation on the subject generally think that their interest lies in the same direction. It is not surprising that Lord Wentworth, who describes himself as a remainder-man, should, in a clever article in the *Fortnightly Review*, take a different view of the expediency of Lord Cairns's legislative project as far as it is retrospective. He remarks with some force that the House of Lords, which generally accepted Lord Cairns's statement as satisfactory, consists, with few exceptions, of tenants for life. Remainder-men who might have something to say on the other side are only expectant peers. In many cases, perhaps in most cases, there is no real conflict of interests, inasmuch as it will be for the benefit of the future owner to find the estate at his succession in the best possible order. It is true that every relaxation allowed to the life tenant must derogate from the strict rights of the remainder-man. The best apology for interference with vested interests is that the effect of merely prospective legislation would be remote and slow. In the majority of instances remainder-men are the sons of the present owners, whom they may probably regard with a certain amount of good will.

Although Lord Wentworth objects to retrospective enlargement of the powers of life tenants, he is prepared to concur in the prohibition of future settlements of land. Every possessor ought, in his judgment, to be absolute owner, with power to sell and to dispose of the property by will. It is not wonderful that Lord Cairns contented himself with a less heroic measure. The almost uniform practice of owners either of land or of personalty must be regarded as an indication of the general opinion. Few persons who can provide their daughters with a competent dowry allow them to marry without a settlement, which for the most part includes a provision for unborn children. Exceptional restrictions on the power of dealing with land may possibly be expedient, but they would at present be distasteful to owners. In the common case of a settlement or will giving an estate to sons and daughters in succession, the compulsory exhaustion of the power of disposal by an absolute gift to the eldest son would be felt as a grievous hardship; yet a provision that the estate should devolve on the next son, on failure of the original heir and his issue, would involve the creation of one or more life estates. In matters of this kind legislation ought to be moderate and tentative.

The Farmers' Alliance, which, in contrast with the Chamber of Agriculture, assumes an adverse or hostile position to landlords, claims to regulate or control in the interest of tenants the disposal of the property of owners. The pretension is comparatively novel, and until lately it would have been dismissed as anomalous. The occupying farmer holds the land by voluntary contract, with the power of enforcing covenants in his own favour; and it is now contended that he is entitled, for his own further benefit, to alter the *status* of the other party to the bargain. The landlord may be compelled to execute any improvements for which provision has been made in the lease or the agreement; and recent theorists insist that he should be placed in the most favourable position, not only for discharging his express obligations, but for investing additional capital in the land. Even if large powers of entail and settlement were admitted to be beneficial to landowners, the new school of economic projectors would still urge their demand on behalf of tenant-farmers, and perhaps of possible purchasers. The political and social objections to the accumulation and continuance of overgrown landed estates are more weighty than the arguments by which tenant-farmers and their advocates

seek to justify their interference with the tenure of land. Even if an owner in fee were necessarily richer than a life tenant, he could scarcely be compelled to employ his capital in improvements. In many instances, as Lord SALISBURY once pointed out, the absolute owner would mortgage his estate, with the result of crippling his power of improvement. One of the numerous writers who have devised schemes for depriving owners of discretion in the management of their property proposes to guard against the creation of incumbrances by making mortgages illegal. The mediæval passion for superseding the independent conduct of every man's affairs by officious legislation is reviving in matters relating to land.

A late controversy between the official representatives of the Farmers' Alliance and an Irish member who professed to have been the founder of their Association suggested some inferences of a wider scope than the dispute on an uninteresting fact. Mr. O'DONNELL, who is a follower of Mr. PARNELL, perhaps understood better than his temporary English associates the logical consequences which might be deduced from the acknowledgment of a right vested in one class to regulate for its own purposes the property of another. Wealthy manufacturers who conduct an agitation for interference with the discretion of landlords may be well assured that they are liable to become victims in their turn. In countries where land is more largely subdivided than in England, Socialist declaimers habitually denounce capitalists instead of landlords. Equal distribution of the materials of industry is in Paris and Berlin a more popular formula than the prohibition of private ownership in land. It is true that the respectable members of the Farmers' Alliance neither talk nor think of the rude process of confiscation; but some of them will do well to consider the language of Irish demagogues, and to remember that attempts were made to connect their body with the Land League which now proposes open and unmitigated robbery. At a late meeting attended by Mr. PARNELL, who is recognized by a section of Irish members as their political leader, one of the principal speakers informed the sympathizing audience that land, air, and water were the property of no man, but of the collective human race. That land would not be carefully cultivated by any occupier or workman for the benefit of the human race was a detail unworthy of the attention of the orator. Mr. PARNELL and his followers have repeatedly advised tenants to break their contracts with their landlords by withholding their rent; and some of the agitators lately boasted that, by compliance with this advice, the occupiers had saved a million sterling. A Socialist speaker in the German Parliament asserted a few days ago that his party was identified in principle and in organization with the Nihilists of Russia and with the French Commune. He would not object to admit as worthy members of the alliance the Irish brawlers who directly assail the foundation of private property. By a strange anomaly, a not inconsiderable section of the Irish priesthood have joined the conspiracy, although Continental Socialists proclaim themselves the irreconcilable enemies of the Catholic Church.

Large farmers are in a false position when they combine against the actual distribution of land, and for the restraint of freedom of contract. The Secretary of the Farmers' Alliance, in a lately published article, includes among the demands of the Association the inalienable transfer to the occupying tenant of the right to ground game. If such an enactment were passed, a farmer would be prohibited from demising the right of shooting, although he might have obtained it by agreement from his landlord. At the present moment, when landlords in many parts of England know to their cost the difficulty of keeping or finding tenants, it seems wholly unnecessary to interfere with the freedom of both parties by imposing arbitrary legal restrictions. The claim of farmers to alter the usual tenure of land for their own benefit is both paradoxical and short-sighted. Whatever may be the effect on the general community of the system of large estates, it is a condition of the existence of capitalist farmers. Few of them could without heavy pecuniary sacrifice own the land which they cultivate; and freehold farms would, in the majority of cases, be necessarily sold or divided on the death of the owners. In Ireland, graziers, though they of course occupy pasture land to the best advantage, are more obnoxious to the malcontent peasantry than the landlords, because they are supposed to hold more than their share of the soil. Perhaps the best excuse for the present activity of the Farmers' Alliance is that the farmers for the moment exercise a political power which is about to pass from their hands. Mr. [illegible], indeed, assures them that the enfranchised labourers will at first support their demands against the landlords, but he is not at pains to conceal his suspicion that their next attack will be made on their immediate employers. Rural agitation may not assume the same form in England as in Ireland, but it is inevitable and will be dangerous.

THE INTERNATIONAL.

A NAME that was once a name of terror to Europe has died out, and the International, which inspired so much curiosity and then so much vague apprehension, has become not only extinct, but forgotten. But Socialism has still so strong a hold on the Continent that every phase of its history is worth studying, and M. DE LAVELEYE has performed a public service in gathering into a masterly summary the scattered facts which make up the record of this once famous society. The International rose into something like greatness and sank into utter decay, and the causes of its rise and fall are too intimately connected with what is going on and has been going on around us to permit us to remain indifferent to its story. Told in a few words, its story is that of a society which lived while it aimed at that which was possible, and died when it aimed at that which was impossible. It flourished as the centre of a gigantic Trades' Union, and withered as the nucleus of militant Socialism. It is in its decay that it is most interesting, for militant Socialism is something so vague and intangible that anything is welcome that helps us even in a slight degree to understand it. The latest and most advanced form of militant Socialism is Nihilism, and nothing is more difficult to ordinary Englishmen than to comprehend how any set of men can go on year after year spending their strength and risking their lives in order to get to nothing. In a general way it is intelligible that from the depths of human folly there should rise a desire to make a clean sweep, to have done with everything, to have no religion, no country, no State, and no family. But experience amply proves that such a stage of thought is never reached without the mind having gone through previous transitions, and that one thing after another must have been rejected before the imagination can be fascinated by a blank. The distance from Trade-Unionism to Nihilism is a long one, and the history of the International fortunately supplies us with materials for a knowledge of how this distance may be covered. In England there is nothing like militant Socialism, and we are thus happily cut off from any personal acquaintance with what is to the Continent a cause of permanent and sometimes vivid apprehension. But Trade-Unionism is not only familiar to us, but is an English invention; and in examining the history of the International we have thus the advantage of starting with what is known to us, and only gradually passing to that which is unknown. We begin with England and end with Russia. It was an English Exhibition that started the International, and a speculative Russian that ruined it. But before BAKOUNINE interfered to mar its fortunes, ideas had germinated in its breast which paved the way for his interference. The International was never a conspiracy; it was a public, not a secret, society; its central authority had the slightest possible sway over its members, and it fell to pieces when men who came to talk found they were talking of different things. Its history is like the history of a school of philosophy, and not like the history of the Carbonari, of the followers of MAZZINI, or of any of the sects which have aimed at revolution through plots and violence. It had no funds or machinery, and scarcely any definite objects. It thought and talked till it talked itself out, and such interest as attaches to it is the interest of following a peculiar vein of thinking and talking until the vein disappears.

In 1862 the idea was started, and was immediately caught up and patronized by the Emperor NAPOLEON III., of sending a delegation of French workmen to the London Exhibition. A cordial welcome was given by the English workmen to their French brethren, and a sort of feast of international fraternization was held at the Freemasons' Tavern. There the questions that were agitating the minds of those who were assembled were discussed without precision, but also without warmth. The fraternising workmen were

[illegible] of what was to become of them. How, in the days of unlimited competition and of machinery growing more and more perfect, were they to get enough to live on? What, in fact, were they living on in this and that part of the world? Information seemed to be that which they most wanted, and the notion was thrown out that it would be eminently desirable to have a Committee which should receive from different quarters any correspondence that could illustrate the actual state and struggles of the working classes. It may be remarked in passing that this is precisely the object which Mr. BRASSEY has set before Trades' Unions as the only fruitful and legitimate object for which they can strive. The beginning of the International was the goal of Mr. BRASSEY. But the International was not destined, and was not at all likely, to be satisfied at its outset with the modest aim which Mr. BRASSEY preaches after years of study and observation. It was not until two years afterwards that anything was done to give a practical shape to the aspirations which had manifested themselves at the date of the Exhibition. In September 1864 a meeting of workmen of all nations was held in London, and of this meeting M. KARL MARX was the quickening spirit, an agent of MAZZINI only attending to withdraw when it was found that nothing like an organized and secret society was in contemplation. What was founded was a kind of harmless society for the study of social questions, with a General Council that did not pretend to be more than a centre of information, and with so humble a conception of its functions that a subscription of 3*l.* was considered sufficient to defray its probable expenses. The Society was to move entirely in the path of the political economy of Mr. MILL. The maxim of the workman was to be "self-help," and workmen were to help themselves by forming associations which would give them profits instead of wages. The progress of the Society was at first slow, and it was only in 1866 that sixty delegates met at a General Congress in Geneva. The Congress, in the main, adhered to the programme of merely collecting information; but it showed that the Society was already willing to entertain some of the questions which began to command attention when it was asked, not only what was the position of the working classes, but how that position might be improved. Resolutions were passed in favour of the limitation of the hours of work, of compulsory education, of direct taxation, and of the suppression of standing armies. The next year was the year of the Paris Exhibition, and it was then that the International assumed real importance. It began to interfere actively between the employers and the employed. It terminated a French strike by inspiring the masters with an idea that their workmen were so powerfully aided that their resistance could not be overcome, and it prolonged an English strike by preventing foreign competitors from replacing English workmen. Before long so much had been done that, at a Congress held at Lausanne, the Council-General was able to announce that 60,000*l.* had been spent in the encouragement of strikes. New ideas began to make their appearance, and it was resolved not only that railways should be taken over by the State, but that Co-operative Societies should be discountenanced as tending to make some workmen better off than others, and that a political was entirely inseparable from a social revolution. This last resolution was a complete departure from the ideas of KARL MARX, and was warmly but vainly resisted by him. Its adoption contained the germ of the dissolution of the Society, as it changed the character of the association, and embarked it on the dangerous career of pronounced opposition to the existing order of things.

But the International, so long as it retained any degree of cohesion, never mixed itself up with political revolutions. When the war of 1870 seemed imminent the International contented itself with protesting against any war anywhere, on the ground that all wars are inimical to the well-being of the poor; and although members of the International took part in the insurrection of the Commune, the Society as a body had nothing to do with it. The International remained a speculative society, and its mode of taking part in the political revolution was only to admit speculations which assumed as their basis that a complete change in political arrangements was at once desirable and possible. What M. DE LAVELEYE terms the doctrine of Collectivism forced its way to the front. This was something different from Communism as Communism is commonly understood. By Collectivism is meant that everything is to be done and managed by a society. Railways, mines, forests, and even the soil, are to be worked by associations. Every industry is to be in the hands of some association, and every workman is to find in his association the means not only of subsistence, but of wealth. What is remarkable in this impracticable conception is that it gets rid of the idea of the State. The associations include every one, but there is nothing above the associations. And not only is there no State in the sense of a governing machinery, but there is no State in the sense of a country. A workman belongs to his association, but to nothing else, and his association is supposed to be equally perfect and equally self-sufficing, whether its geographical home is situated in France or in China. This conception, it is needless to say, is in entire opposition to the Socialist view of the State as the centre and mainspring of all human life. The State has to fade away at the dawning of the association, and thus the conception of Collectivism gave an easy opening for the intervention of BAKOUNINE in the affairs of the International. In a Congress held at Basle he pressed the conclusion that those who wished the end wished the means, and that those who desired the disappearance of the State must also desire the disappearance of the institutions on which the State is based, and with which, he had the sense to see, it is indissolubly connected. Religion, law, the family, and hereditary succession are not so much props as essential elements of modern civilized society; they must all perish with the State if the association is to be all in all. What makes this conception, and Nihilism, which is only an extreme mode of stating it, peculiarly Russian, is that it is evidently nothing but a reproduction or a glorification of the Russian communal system. If there were no Czar, no tribunals, no police, no Church, and no succession derived from marriage, the communes might be supposed to have a clear field for showing what they could do. To the argument that under a reign of anarchy the communes could not cohere, the Nihilists, so far as they are capable of argument, may be taken to reply that the communes would cohere if all the causes that can be supposed to prevent their cohesion ceased to exist. The views of BAKOUNINE found little favour with the orthodox members of the International, and he founded a secret society, nominally in alliance with, but really in opposition to, the parent association. For this breach of discipline he was expelled from the International; but a schism arose, and a considerable section proclaimed that it still considered him a member. A fierce contest arose, and the International was broken into two divisions, the orthodox section reverting to the original programme of Trade-Unionism, and the revolutionary section losing itself in the general current of Continental Socialism. The seat of the General Council was removed to New York, in order to superintend American strikes; but, directly the International lost the prestige of its European connexion, it ceased to have any vitality, and the Trade-Unions of England and the States thought that they could manage their own strikes for themselves, without any artificial aid or patronage. With its collapse the dissidents collapsed too, for it is impossible to go on dissenting from a body which has come to an end. Collectivism was merged in Nihilism, and this was inevitable, for Nihilism is Collectivism active and rampant; and, if anarchy is to be preached, it must be preached in action, for men can only acquiesce in aiming at nothing by doing something. The plots, the murders, and the arson of the Nihilists are not so much the consequences of their speculative theory as the condition of this theory being entertained. Nihilism will wither away, like its predecessor the International, when it ceases to blow up palaces and to assassinate officials. The International got to the end of peaceful speculation, and it is reserved for Nihilism to get to the end of sanguinary and revolutionary action.

WOMEN'S SUFFRAGE.

THERE has been a great stir among the strong-minded this week. Whether anything specially feminine has been recognized in the composition and leading of the new Ministry; whether the remarkable success of mere clamour in the late elections has encouraged persons naturally inclined to that method of argument; or whether

the movement is merely dictated by a not unnatural hope that the new broom may, in the vigour of its newness, sweep into the most unlikely of corners, we cannot say. But a series of meetings has been going on in different parts of London during the past week, which culminated in a grand gathering at St. James's Hall on Thursday night. The earlier and less central meetings had not been destitute of liveliness. On this day week, in odorous Bermondsey, Mrs. MACLAREN, with engagingly feminine logic, announced that these gatherings were efforts on the part of the feminine sex for what was only their right. No one present, evidently, was heartless enough to point out to the speaker that, in the first place, political students are far from being agreed upon the question whether the franchise is a right at all, and that, even granting this, the question whether it is a right of lovely woman is exactly the point at issue. Mrs. MACLAREN, true to the politics of her family, appears to have made some references to the late election which, considering that women's suffrage has not yet been made a party question, were scarcely wise, nor, though the considerate reporters altered her phrase into one much more relevant, would this uncompromising Radical accept the alteration. This gathering of the masses seems to have been followed by a drawing-room meeting at which Mr. STANSFELD—not, alas! in the character of a Cabinet Minister, which some hasty sympathizers assigned to him at the beginning of last week—preached caution mingled with hope. Mr. STANSFELD is of opinion that "members of Parliament "must eventually be logical," which is perhaps the most daring avowal of millenarianism that has ever been made. Mile End then followed Bermondsey by assembling in its hundreds, and the meeting in that remote locality appears to have taken with commendable calmness the proposal of a base opportunist that "widows and spinsters" should have the franchise. The Rev. Mr. HADDEN, of St. George's in the East, may or may not have been speaking sarcastically when he said that, "according to "his experience, the women of the East End were quite "as well fitted to exercise the suffrage as their husbands "and brothers." But the most interesting illustration of the danger of too highflying argument was supplied by Miss HELEN TAYLOR, who urges that, "If it was said "that men were intellectually superior to women, "the same argument had, *with abundant foundation of "reason*, been urged against the extension of the franchise "from the upper and middle to the lower classes." In other words, because we have made one mistake, Miss HELEN TAYLOR would like us to make two. The catena of argument was worthily closed, as far as the preliminary meetings went, by a speech of Mrs. LUCAS at Islington on Wednesday. This lady is of opinion that "at present half the "brains of the country are allowed to lay"—we hope she said lie—"fallow, without doing the full work that GOD "intended them to do." It is indeed rash to contend with opponents who are furnished in this manner with particular and otherwise unrevealed information as to the intentions of the ALMIGHTY.

These displays were, however, only preliminary canters to the meeting on Thursday, which seems, to do it justice, to have been really a considerable gathering. The baser sex were only admitted on payment, and even after this Miss HELEN TAYLOR sternly declined to recognize their presence, and addressed the assembly pointedly as "ladies." It is said that "pleasure was caused by the announcement "that an overflow meeting would be held," and it is easy to conceive the satisfaction of the fair at having overflow meetings and everything handsome about them even as though they had been perfidious and tyrannical man. On the platform it would seem that many heroines gathered, some of them veteranesses in this war and others recruits to the cause. The quality of the eloquence, however, was neither better nor worse than usual. The approaching enfranchisement of the agricultural labourer was duly improved, though the speakers do not seem to have taken note of the fact that, after coming in on purpose to enfranchise him, his champions have discovered (if we may trust their chief organs) that it would be highly indecent to do it for five or six years yet. Besides this argument from analogy—if you give the suffrage to one unfit person, why not give it to two?—the old appeals to taxation, to the actual exercise by women of the municipal and educational franchise and so forth, were repeated. The meeting, however, showed as usual a decided tendency to dwell rather on the general wrongs of women, which the suffrage is supposed to have some magic power to remedy offhand. We are afraid that Lady HARBERTON, who imagines that there is some special delight in voting, would find it a comparatively tame joy if she were to try it. Mrs. SCATCHERD has discovered that, even in education, there are two laws, one for men and another—a worse one—for women. Mrs. ARTHUR ARNOLD, pursuing the same line of exploration, has found that women have fewer civil rights than the lowest specimen of male humanity. Miss TOD thought it would be an excellent thing to bring into public life "that high tone" which distinguishes women. To bring a high tone into public life means, we suppose, to shriek, and really a large portion of the male inhabitants of this country have developed such an excellent faculty that way of late, that we hardly think they need reinforcement. Finally Miss BECKER took occasion to expose the lamentable ignorance of the present IRISH SECRETARY, and Mrs. WEBSTER settled the whole matter by observing that "whether women had grievances or not, "they were entitled to votes." *Qui qu'en grogne, ainsi sera; c'est mon bon plaisir.* The motto which ANNE of Bretagne inscribed on the Tower of St. Malo would evidently suit Mrs. WEBSTER perfectly.

We are not prepared to say what chance these ladies have of obtaining satisfaction at the hands of the Government of distinguished men which Mr. MUNDELLA (including himself with commendable modesty) tells the inhabitants of Sheffield has succeeded to power with the intention of doing no Conservative work, and of not being muzzled. A Government of such gifts and graces might do anything. The worst of it is that it is not possible, with due regard to the conventions of society, to argue the women's rights matter out loud. There once was, if we remember rightly, an adventurous member of Parliament who did speak out on the subject, and shocked everybody dreadfully. It is sufficient to say that when Lady HARBERTON talks about the laws denying women the care of their own children, she naturally suggests the question whether the laws do not at the same time relieve women of the burden of supporting their own children. The majority of the arguments which were advanced at St. James's Hall lead to a conclusion by which as it seems to us, the male sex is not the sex that has most to lose. This is doubtless what Lady HARBERTON's interlocutor meant when, in a polite circumlocution, he told her that "women must be prepared to take the rough with the "smooth." If the whole of British womankind, in due caucus assembled and represented, decide that free quarters for life, deference and respect in the vast majority of cases complete control of the household in most, and of a good deal more than the household in a great many, are things not worth having in comparison with liberty and a vote why there is nothing to be said to their decision. The world will probably be very unpleasant for them, and not too comfortable for old-fashioned and easy-going people of the other sex. But it is certainly not the other sex that will have the worst of it. It is, however, perhaps useless to put this view of the matter, because it is quite certain that the speakers of Thursday night would sternly refuse to listen to it. Their demand is the old and amiable demand, to eat their cake and have it. They are to have the care of their children, but not to be burdened with the support of them; to be maintained by men, but not to be subject to them; to retain the position assigned to them by the courtesy of society, without submitting to the theoretical inferiority and helplessness for which that position is the unwritten equivalent. That many or most of them realize the unpleasant impossibility of consuming the feast and avoiding the reckoning we do not suppose. It is not the habit of the feminine mind to take in numerous ideas at the same time or to follow out trains of reasoning at any length. It is much easier and more congenial to say, "You are going to enfranchise the "agricultural labourer, why don't you enfranchise me?" or to talk about the law refusing women the care of their children, or to imagine mysterious cases of fancied wrong, such as that which has brought down upon poor Mr. FORSTER the pity, rather than the anger, of Miss LYDIA BECKER. Of course the half-way people, as they may be called, the people who feebly suggest widows and spinsters as suitable persons to represent the female sex in the constituencies, escape some of these awkwardnesses; but only some of them; while they, like all half-way people, satisfy nobody. If the women's suffrage movement has any meaning at all, it is as being part of a larger movement for the assertion of

complete legal, social, and political equality for both sexes. The certain result of the improbable success of such a movement has already been pointed out. It is a great pity that the ladies who propagate these absurdities among their poorer and less educated sisters do not open their eyes to the real condition of things to which their action tends, or would tend if it could succeed.

CIVIL MARRIAGE.

THE Roman Catholic Church enjoys in modern Europe a great and unapproachable advantage. She can dress her ministers in magnificent clothing without making them ridiculous. There was a time when she shared this advantage with the State, and in Oriental countries she does so to this day. In the middle ages kings and nobles could make themselves as fine as priests and cardinals, and no one saw anything to laugh at in the spectacle; and in the East gorgeous robes are still the natural clothing of every one in authority. But for lay and civilian Europeans dress in this sense is a lost art. The strange panoply of gold lace in which a Minister appears at an official reception excites wonder and nothing more. There is no admixture of either admiration or reverence. Even when a European is surrounded by Asiatics, he is well advised if he makes no attempt to rival them. The first thing that occurs to the visitor to the Royal Academy as he stands before Mr. PRINSEP's vast canvas is curiosity as to what the Indian princes who assisted at the proclamation of the Empress of INDIA could have thought of the extraordinary figure which occupies the principal place in the picture. Was Lord LYTTON a Viceroy or a magnified blue jay? In his invaluable notes on Rural Life in France, Mr. HAMERTON has pointed out the immense superiority as regards externals of ecclesiastical over civil ceremonies. "Modern "life," he says, "is miserably deficient in external pomp "and solemnity, even on those occasions when people feel "that visible ceremony is necessary. The Church of Rome "supplies this want, and supplies it with all the skill "derived from centuries of traditional experience." Now marriage is an occasion upon which a great many people feel that visible ceremony is necessary, and marriage is also one of the occasions upon which a considerable number of Frenchmen think it essential to have nothing to do with the Church. The all-sufficiency of civil marriage is as much an article of the Radical creed as the all-sufficiency of civil burial. No doubt there are times when lovers who belong to the advanced Left are sorely tried in this respect. Things may not go as far as they do in M. SARDOU's comedy, but the relations between the intending husband and the intending wife must occasionally be a little strained by the refusal of the former to be married in church. If anything could be done to invest the civil ceremony with a little dignity, the bride might be more easily reconciled to the omission necessitated by the bridegroom's political principles.

The PREFECT of the SEINE seems to have been lately led into a line of thought closely resembling Mr. HAMERTON's. It is needless to add, however, that the practical conclusion at which he arrives is different. He may perhaps have read *Round My House*, and have laid to heart the remark that, "if an anti-clerical Government "wished to weaken sacerdotalism effectually, its best "means of doing so would be to establish imposing civil "ceremonies for the great occasions of private and public "life." It is true that the PREFECT's English counsellor adds that to this "there is the insuperable objection that no "modern authority could invent such ceremonies without "making them and itself ridiculous." But M. HÉROLD is too true a Frenchman and too good a Radical to admit the possibility of an anti-clerical Government ever becoming ridiculous. The deeds of reactionary Administrations are excellent themes for laughter, but appreciative awe is the only emotion which a Radical authority can possibly evoke. Accordingly, he has issued a circular letter to the Mayors in his department impressing upon them the importance of assuming "a certain solemnity of attitude and "costume in the celebration of marriages." He has indeed another object, as will be immediately seen, but in the first instance it is the clothing of the Mayors that he has in mind. It is to be wished that M. HÉROLD had gone a little more into detail upon a matter which he justly thinks especially important "at an epoch when some superficial "spirits are trying to make fun of a ceremony so grand "in its simplicity." It would have been interesting to know what is the attitude and what the costume which the PREFECT of the SEINE thinks best calculated to have the effect he desires. Respect for the municipal scarf, he says, exists in France, as it is natural it should when we remember that this scarf is "a creation of 1792." There is reason to think, however, that M. HÉROLD is not so confident upon this point as he professes to be. If the municipal scarf is already universally respected, why should it be necessary to supplement this article of dress by any other? We mean of course by any other official garment. The probable explanation is that M. HÉROLD's observation of civil marriages has convinced him that a scarf tied round the waist is not in itself solemn, and that so long as the Mayor has only this decoration to trust to, it will be of very little use for him to attempt to make up by solemnity of attitude for what he wants in solemnity of dress. M. HÉROLD's next step no doubt will be to suggest a complete municipal costume—something, perhaps, between an alderman's gown and a cope, with a device representing the Republic embroidered in three colours on the back; and when this has been done, he may justly feel that he has not held office in vain.

Even then, however, there will be a fly in his ointment, in the shape of a certain Mlle. HUBERTINE AUCLERC. This lady holds advanced, not to say revolutionary, views upon the relative duties of husbands and wives as defined by the Civil Code, and she has lately taken advantage of the ceremony of a civil marriage to impress her opinions upon the newly-wedded couple and their friends. M. HÉROLD is very much exercised about this oratorical addition to the marriage rite. He is afraid that respect for civil marriage will be lessened if "the legislation which conse-"crates it" is publicly criticized the moment after the marriage has been celebrated. In this case the Mayor had but just ceased reading certain articles of the Code when Mlle. AUCLERC jumped up and denounced them. We know enough of ladies of Mlle. AUCLERC's type in England to feel sure that she did not mince matters. She does not seem even to have confined herself to the iniquities of the marriage relation; at least, M. HÉROLD's assurances that on any other occasion than that of a civil marriage she is free to demand admission to the list of voters, and to claim the right of taking her turn in the army, point to a more general treatment of the inequalities between the sexes. Unfortunately the enemies of civil marriage have got hold of this incident, and have not confined their jokes to Mlle. HUBERTINE AUCLERC. The result is that the respect for civil marriage which M. HÉROLD is so anxious to inculcate by costume and attitude is in danger of being lessened by speech. Of what avail will it be to rig out the Mayor in a municipal vestment of M. HÉROLD's devising, and to instruct him how to stand and move so as best to bring out the solemnizing influences of his new clothes, if the whole effect is to be destroyed by an inconsiderate attack on the law to administer which he has just dressed and posed himself?

Happily the law provides a remedy even for this unforeseen inconvenience. It is a mistake to suppose that every one has a right to speak at a civil marriage. There is such a thing as brawling out of church, and Mlle. AUCLERC has come very near to being guilty of it. By the terms of the Code the Mayor and the bride and bridegroom are the only persons qualified to break the severe silence of the municipal ceremonial. The Mayor may indeed, in his character of police constable, allow some friend of the newly-married pair to say a few words, and this liberty, if used with moderation, tends, M. HÉROLD thinks, to increase the simple grandeur of the proceedings. But there is no place for Mlle. HUBERTINE AUCLERC. No one must speak unless bidden to do so by the Mayor, and the Mayor must be careful to choose speakers who will confine themselves strictly to the commonplaces contemplated by the Code. If any speakers present themselves without waiting to be invited, the Mayor is to dissolve the meeting and have the room cleared. M. HÉROLD hopes, however, that no good Radical will ever be guilty of acts of defiance persistently enough to call for this strong measure. So long as the Mayor is present the PREFECT assumes that the company will behave themselves. The only way, therefore, for the Mayor to ensure obedience to the law is not to leave the wedding party until they are safe out of the room. In the case which has called for the PREFECT's intervention, the

Mayor had left before Mlle. Augléro rose to her feet. In future this unfortunate official must stay until the last word has been said, and the last compliment paid. If civil marriages are numerous, they may be expected to have much the same effect on a Mayor's brain that repeated funerals are said to have upon the chaplains of popular cemeteries.

EDUCATIONAL CONTROVERSIES.

THE columns of the *Times* have this week been the theatre of two educational controversies, each of which deserves to be watched with some care. The general policy of the Education Code is threatened from one quarter, and the alterations introduced into it during the present year are attacked from another. The London School Board has petitioned the Education Department against an alteration in the limits of age within which attendance may be reckoned for children in elementary schools, and against the proposed exclusion of children in the Fourth Standard from the grant for extra subjects. Lord Norton proposes to call the attention of the House of Lords to the extent to which middle-class instruction is now given at public expense in elementary schools, and to move that the Education Code be referred to a Select Committee. This latter question will be more conveniently considered when Lord Norton's motion is nearer at hand; but it may be worth while to point out that there is no necessary antagonism between the terms of the proposed Resolution and the arguments alleged against it by Sir Ughtred Shuttleworth in yesterday's *Times*. Lord Norton has not announced that he will propose to refer the new Education Code to a Select Committee of the House of Lords, nor does he confine his implied censure of the "departure which has now been taken from the "original and still professed scope of national education "in this country" to the Code of 1880. Sir Ughtred Shuttleworth might have seen by a simple comparison of dates that Lord Norton's motion could not be intended as an attack upon the Code of 1880 in particular. That Code, as Sir Ughtred Shuttleworth himself states, "was pub- "lished during the turmoil of the election." The notice of Lord Norton's motion was given, as he himself says, "some time before the dissolution." Sir Ughtred Shuttleworth must have a high opinion of Lord Norton's prophetic powers if he credits him with proposing, some time before the dissolution, to condemn a document which was only published during the turmoil of the elections. The object of Lord Norton's Resolution, as we read it, is not criticism of this or that clause in the Education Code, or of the Code for this or that particular year. It is rather to draw the attention of Parliament to a change which has insensibly been going on for many years, which may in itself be a good or a bad change, but which, whether good or bad, has never yet been properly considered. So far are the particular changes introduced into the Code for 1880 from being specially aimed at by Lord Norton's motion that we should even imagine he would regard them as improvements. It is the whole policy of the "Fourth "Schedule" that he wishes to bring under discussion. Sir Ughtred Shuttleworth objects to this as the raising of "a "time-honoured scare," and strongly deprecates the reference of the Code to a Select Committee of either House at a moment when it must come under the consideration of a new Committee of Council. This, it might have been thought, rather marks out the moment as a convenient one for the reconsideration by Parliament of any part of an educational policy which has hitherto received insufficient attention. It will be for the House of Lords to weigh Lord Norton's arguments in behalf of his motion, but we are unable to see that there is any *à priori* reason against a Parliamentary inquiry whether the assimilation of elementary and middle-class education, which is undoubtedly going in some schools, is in accordance with the intentions of the Legislature. Parliament has never yet laid down to what extent it wishes to aid education, and if it is in future to aid secondary education as well as elementary, it had better aid it under its own name and not under another.

The main complaint of the London School Board relates not to the quality of the education given in elementary schools, but to the length of time at which children may remain at school. This dispute must be carefully distinguished from the larger question, how the average limits of school age may best be extended. The change in the Code against which the petition of the Board is directed is the introduction of a new definition of an elementary school. It is now proposed to restrict this term to schools for children whose attendance is assumed not to extend beyond their fourteenth year, and by another article it is provided that attendance may not be reckoned for any scholar in a day school who is over fifteen years. At present the limit is eighteen years, and a large majority of the Board are in favour of this higher limit being retained. There is a difference of opinion among the members of the Board as to the real significance of the petition about to be presented. Mr. Diggle, who is one of the minority, maintains that the Board "desires the control "of children up to eighteen years of age," and "proposes to educate young people from fifteen to eighteen years of age in elementary schools." Miss Simcox, who belongs to the majority, maintains that the Board "only desires to continue to parents and the managers of all elementary schools the power they have hitherto possessed of carrying on the education of children in exceptional circumstances for a year or two beyond the age of compulsory attendance without forfeiting the claim to Government assistance, and to reserve to itself the power, intentionally granted by former legislation, of establishing evening schools where industrious youths who have gone to work may continue their education a little beyond the modest limits of Standard VI., even, if they wish it, up to the advanced age of seventeen." It is not apparent how the latter object will be interfered with by the alteration in the Code, the provision that attendance may not be reckoned for children over fifteen being expressly limited to scholars in "day" schools. But Miss Simcox, in her praiseworthy desire to promote education, misunderstands the gist of the argument in favour of the change in the Code. There are two reasons why it is not desirable to keep children at school beyond the age of compulsory attendance with the aid of Government assistance—one relating to the interests of the school, the other relating to the interests of the taxpayer. The first is that, if the distinction between elementary and secondary teaching is broken down, it is extremely likely that the elementary teaching will suffer. When the same school contains children who are being taught to read, write, and cipher—so far as these arts can be communicated in the too brief space during which the great majority of the poor can afford to forego their children's earnings—and older children who are remaining at school "under exceptional "circumstances" (the exception usually being that their parents can afford to keep them there), it will be only natural that the teacher should take more interest in the minority than in the majority. They will be further on in their work, they will have come to a more intelligent age, and they will often be children of unusually quick parts. No provision on the part of the school managers can prevent a disproportionate share of the teacher's time and thought falling to the share of this attractive minority, and in so far as this share is disproportionate, it must be so to the detriment of the unattractive majority. If the object of educational legislation is to insure that no child shall grow up destitute of the rudiments of learning, that object will certainly not be promoted by the mixing up in the same school of children who are learning the rudiments and young people between fifteen and eighteen who would not be at school at all if they did not wish to learn something more than the rudiments.

As regards the taxpayers, we have no desire to prejudge the question to what extent secondary education should be paid for by the State. It is enough to say, first, that it ought not to be paid for by the State until Parliament has considered the subject and voted money for the purpose; and next, that, if that money is voted, it ought to be spent in the way that will best advance secondary education. The plan of carrying on the education of children in elementary schools up to the age of eighteen offends against both these conditions. It involves the diversion of Government assistance specifically granted for one purpose to another and quite different purpose. The reasons which make it expedient for children to receive the rudiments of education at the public expense are quite distinct from any reasons which would make it expedient for children to carry on their education up to the age of eighteen at the public expense; and the Legislature which has recognized the force of the former

reasons cannot be held by so doing to have recognized the force of the latter. If Parliament should hereafter desire to aid secondary education, it is to be hoped that it will adopt some more effectual plan than one which should encourage the managers of elementary schools to carry on the edification of a few children under conditions which would be equally unfavourable for the majority and the minority of the scholars.

JOURNAL OF A DOCTOR IN MARLBOROUGH'S WARS.

TRAVELLERS in the East are constantly amused by foolish stories of inexhaustible treasures supposed to be concealed in the ruins of palaces and forts. Englishmen might more profitably speculate on the existence of real treasures of a different kind, much more accessible and nearer home. We do not refer to ingots of silver or pots filled with Roman or Saxon coins, but to books and manuscripts hidden in chests, libraries, and drawers in many a country house in England, never rummaged since the family lawyer made some change in the entail during the life of the grandfather of the present owner. We believe that a diligent search, such as Scott made for ballads in the farmhouses and hamlets of the Border, might bring to light diaries and journals of inestimable value to those who like to penetrate beneath the surface of history and to know how their ancestors talked, dressed, and wrote. One of these waifs and strays of unpublished literature has recently fallen into our hands. It is entitled *Dr. Armstrong's Journal of his Travels in 1708 during the War in Flanders between the French and the Allies commanded by the D. of Marlborough.* As far as we can ascertain, this diary has never been printed. It fills 53 pages of close writing of that clear, bold, and legible type, which in these days of hurried post-cards and needless circulars seems to be a forgotten accomplishment. The journal is divided into two parts, and the covering letters bear date respectively September 25th, 1708, N.S. Leyden, and July 10th, 1711, Douai. The first packet is addressed to the writer's "honoured father" and the second to his "loving brother," and there is a third written to his father and mother, in which this dutiful son sends his parents a copy of the Doctor's degree which had been conferred on him by Adolphus Le Large, Doctor and Professor of the faculty of Physick in the famous University and archbishoprick of Rheims. Of Dr. Armstrong's birthplace, parentage, and town or county, the letters give few particulars. We gather that he lived near Sherborne in Dorsetshire. His diary is made up of odd and interesting details and adventures; and modern special correspondents, scribbling doctors, and irrepressible friends in camp may care to know how civilians fared in days when there were no indiscreet telegrams to carry information to the enemy, and no ready writers who felt quite equal to the task of showing Lord Clyde or Lord Napier of Magdala how to finish their campaigns. Dr. Armstrong appears to have tried to combine professional advancement with sight-seeing; and a spirit of adventure led him into all sorts of queer scrapes, out of which he extricated himself with considerable dexterity. He was once or twice captured by robbers and *francs-tireurs*, and stripped almost to his shirt. Letters addressed to him went astray and took seven weeks to reach their destination. He got no remittances from home, and had to put a bold face on matters, and live on credit. He came in for a night attack when in camp, and heard bullets whistling about his ears. He had a fight with a huge Dutchman. He was taken for a Frenchman and brought before the Great Duke himself. In short, he went through a variety of experiences which are described with no small point and much humour, and we shall endeavour to give their substance as far as space permits.

Leaving Leyden in August 1708, he went to Rotterdam, where all the "yats on the river were hired to meet the Queen of Portugal." At Dort, the chamber where the famous Synod was held had raised his expectations; but it turned out to be "an old tattered room, very like our Church house in the days of old Dyer the Town-clerk." At Antwerp he was "mightily surprised" at the representation of the Virgin Mary on all the corners of the street, as well as at their cloisters, nunneries, chapples, and worship, "than which nothing so ridiculously superstitious." A procession of Notre Dame for the gathering of the fruits of the earth, with a train of tailors, weavers, coppersmiths, bakers, millers, and what not, with poles in their hands on the top of which were "poppets," struck him as the oddest thing he had ever seen. A company of Jesuits extravagantly decked out in gold and silver was followed by a company of Jack Puddings in blue and yellow, who made melodious music, though every one, like the proverbial Dutchman, beat his own march and played his own tune. Afterwards this "Thomas Armstrong, living in Holland," obtained from the French a document allowing him to pass and repass, for which he had to pay one pistole; a sum which he grudged less than a like amount paid for a berlin of the same nature as our Hackney Coach. "This last was the worst spent money as ever I bestowed." We regret to say that this was not his only piece of ill-luck. The berlin was stopped by two men who took him for a German, but let him go, only to fall a little further on into the hands of forty or fifty Frenchmen, who paid no regard to the King's pass, on the ground that the Duke of Marlborough had intercepted some wines and provisions of the Duke of Burgundy. However, the Duke of Vendôme, "attended by the French Princes of the blood and the Chevalier de St. George, alias K. J. the 8th, alias the Pretended P. of Wales," spake the captives civilly, and allowed them to walk about in the town of Ghent. While examining the fortifications, "rampiers," and palisades, he chanced to come on his friend Sir Henry Sterling looking out of his prison, who, with his uncle Aisking (Erskine) of Edenburg, was in a very "indifferent pickell," but overjoyed to see an English face. Soon after this the whole party were liberated and they went over the field of Oudenarde. At this point some proposed to buy horses and ride, but our Doctor thought the price extravagant, and preferred to walk with a Highland gentleman, one Sincklar (Sinclair), related to my Lord Sincklar, student of law, of the strongest body, and the best swordsman in Leyden. This walking tour, however, turned out very indifferently. Heavy boots, a frieze coat, and a musquet were inconvenient under the sun of September; and, when they reached the English camp, they could hardly get to the tent door. Here the English and French armies were only a league apart. They chanced to light on a friend in one Captain Armstrong, and were much edified by divine service, performed under a canopy with a drum for a desk. Then they were very anxious to see a real battle, but all expectation came to nothing. However, as the Doctor was at breakfast, a stray cannon ball took off the head of the Prince of Orange's valet, while a bullet sent from the citadel very nearly "spoyled the edging" of this worthy Doctor's hat. He takes care to tell his father, "If I had a call to approach the enemy, I value the cannon as little as any man." But at the same time he admits that he cut a caper when the balls came tumbling about him and the earth trembled. He adds, "I now verily believe I should make a good souldier, if all trades fail." The upshot of all this excitement was that at last he did witness something of a fight. How and Temple's regiments went out to drive away some French foragers; Colonel Armstrong led on his men, as sedate and unconcerned as Marlborough himself; and in less than half an hour the green was covered with the dead bodies of Frenchmen, and the English returned to their dinner with a good appetite, having soundly thrashed the enemy. The Doctor and his friends then left the camp to encounter worse dangers than the bullets from Lisle. In a wood near Grammont they were attacked and disarmed by a party of deserters, and fully expected to be flung into the nearest river. How he told "Sincklar" to prepare for another world, though convinced that a dying hour was no fit time for repentance; how he was deeply affected with the recollection of his father, mother, brother, and sister, and Poppum Lane; how one of the marauders handled his gun very carelessly; how the writer, seeing a chance, had a great desire to kill the captain of the band but was prevented by a cautious divine of the company; how the captives were stripped of shirts, cravats, and hats; how, like Dominie Sampson when feasting with Meg Merrilies in the ruins of Derncleugh, Dr. Armstrong fairly drank to the marauding Captain's health in a glass of sound Geneva; and how they were all finally let go with a few shillings to take them to Leyden, is very naïvely told at too great length for us to reproduce. A Popish priest, however, took compassion on them and gave them a meal in a country house and good straw to lie on, and so they eventually got safe to Brussels, Antwerp, Rotterdam, and Leyden. The first part of the journal ends here with the satisfactory announcement of the receipt of a letter from home, and one hundred guilders from young Mr. Vicary, of Exon.

We fear that some of the correspondence has been destroyed or lost, for the second part of the journal bears date later by three years than the first, and refers to letters "as usual." From this date there is a cessation of fighting and looting, and we get instead an account of the writer's increasing practice with hopes of becoming Physitian Extraordinary. We find a mysterious notice of a legacy or fortune of 7,000*l.*; mention of scarcity of provisions in England, and of the extravagant prices at French ordinaries, and the strange cookery of frogs and mushrooms with the tail of a rat and a bat's wing; sundry regular visits to the hospitals; the prayer of a Scotch doctor for mercy on tavern keepers, that "ha' sic a conscience as to tak twa shilling for the wee bit that I ha' eaten"; and other incidents of life at Douai. From this town an excursion was made to various places in the Low Countries. At Rotterdam he had his fight with a huge greasy butter-box of a Dutch skipper, whose head and shoulders were of the right bear-garden breed. The language is somewhat metaphorical, but we gather that our Doctor's physical education had not been neglected and that he fairly put his adversary to the rout. At Cambray he heard what he terms a doleful relation of some soldiers being buried alive at the rear of the English camp by a certain Colonel Pococke, and we at first thought, with feelings of horror, that Netherlandish atrocities might have outdone even the massacre of Glencoe. But a few lines further on we discovered that this Colonel Pococke was only a practical joker in his way, and had simply consigned to earth, not the persons of his soldiers, but their huge wigs, because he disapproved of this fashion as unsoldierlike and disadvantageous to their appearance. This solemn interment of the offending head-dress was talked of in camp as "a good comical whim." This is followed by an anecdote of a pot-valiant captain who, returning to camp, challenged a horse, mistaking it in his cups for a man, and put the animal to flight. This is described as not paralleled by anything in Parysmenos, Don Bellion of Greece, Montelion Knight of the Oracle, or in the renowned history of the Seven Champions of Christendom, "No! would you sift Don Quixote throughout." We

should note here that, in order to get to Cambray, the author had to pass through French territory, or territory in occupation of the enemy, where *Areste vous* soon brought him up. Like poor Tom, he was carried from tything to tything, and brought before the Governor, who required a substantial person to answer for his honesty, and sent him on to St. Kantine (St. Quentin) with a file of musqueteers. Between Cambray and St. Quentin he was invited to pray for the soul of the Dauphin by a queer sort of circular, adorned with a death's head and cross-bones, in large character, and printed on royal paper. Every one was praying for the deceased and fasting to an extraordinary extent. But, though "extravagantly religious," the inhabitants were remarkably unpleasant in their complexions, being like so many apparitions of Westphalia hams. On this march Dr. Armstrong had to submit to what he regarded as the intolerable inconvenience of drinking champagne and burgundy instead of "beere and ale." Passing through a small town he was courted by women, whom he believed to be "very honest too." He had to take to his heels and seek a sanctuary in a house full of chapmen and pedlars, who plagued him to buy rosaries and beads and images of saints, and ended by excommunicating him for "a d—d son of a Huguenot." To cover his retreat he scattered some copper coins among them while they sang "Ora pro nobis" as merry as crickets, and promised to repeat so many "Ave Marias" and so many "Pater nosters" at such and such altars for his prosperous campaigns.

He then trudged on over hills and through "tattered villages" till he could discern the spires of Rheims. All this time the excessive heat of his upper coat made his body in a very greasy pickle; his hat scaled and snapped like puff paste; and his face and hands were tinged of a curious saffron dye. On arriving at Rheims he challenged all the Professors to a trial of skill at back-sword, quarterstaff, case and faulchions, which, he explains, are synonymous terms for botanic, anatomic, and pharmasie. We confess our ignorance, as but for this timely explanation we should have imagined that, like Friar Tuck, this valiant Doctor had intended to make his quarterstaff ring noon on the head of a rival veteran in the art. The combat lasted for two hours. He had been primed with a bottle of that champagne to which a short time previously he had preferred honest English ale. It is not surprising that all the Professors, who were six times his number, could not give him a fair fall, but they brought him, he confesses, on one knee. We regret that, in utter disregard of modern Boards of Examiners, there is no trace of the questions or theses preferred to the candidate. But it is clear that the most rigid requirements of the profession were satisfied, for they "clapt an antediluvian cap on my head, which never sees the sun but on such an occation, and then, with one voice, 'twas, 'rise up Doctor Thomas Armstrong, you are a person worthy to ride in our troop.'" Molière, we may remember, not many years before this time, had described a similar scene with the refrain, "Bene bene respondere; dignus es intrare in nostro docto corpore." Still admission was not obtained without payment of fees, which were doubled because the candidate was neither an Irishman nor a Roman Catholic; but the Professors, after all, dismissed him with a blessing, gave him copious advice about his practice, and recommended him to sell packets of drugs at every market town, with the addition of a tumbler or Jack Pudding, such being easy to find in that country. Returning to St. Quentin he joined a party attended by a military escort, as there was little else but robbery and murder stirring in the country, and sure enough, near a wood, one of the King's guard was shot in the belly by two or three fellows. The accident was, however, very commodious, as there was a "chapple" hard by, in which this unlucky dragoon was provided with snug lying and a split willow stuck at the head of his grave. No wonder that these "sly tricks," supposed to be played by peasants, possessed the author "with a desire to get into our own garrison." Nothing further happened on this tour, except that they fell in with some Frenchmen, one of whom hazarded the remark that one of King Louis's household would put four Dutchmen to flight, but, as for the English and their d——d predestinarian principles, there was no hope of winning a field from them, until they were cut to pieces. Here, in spite of his pass and the civility of the Governor of Cambray, he was ordered to be taken before Marshal Villars; but he managed to slip away in the night by a back door, and reach the English lines, where a North British Sergeant received him, and made him a delicious dish of Scots collops, with brown beer and Geneva to boot, without charging him as much as one farthing. As a set-off against this civil treatment some rudeness was shown by our Danish allies, who taxed him with concealment of his profession, put him into the custody of some surly fellows, and made him pass one night in a sutler's tent, on the bare ground, where he had to console himself with a can of flip. When brought before our Duke and asked if he was related to the Armstrong with Prince Eugène, he very prudently replied that he was related to all the Armstrongs, whereupon he got back his sword and his liberty, and, meeting with a friend in Dr. Sandilands, obtained his remittances and paid all his debts.

It is satisfactory to be assured that after these escapes, adventures, and penurious struggles, he set himself seriously to the practice of his profession, found the physicians wonderfully civil, gained experience in all sorts of cases, and made a shift to live out of fifteen shillings a day. Somehow his conscience seems to have been a source of disquietude to him, and we have an insight into two dreams about a squadron of French ghosts, a churchyard, a skeleton, and two musqueteers sent by the Universal Monarch to despatch him in a minute. But he awoke, and "behold it was a dream." The Diary concludes with a night attack made by some 8,000 French on Palm's regiment, which they entirely demolished; to be stopped in their victorious career by other British boys in their shirts and boots, and no coats or breeches. The hail of bullets led the author seriously to reflect that, though he fully designed to die on a bed of honour, a doctor was a person worth taking care of; so, like a man of honour, he ran away, guided by the light of the firing and more than ever confirmed in his predestinarian principles. No one, we are happy to record, blamed him for this *celerem fugam*, unless it was when he stood a few minutes to look for his breeches, in which were two or three guilders. We cordially endorse the concluding sentence of the Diary, where our correspondent holds that his epistle differs from the common sort, being entirely good nonsense, begin or end where you please. A man of such opportunities and activity of body would, had he lived in our time, have probably increased the revenue of the Telegraph Department by paying heavily for columns of flashy narrative, impudent attempts at political and military dictation, and grotesque errors of fact. As it is, he has left us a diary which, disfigured by a little egotism and by only occasional coarseness, is conspicuous for quaint touches of humour, and for a simplicity and a truthfulness which we may look for in vain in many a budget from Zululand or Cabul.

POLISHING OFF PEAKS.

IF there were many climbers equal to Mr. Edward Whymper the world would soon have need of a fresh supply of mountains. Mr. Whymper, as we learn from a letter printed in the *Times*, has lately been "doing" a few little hills in Ecuador. He has passed "twenty-six consecutive hours on the top of Cotopaxi," and he has succeeded "in polishing off Chimborazo, Corazon, Sinchólagna, and Antisana." He has learnt, as he tells us, how to be "quite gay and lively" at a height of 19,500 feet. At the date of his letter he was about to set out upon a fresh excursion, in the course of which he hoped to "polish off Saranen and Cotocachi." He has his eye on an active volcano, whereof the precise height is as yet unknown; and in the meantime he complains bitterly of the "way in which one's time gets muddled away" in this interesting region. It appears that "directly you get into a town or village you seem to be stuck fast." With the best intentions, this energetic mountaineer cannot escape from the dulness of the plains; and, apart from other obstacles, one of Mr. Whymper's guides had had his feet frost-bitten, so that for five weeks he was utterly useless. This, it may be admitted, is altogether inexcusable; and all mountaineers of right feeling will sympathize with Mr. Whymper's annoyance. Their sympathy will perhaps be increased from a knowledge of the fact that these daring ascents are wholly disinterested. Mountaineering in Ecuador so far resembles virtue that it must perforce rest content to be its own reward. The climate, we are candidly informed, is the "most utterly abominable that can be imagined." It is in vain that Mr. Whymper abandons the monotonous life of the towns; for, however lofty his position, he can get no clear view. During the whole time of his sojourn among the hill-tops he has not been favoured with one clear day. He has scaled the most difficult peaks; but wherever he has gone he has found everything "bottled up in a mist," and an hour of clear weather from six to seven in the morning is the utmost concession that he has been able to win from the hostile elements. It is evident, therefore, that Mr. Whymper's ardour as a mountaineer has not been complicated by any guilty weakness for the picturesque. A lofty peak is in his eyes a huge object hidden in a fog which requires to be "polished off." Once this desirable result has been attained, the conquered mountain retires into obscurity, or is handed over to those feeble sentimentalists who gaze at its majestic form from the level of the plains.

It is doubtful whether climbing, considered as a separate pursuit, is capable of much further development. Within a very short space of time all the inaccessible heights of the world will have been successfully "polished off," and some new and more exciting occupation will have to be found for the enterprising members of the Alpine Club. This aspect of the question suggests a very difficult social problem with which a future generation will have to deal. Mountaineering in its modern sense has created a distinct type of manhood which imperatively demands fit and sufficient exercise for its strength. To make mountains out of molehills is an achievement only possible in the sphere of moral ideas, and yet, unless these gentlemen can be supplied with new and difficult peaks as they are required, society will be threatened with a grave danger. For it must always be an element of peril to the well-being of the community when a strong and able-bodied class of men are thrown suddenly out of work. High-spirited climbers like Mr. Whymper will never consent to interest themselves a second time in peaks that have been once "polished off," and the day is fast approaching when even an "active volcano" will seem but a tame affair. What then, it may be asked, is to be the future of this formidable band? If the boasted playground of Europe could be blown up by an explosion of dynamite on a colossal scale, such well-worn and hackneyed peaks as the Matterhorn might perhaps take a novel and interesting shape. The jaded appetite of the Alpine Club would submit to a momentary revival, and the labour of "polishing off" would have to be taken over again. But even this, even if it were possible,

would be but a tinkering attempt to solve a serious problem The world we live in is after all but a very small place, and to no class must it seem so small and uneventful as to the professional mountaineer. No attempt to reconstruct the surface of the earth upon any human plan which scientific ingenuity could devise would satisfy their just aspirations. Society in regard to their ever-increasing requirements will speedily find itself in the difficulty that has to be encountered by a powerful monarch with an enormous standing army. An extensive war may meet the immediate danger, but it only serves in the event to strengthen the spirit which has rendered war a necessity. We would strongly deprecate, therefore, any attempt to tamper with the surface of the earth in order to satisfy the Alpine Club. Concessions of this kind offered to a dangerous class only increase their influence, and it would be wiser to try to devise some vast scheme of aërial emigration which would place them in possession of another and a more mountainous planet. And, after all, the problem to which we have referred, although full of danger for the future, scarcely concerns the present age. We ought rather in our time to indulge a just feeling of pride that the process of "polishing off" has been so nearly completed, and that this result is in so large a measure due to the energies of what is called the Anglo-Saxon race. Thanks to the untiring devotion of the Alpine Club, even the most mighty mountain is now clearly demonstrated to be but a poor and petty exhibition of nature, which is fast failing in attraction even for the class for whose special amusement it may be said to exist.

It would be a curious speculation to consider in what degree this modern pursuit of mountaineering will ultimately affect the sentiment of the picturesque. There was a time when the hilly regions of the world were regarded with a feeling almost of dread and repulsion. The lack of appreciation for the beauty of the wilder forms of nature which characterized preceding centuries has perhaps been exaggerated, but there can at least be no question that the passionate love of landscape is in a special sense the property of the modern spirit. Under the austere genius of Wordsworth mountains began to be reverently worshipped. The puny little specimens of natural grandeur which sufficed to excite his imagination would now be greeted with derision by the Alpine Club; but the sentiments which he sought to express found a genuine response in the prevailing spirit of his time. Since Wordsworth's day, however, mountains have been made to step down from their pedestal. His attitude of grave and yet fervent admiration has been exchanged for a more familiar knowledge, and the world has learned to place itself upon easy and intimate terms of relationship with peaks that seemed to be of awful and inaccessible grandeur. Thanks in a great degree to the efforts of the Alpine Club, the mountain is now shown to be a very commonplace manifestation of nature. For a while certain individual peaks retained a measure of distinction, owing to the doubts that were entertained as to the possibility of getting to the top of them. But one after another these unfortunate hills have been forced to lower their pretensions. They have, in fact, to quote again Mr. Whymper's expressive phrase, been completely "polished off," and the result, although admirable in itself, has been almost fatal to their reputation. No modern mind can entertain much respect for a hill which it is possible to climb. And with the loss of respect, there goes also the sentiment of beauty; for it would be idle to urge the claims of any mountain which is known to be classified in the Transactions of the Alpine Club as a peak of the second, or perhaps of the third, class. It is possibly due to this cause, as much as to an inevitable reaction from the earlier enthusiasm, that the lovers of the picturesque now show a decided tendency to revert to the beauties of uneventful landscape. The flat or gently undulating places of the earth are once more to be allowed a chance, and painters are already turning their attention to the study of a kind of beauty such as would formerly have been deemed unworthy of consideration. In a little while poetry will perhaps follow the lead of art, and Switzerland, deserted and neglected, will cease to exist save in the memory of mountaineers of the old school.

DEAN STANLEY ON ROMAN VARIATIONS.

DEAN STANLEY is nothing if not picturesque. It is perhaps unfortunate that theology should have become—we cannot say his special study, for he knows very little about it—but his special profession and fancy. It affords less scope than some other subjects for original treatment, and what Luther said of ignoring it altogether may be applied with even greater force to those who handle it without adequate preparation, *neglectum sui ulciscitur*. Still, when a clever man of versatile intellect and considerable power of expression, and with an abnormal capacity of seeing a long way into brick walls—accompanied, as is natural, with an equal incapacity for seeing what is obvious to ordinary eyes—undertakes to give us his views on a question which he has thought a good deal about, and on which he believes he has something to say, he is pretty sure to be more or less interesting, though the interest may be quite as much due to the eccentricity of his mistakes as to the value of his discoveries. The Dean is hardly the most competent person to break a lance with the illustrious author of the *Variations of Protestantism*. However, he has convinced himself that much instruction may be derived from a bird's eye view, in a friendly and appreciative spirit, of "the Variations of Catholicism"; the chief advantage being, if we rightly understand him, to prove how great a blessing it is to the world that Christianity should be split up into some hundreds of conflicting sects, and that all of them—the Roman communion included, if she would only recognize her true blessedness—are habitually inconsistent, not only with each other but with themselves. In regard to the Roman Church he proposes to exhibit this inconsistency, in his paper in *Fraser's Magazine*, by examining her condition first before and then after the Reformation. That he has made some telling points we are far from wishing to deny, though, even where he is right in the main, his statement of the case is seldom free from blundering or exaggeration; but he also falls into many conspicuous mistakes, both in his facts and his inferences, to some of which we shall presently call attention. The principle from which he starts, though characteristically overstated, is an important but hardly to any student of Church history a novel one. That the mediæval Catholic Church, which included the whole of Europe, included many elements which have since been drafted off into Protestantism, is obvious on the face of it, and it follows that a certain historical continuity has been preserved in both the great divisions of Western Christendom. But to say that this continuity—meaning thereby moral continuity, not episcopal succession, which lies entirely beyond the purview of the article—has been maintained "in the same sense" in the "Churches of England *and Scotland*"—*i.e.* the Kirk—as in the Roman Church, is simply paradoxical. It puts rather a strain on our powers of imagination to be told that not only "is Leo XIII. the successor of Gregory the Great in the same sense as the present Archbishop of Canterbury is the successor of Augustine," but also in the same sense as "the present Principal of St. Andrews is the successor of the first Provost, appointed by Bishop Kennedy." However, the Dean has a substratum of fact to go upon here, and he illustrates the presence of what he calls Protestant elements in the ante-Reformation Church happily enough by reference to "the free-spoken language adopted both by clergy and laymen before the Reformation, on the subject of ecclesiastical abuses." He might have added the free-spoken language of Councils, for there was hardly a mediæval Council, General or Provincial, that did not ring with the denunciation of clerical abuses, and make at least some attempt, however ineffectual, to remedy them. But it seems to have escaped his notice that the explanation of this contrast between mediæval and modern practice—which by no means applies exclusively to the Church of Rome—is not far to seek, and does not altogether bear out his view of the unmixed "benefit to the world" of what the Prayer-Book calls "our unhappy divisions." As long as human nature remains what it is, people will have an instinctive dislike to "washing their dirty linen in public," and therefore while Christendom is divided into a number of antagonistic, or at least rival, Churches, the members of each will be apt to make the most of their neighbours' failings, and do their best to conceal or extenuate their own. In the middle ages there was no risk of having to wash one's dirty linen in public, because there was no outside public to witness the unedifying spectacle. Men could afford to be free-spoken because they were speaking among friends, and it was the common interest of all who cared about religion that "the great roomy universal Church"—to use a phrase of George Eliot's—to which they all belonged, should be kept decently and in order.

The Dean's first detailed illustration of his thesis no less strikingly illustrates his own peculiar idiosyncrasies of method and view. He has got hold of an important fact, which has for obvious reasons been too much overlooked by controversialists, and is quite worth noting; but in his usual fashion of overstatement and misstatement, he mixes it up with what are not facts at all, and puts on it an interpretation of his own which would have not a little amazed those immediately concerned. Referring to some significant disciplinary and ritual changes which took place in the thirteenth century, he tells us that "in the middle ages the two sacraments were *completely transformed*." The phrase "the two sacraments," if it is anything more than a slip of the pen, is an unfortunate one in every way. In the first place, the Dean at once proceeds to speak not of two ordinances but of three—Baptism, Communion, and Confirmation; in the next place, he must be well aware that the Church of Rome at the period he refers to had for several centuries recognized seven sacraments, while the dual enumeration did not come in till three centuries later, at the Reformation; and lastly, his supposed "transformation" of Baptism is a mare's-nest. His point is that in the thirteenth century the administration of the Eucharist to infants, which had invariably prevailed throughout Christendom up to that period as is still the case in the Eastern Church, was abandoned; that the form of Baptism was changed from total immersion, which "its name indicates," to "the totally different rite of sprinkling"; and that "Confirmation was deferred to an age of consciousness," meaning apparently age of reason. The abolition of infant Communion was undoubtedly a very sweeping innovation, far more so under some aspects than the contemporaneous withdrawal of the chalice from the laity (which the Dean does not notice at all), as it altogether deprived a very large proportion of the baptized members of the Church—something between half and a third probably—of the Sacrament which had always before been administered to them. That so little notice has been taken of this momentous change in later ages, while the controversy has raged so hotly over the administration of Communion under one kind, arises of course from the fact of all the Protestant

bodies having followed the Roman "innovation" on the one point—as also in the postponement of Confirmation, where the rite has been retained, "to an age of consciousness"—while returning to the earlier usage on the other point. The custom of deferring Confirmation came in, however, very gradually in the Latin Church; it was often administered to infants till a different rule was established by the Council of Trent, though its reservation in the West to the Episcopal order made it impossible to follow the Eastern usage of regularly uniting it with the administration of Baptism. There is a curious survival of the old tradition in the note appended to the English Baptismal Office stating that baptized children, dying before they commit actual sin, are undoubtedly saved, which was inserted to meet the scruples of parents who were anxious about the salvation of their children when dying unconfirmed. We cannot however agree with Dean Stanley that "no more severe blow has ever been dealt against the magical and mystical theory of the sacramental system" than by this deferring of Confirmation and first Communion, considering that the "magical and mystical" use of infant Baptism was retained, and that nothing was further from the thoughts of those who introduced the change than to disparage the validity of infant Communion. As to Baptism the Dean is doubly, or rather trebly, wrong. "The rite of sprinkling" or aspersion has never been sanctioned by the Roman Church, and finds no countenance in the rubrics of the English Prayerbook. And the late Mr. Wharton Marriott has shown, in his learned article on the subject in Smith's *Dictionary of Christian Antiquities*, first that the word "baptize" may just as well signify pouring or affusion, which is the form sanctioned by both the Roman and Anglican ritual, as immersion; and, secondly, that both practices had existed side by side in the Christian Church from a very early age. To speak of the transition from immersion to affusion as strictly analogous to "the abolition of the water of baptism by the Society of Friends"—*i.e.* the disuse of the sacrament altogether—argues a daring to which we should scarcely have expected even Dean Stanley to be equal. It is a lighter matter that he should speak of the Canon of the Mass "containing two elements entirely incompatible with two of the most widely recognized doctrines of the Roman Church," one of which elements does not occur in "the Canon of the Mass" at all, while the supposed incompatibility of either with Roman doctrines rests only on his failure to comprehend their meaning. Neither again would anybody not gifted with his singular capacity for discerning non-existent distinctions and ignoring those which are real, imagine that to recognize the nullity of marriage in certain cases "amounts to the same thing" as the permission of divorce, or that clerical celibacy is more than a disciplinary institution which the staunchest infallibilist would allow to be variable in its own nature and one about which the Church might conceivably make mistakes.

But the strange mixture of "*facta, infecta*" which constitutes so marked a peculiarity of Dean Stanley's method may perhaps be most readily exemplified by examining three of his consecutive points; on the first of which he appears to us to be substantially right both in his facts and his inference; in the second, right in his facts, which however are for his purpose irrelevant; in the third, entirely wrong in his facts from his ignorance or contemptuous ignoring of ordinary theological terminology. First comes a reference, which he has probably borrowed from *Janus*, to the extraordinary variation of Papal decrees on the reality of witchcraft and the lawfulness of usury. Of the fact there can be no doubt, and the points at issue do touch directly on questions of faith and morality. Not so the Dean's next example, which concerns the different treatment of actors in the French and Italian Church. But that is a mere point of detail, which might very conceivably and not unreasonably be affected by differences of time and place, just as the opinion of religious people as to the lawfulness of attending theatres might be largely affected by circumstances of the kind. In his third example the Dean has touched indeed on an important matter of doctrine, but he entirely mistakes his authorities. We are first told of a devotional work by a certain Dr. Furniss, published *permissu superiorum*, which contains, we believe, very startling and repulsive descriptions—though not worse than may be found in some Protestant works—of the future torments of the wicked. It is then added, truly enough, that "nothing could justify such a publication except the most absolute certainty *on the subject*," the subject evidently from the context meaning, not the particular details of Dr. Furniss's book—which he would no doubt himself allow to be matters of opinion—but the doctrine of eternal punishment itself. Now there is not a shadow of doubt as to what the doctrine of the Church of Rome on that subject is. The Dean however observes that it is an entirely open question:—

Not only are there expressions of a totally different character in Tertullian, Origen, St. Gregory of Nyssa, St. Gregory of Nazianzus, St. Ambrose—the three last recognised by the Roman Church as canonised saints—but even in modern times a brief but significant hint is dropped in a footnote to a well-known work by the foremost theologian of that Church, that the Catholic Church has never ruled anything at all on the subject.

As to his patristic authorities—among whom, by the way, St. Ambrose and Tertullian have no business to appear—it would strain even the ostrich stomach of the extremest Vaticanist to digest a theory of infallibility which made the Church responsible for all the statements of her accredited or even canonized writers; and Origen was condemned, instead of being canonized, expressly on account of his alleged heresies on this matter. But the appeal to Cardinal Newman's authority is the most infelicitous, though it is due to Dean Stanley to say that he gives his readers the opportunity of appreciating its value by quoting in a footnote the passage cited from Petavius in Dr. Newman's *Grammar of Assent*: "De hâc damnatorum saltem hominum *respiratione* nihil adhuc certe decretum est ab Ecclesiâ Catholicâ." Petavius, whom the illustrious author of the *Defensio Fidei Nicenæ* counted a foeman worthy of his steel, is no doubt one of the highest theological authorities of the Jesuit Order and of his Church during the last three centuries, and his statement cited by Cardinal Newman is so unquestionably true that every tiro in theological literature knows it to be almost a truism; but the Dean has entirely misconceived its meaning through a misconstruction of the critical word *respiratione*, from which his knowledge of Latin, if he knew nothing of the theological question involved, might have been expected to preserve him. *Respiratio* does not mean restoration, as the Dean's argument requires, but a respite or intermission of suffering, and it has been a very general opinion among Latin theologians of all ages that there may be in course of time a mitigation or even total cessation of the bodily sufferings of the lost; and on that point, which is quite distinct from the doctrine of eternal punishment, the Roman Catholic Church has certainly pronounced no decision. Of course we merely refer to the matter here as illustrating the Dean's ineradicable confusion of thought.

On one point where it was scarcely possible for him to go wrong, as to the marvellous divergences in the Roman Church on Papal infallibility, he has said what is very true, though it has often been said before. And as the matter is of considerable interest, as well for those without as within the Roman pale, and the case is fairly and forcibly summed up in the following passage, we will conclude by presenting it to our readers as it stands:—

Compare the language of the Spanish or French prelates who promoted the dogmas of the Vatican Council with the language of the Irish Roman Catholic prelates who, in answer to the question, "What is Papal Infallibility?" caused the catechumen to reply "It is a Protestant Calumny." Compare the almost adoring language held by extreme Ultramontanes respecting Pius IX., with the latest utterances of Montalembert, who spoke of him as "the idol in the Vatican"; or with the contemptuous style in which the whole subject was treated by the distinguished Catholic laymen who, for a short time, ventured to express their opinions in the public journals of England. Compare the language of the two highest Roman authorities in England. One of them supported with all his energy the promulgation of the dogma, and afterwards spoke of its importance and its force in the most unqualified terms. The other regarded the formation of the dogma as the work of "an aggressive insolent faction which," as a student, "he could not defend in the face of the facts of history"; and, even after accepting it, he reduced his allegiance to the very minimum of which human language is capable. Or, again, consider the assertions of those members of the Roman Communion who declare that they have acquiesced in this dogma, to their co-religionists so important, only on the understanding that as no Pope from the beginning of time ever has spoken authoritatively, so it is probable that no Pope to the end of time will ever so speak; or, as another alternative, that the moment any Pope falls into error, that moment *ipso facto* he ceases to be a Pope, and therefore, ceases to speak as an authority. And to these variations amongst theologians we ought to add those still wider divergences which exist amongst the large classes of the Roman Communion, whose numbers form a material element in the dazzling pretensions which it puts forth; and yet of whom it is not too much to say that, both amongst the educated and uneducated classes, there are thousands to whom the Pope's claims to infallibility are entirely inoperative. It might perhaps be asked whether, even amongst the strongest upholders of the dogma, any one ever quotes or accepts it except on behalf of something to which he is previously inclined. For all other cases, the qualifications in reserve are so large and numerous as to supply some means of escape.

THE SWORD OF OUR FATHERS.

THE sword of our fathers has again been drawn from its scabbard. We do not mean the sabre so dear to that sweet damsel the Grand Duchess of Gerolstein, but a much more deadly weapon, and one pointed at a far more august throat than any of the antagonists of the redoubtable Fritz. The existence and the use of this most necessary instrument of defence, even more than of defiance, was revealed to us just eleven years since by the very man who is now quivering under its gleam. So certainly in every age does the doom recur

Fas necis artifices arte perire suâ.

February 23, 1869, was a day to be much and long remembered in our Parliamentary history, for upon it a great man made a great maiden speech at a great constitutional crisis. A wicked lord, Bury by title, with the characteristic effrontery of an hereditary aristocrat, asked leave of the House of Commons to bring in a Bill to relieve from the burden of re-election those men of light and leading whom Her Majesty might summon to her counsels. The House was aghast at the audacity of the heir of the Keppels; but at first it could only find expression in the deep utterances of Mr. White, whilom "the Plymouth Sound," but then member for Brighton. Presently, however, from below the gangway on the Ministerial side a majestic form uprose, and Parliament first heard the solemn, solid boom of that voice whose "Turn them out" has been scattering confusion among the Tory hosts.

No mock-modest protestations preluded, no girlish excuses weakened, the words of wisdom which fell from the mouth, *magna sonaturum*, of William Vernon Harcourt. The hour had come and the man, and the Commons had only to listen and be instructed. The case was desperate, in spite of Mr. Gladstone and his great majority of that Session; for, as the member for Oxford

observed:—"He could not forget that this was a Bill to abrogate a principle which was coeval with—he might almost say congenital with—our present system of Parliamentary government"—namely, by necessary sequence, the reign of Queen Anne. True it was that the provision was originally enacted from jealousy of the power of the Crown, and that the poor Crown had now no longer any power of which the most austere demagogue need be jealous. But, as the tyrannical Crown waned, another tyranny as oppressive, to say the least, and as odious to the Liberal instincts of the people, had grown up, that many-headed monster "the Executive"—the Cabinet, in other words—in which, of course, so far as the Executive crosses the path of the citizen, its most offensive member, by the nature of his repressive powers, must always be that despot who holds the strings of Home affairs:—

It was because the provisions of the Statute of Anne were a safeguard against the power of the Executive that it seemed to him quite as necessary at the present moment as at any former period of our history that they should be religiously preserved and jealously maintained.

Minions and sycophants might gloat over the fiction that it was the Sovereign who made the Ministers. So the Sovereign might do in theory; but after each choice there was a "fundamental principle" which decreed an appeal to a more august tribunal—the constituency which had elected and sent that man to Parliament; and as the constituencies, dealing with each Ministry as a whole, might "turn them out" at the first opportunity, so each constituency has the absolute right to claim the option of "ratifying" or refusing to ratify the Sovereign's preference, by turning out of Parliament that representative whom the Queen may delight to honour, but whom the householders, supreme at the ballot-boxes, may in their religious jealousy desire to abase:—

The principle laid down in the Act which his noble friend proposed to repeal was this—that the choice by the sovereign of her Ministers should be ratified by the people as represented by the constituencies who elected them. This was a principle which for a century and a half had been fundamental in the English Constitution, and he confessed he was at a loss to conceive what were the grounds on which the noble Lord proposed that it should be changed.

So far we have been listening to the patriot, the sage, and the statesman; but Mr. Harcourt soon soars on the wings of his impassioned argument to even higher regions, and catches something of the old prophetic strain. At distant intervals, as we know, it has been vouchsafed to some few elect geniuses from Balaam downwards to predict, unconsciously it may be and unwillingly, but unerringly, their own latter end. Among these great men Mr. Harcourt took his stand, when, with impressive earnestness, "He ventured to protest against what Lord Castlereagh would have called an 'ignorant impatience' of small inconveniences when dealing with great constitutional principles." True, Mr. Hall may shut the door of the House of Commons in the face of the Home Secretary while his new honours are fresh upon him; but this will be—for "Historicus" has told us so—a "small inconvenience"; and it would be "ignorant impatience" on the part of Mr. Gladstone to complain—Mr. Secretary himself would never be guilty of such littleness—of an accident which was at the same time the vindication of those "great constitutional principles" which compel our modern Hampden to try conclusions with an oppressive and unscrupulous "Executive," whose appointment remained to be ratified by the electing constituencies.

But the Statute of Anne was something more brilliant, something keener and more cutting, even than an assertion of principles. In the words of our inspired seer:—"It had done great service, and he believed it might do great service again. It was the sword of our fathers, and it was our duty to keep it bright and burnished as we had received it from our ancestors." Belief is now swallowed up in fruition. The day of the renewed "great service" has come indeed; the "sword of our fathers," bright and freshly burnished, has been received by the avenger Hall. The souls of our Whig ancestors are looking on, from wherever Liberal statesmen go, at the clash of fundamental principles. It is a strife of heroes, each strong in the consciousness of duty to be fulfilled; each vying with the other which shall show most godly reverence for the immortal principles of the Statute of Anne, the one by action and the other by endurance. Whether the result may show that Mr. Hall be destined to lay low his majestic foe, or whether the intention of martyrdom on the part of our prophetic Secretary may be accepted as equivalent to the actual suffering, certain it is that he has been spared to give a point and reality to the maiden utterance of his Parliamentary Muse which even he in the first glow of his earliest triumph could hardly have ventured to anticipate.

Then, if the anticipations of the *Times*, strong in the longings of a new love, of the *Standard*, candidly friendly to its ancient comrades, and of the penitent *Pall Mall* should be justified by the rout of Hall and his abandoned Tories, a reception for the great statesman, unique in its attributes, should be provided. Considering the crowded state of the London streets in the pious and pictorial month of May, we should hardly counsel Danish cattle being harnessed to his triumphal car. Let the ceremony be reserved for the inside of St. Stephen's. The Speaker will smile with affable condescension on Mr. Secretary as he advances up the floor, robed in the silken vestment of a Queen's Counsel, though upon his head he carries no horsehair disguisement of a plodding advocate, but the laced hat of a Privy Councillor, while he bears in one hand the Seals of the Home Office, and in the other the bright and burnished brand Excalibur torn from his discomfited assailant. To his right flank and his left will cling his introducers, whom he may choose from Bristol and Northampton; and the clerks at the table will chant in harmonious accord, to the chaste melody of Offenbach:—

> Voici le sabre de nos pères:
> Tu vas le mettre à ton côté;
> Ton bras est fort, ton âme est fière,
> Ce glaive sera bien porté.

TURNING OVER A NEW LEAF.

It is a great pity that when Mr. Sambourne, a week or two ago, drew that clever picture of tacking yachts, with a certain very well-known broadsheet figuring on the mainsail of the foremost, he did not know of the metamorphosis which awaited our contemporary the *Pall Mall Gazette*. A pleasing little sketch might have been made in the corner, representing the captain and crew of one bark undergoing the fate of Lieutenant Bligh and the Abdiels of the *Bounty*, as a preparation for setting off on the new tack. No one was surprised at the course pursued by the "leading journal," which, since it has become unable to lead, has generally been sufficiently dutiful in its efforts to follow. A little more astonishment may have been excited by the evolutions of a professedly Tory paper which appears to be aspiring to the position of an independent one, and which, after doing the late Government all the harm it could in reference to the Water Bill just before the elections, and giving them not the warmest of support during the contest, appears to have discovered in Mr. Gladstone a Heaven-born Minister at last, and has accordingly been saluted by Sir William Harcourt as the national organ of Conservatism. Changes of this kind, though not usual or well-famed in English journalism, are not unknown. It was reserved for the proprietors and managers of the *Pall Mall Gazette* to provide the curious spectacle of a newspaper office changing its occupants, like one of the houses in Downing Street, with a change of Government.

The first step in the drama, at least as it was openly played, was the announcement in the *Pall Mall Gazette* itself of last Saturday that the editor who had so long directed it would from that day forward have nothing to do with it. This was followed by a circular announcing a change not only of editorship, but of proprietorship, and by a statement in a Sunday paper that the *Pall Mall* would henceforward be a "Ministerial journal." The term "Ministerial journal" has never been a popular one in England, and it was not surprising that it should be repudiated. The statement was contradicted energetically by the new editor or proprietor, or proprietor-editor of the *Pall Mall Gazette*, and it was announced in the first issue of the new paper—for it certainly seems to deserve that adjective—that the *Pall Mall* would continue to be distinguished by the independence it had always shown. Meanwhile a curious explanation of this claim to continuity, and a still more curious definition of the independence referred to, appeared in a letter from the outgoing editor himself. According to Mr. Greenwood, the proprietor of the *Pall Mall Gazette*, shortly after the elections, informed him that he had transferred the property. The new holder expressed his wish that Mr. Greenwood should retain his post. This polite wish naturally elicited a request to be informed whether the principles of the paper were to be the same as before, or whether, like those of the American candidate on a celebrated occasion, they were to be changed. It soon appeared that the latter was to be the case. The principles were to be the principles of the new proprietor; and, further, the principles of the new proprietor were to be those of the new Administration, which, as Mr. Greenwood rather wickedly adds, was not then formed. However this might be, a "general support" was to be given to this Administration which was yet in the loins of its not yet known father, and it soon appeared (we still quote Mr. Greenwood) that in this instance general and particular were more nearly allied than is sometimes the case. Mr. Greenwood not unnaturally felt some reluctance to accept *en bloc* the political creed of another person, who in his turn was apparently prepared to accept *en bloc* the political creed of a yet unformed body; and he proposed some test questions. These, according to his own account, had reference to the extension of the county franchise, the foreign policy of Mr. Gladstone, and the disestablishment of the Church, all three of which were to be supported, or rather the first two were to be supported and the last not opposed. Thereupon Mr. Greenwood gratefully declined to continue as editor with such a remarkable breach of continuity, and announced his own retirement and that of his staff. With the rest of his letter we have nothing to do, as it concerns more or less private matter. Finally, this curious correspondence was enriched by two notes, one from the late and one from the present proprietor of the *Pall Mall Gazette*, demurring to Mr. Greenwood's statement of the case. The former simply says that many of the late editor's statements are inaccurate or misleading; but as these probably concern the points about which we have been silent, there is no need to take account of them. The actual proprietor's testimony as to the singular interview just detailed is of more importance. He simply states that there are "inaccuracies of fact or of colour" in the history thereof, and we can very readily believe that there never yet was an interview of such a kind in which the version of one of the parties did not seem to the other inaccurate in colour, if not in fact. In

particular it is objected that the disestablishment of the English Church was not mentioned. It does not require a Bentley or a Porson to adjust these two various readings. Nothing is more probable than that one speaker had disestablishment in Scotland in his mind, while the other was thinking of disestablishment in England; but it may be taken for granted that, if Mr. Greenwood's memory had deceived him in reference to the proposed "general support" to the new, and then non-existent, Administration, the world would have been informed of it. It may be taken, then, as agreed that immediately after the elections the powers that were and the powers that are in the case of the *Pall Mall Gazette* determined to make that periodical tack in a very remarkable manner. After all, however, tacking is not the most appropriate metaphor; for the object of the tacks, even when the ship is apparently proceeding in the most opposite direction, is the same. There used to be a joke against Monk, Duke of Albemarle, that, more accustomed to cavalry than to sailors, he never could get out of the habit of giving the order "wheel" instead of "tack." The phraseology of George the Kingmaker is very appropriate in this case, and it may be said that the *Pall Mall Gazette* has wheeled round the compass, or pretty nearly so.

We do not know that, whatever the circumstances, we can wholly approve the dragging of names and persons before the public in questions of journalism. The more strictly the anonymity and impersonality of a journal are maintained, the greater is likely to be the journalist's respect for the public and the public's respect for the journalist. But certainly if ever there was a case in which such a proceeding is excusable, that case is the present. It has at any rate for very many years been an honourable tradition of English newspaper writing that it has principles. The alacrity with which the new proprietor of the *Pall Mall Gazette* repudiated the epithet of Ministerial is the best possible proof of this, though under the circumstances it was a rather unfortunate alacrity. It would be absurd of course to suppose that a newspaper can be carried on without capital, and equally absurd to suppose that a capitalist, if he happens to have any particular principles, will lend his money for the purpose of overthrowing or attacking those principles. Papers have changed hands and, in changing hands, have changed politics before now. But we certainly do not remember any instance where so unlucky an occasion has been chosen for the change, or where the circumstances of it have been so mirth-provoking. A newspaper has been carried on for a considerable number of years on a certain plan and under a certain inspiration, which must be presumed to have been agreeable, or at least not disagreeable, to the proprietor. A general election, and the temporary lapse into disfavour of the doctrines to which the newspaper in question has given a general support, is chosen as the time for a family compact, in virtue of which it is announced to the conductors of the paper that they are to give a general support to exactly the opposite views, or rather to some possible exponents of those opposite views who have not yet declared a policy, nor indeed been placed in a position to do so. After which the journal under its new management is made to state that its former independence will be maintained, even as the famed silk stockings of Sir John Cutler, after receiving the last completing darn of woollen, might have announced that their former silkiness would continue to be an unalterable characteristic of their composition. The practical results of the proceeding do not concern us, though they must be sufficiently obvious. We have only to renew the suggestion already hinted at, that, if this sort of thing is to become common, we had better have professed Ministerial journals, so that changes may be accomplished with decency and despatch, and at the same time without unnecessary exacerbation of feeling. It might be advisable to have more than one such journal. There might be the out-and-out Ministerial paper which fought tooth and nail for everything the Government did; the semi-official journal—a sort of *Times* in its better days—which had plenty of information, and was enabled to lead public opinion up to the required point; and the independent—such as we take the new *Pall Mall* to be—which bore the outward garb of impartial criticism, but which was well understood to give what we find ought to be called a "general support" to the Ministry. A few journalists of sufficient versatility might have permanent posts on these, not to mention that the merely mechanical part of the papers and their non-political columns would also employ a considerable permanent staff. The political writers who happened to be bothered with consciences would of course go out of office with their chiefs. Indeed we do not see why a companion set of Opposition organs should not be set up—the irreconcilable organ, the moderately depreciatory organ, and the unkindly-impartial organ—in which case there would be a flux and reflux of *personnel*, just as there is between the Treasury and Opposition benches in the House. The plan might perhaps be a little troublesome to the subscribers, who would have frequently to change their orders to their newsagents, but otherwise it would have many advantages, and above all would present a perfectly irreproachable front to the critic of morals. The present system of private enterprise is obviously from this incident liable to the charge of occasionally producing scandals. The profane public will probably ask whether the late proprietor of the *Pall Mall Gazette* has another son-in-law, to whom, in case of a Tory majority, say in 1884, he can retransfer the paper in order that it may give an enlightened and independent support to the Ministers who succeed Her Majesty's present advisers. Indeed it would evidently be well for all newspaper proprietors on the new system to have two sleeping partners, one Tory and one Liberal, who might be respectively called from their sleep to become the Mr. Jorkins of the occasion when a political crisis happened, and who could talk about the continuance of their independent course, and assure all and sundry that the paper in all important matters was the same concern.

THE PARLIAMENTARY OATH.

MR. BRADLAUGH has made what we suppose he considers an effective entry into the House of Commons. By a bold avowal of his peculiar tenets and by adopting the position that those tenets constitute no obstacle to his taking his seat, he has obtained for himself the honour of a short debate and the appointment of a Select Committee. We do not wish to question the sincerity of Mr. Bradlaugh's views, but a very large number of people regarded his election for Northampton as a national calamity, if not a national disgrace, and these persons, and perhaps others, will probably suspect Mr. Bradlaugh of posing as the superintelligent unbeliever who has shaken himself free from the trammels of popular superstition. But, whether his attitude towards the ordinarily accepted religious ideas of his fellow-countrymen be real or assumed, it behoves every one who adopts such a position of superiority to make sure of his ground; and it would be no small triumph to the despised and inferior crowd if it turned out that on this occasion vaulting ambition had "o'erleaped itself," and that Mr. Bradlaugh, by his "take away that bauble" sort of performance on Monday last had practically excluded himself from ever taking his seat, save through the possible concession of both Houses and the passing of a special Act of Parliament. Mr. Bradlaugh has already been the cause of one Act of Parliament being passed; but in that case there was more reason for such a course being pursued than can perhaps be shown in the present instance. Mr. Bradlaugh has before now shown himself an acute amateur lawyer; but he has on this occasion, we venture to think, got a little out of his depth, and there is possibly in store for him an unexpected check, for which his only consolation would be the consciousness of being a martyr to his opinions.

Mr. Bradlaugh, when called upon last Monday to take the usual Parliamentary oath, claimed the right to make an affirmation in lieu thereof, asserting that he was by the statutes relating to this point entitled to take such a course. In order rightly to estimate the validity of this claim, it is necessary briefly to review the course of legislation in relation to Parliamentary oaths. At no very distant date a variety of oaths were imposed on all members except Quakers, whose claim to exemption by virtue of divers old statutes, allowing them to affirm instead of swearing, was upheld in the case of Mr. Pease, elected in 1833. These oaths included those of allegiance, of supremacy, and of renunciation of the Pretender, and one at least involved the use of the words "upon the true faith of a Christian." The election of Baron Rothschild and of Mr. Alderman Salomons, and their refusal to adopt these words—which, when the matter came before the courts of law, were held to be an essential part of the oath—showed that, unless some modification either of the oath itself or of the law which exacted the taking of it was adopted, no Jewish subject of Her Majesty could ever sit in either House. For nearly eleven years Bills having this object were annually passed in the House of Commons and thrown out by the Lords; but at length, in 1858, two Acts were passed, the first of which substituted for the then existing oaths one embodying all their necessary provisions, but still concluding with the obnoxious words, "And I make this declaration upon the true faith of a Christian. So help me God." The second Act enabled either House to pass a resolution in the case of any person of the Jewish religion entitled, but for the oath, to sit and vote in such House, that he may omit the clause "And I make this declaration upon the true faith of a Christian," and enacted that thereupon the oath so taken should be of the same effect as if nothing had been omitted. By the former of these two Acts concessions were also made to suit the case of Quakers and "every other person now by law permitted to make his solemn affirmation or declaration instead of taking an oath." In 1866 these enactments were repealed, and a form of oath imposed on members of both Houses which could be taken by Jew and Gentile alike, inasmuch as it contained no mention of Christianity and merely concluded with the customary adjuration "So help me God." Section 4 of this Act comprises an exemption in favour of "Quakers and every other person for the time being by law permitted to make a solemn affirmation or declaration instead of taking an oath," who are to be allowed to make a solemn affirmation to the same effect as the Parliamentary oath. Then by Section 5 it is provided that if any member of the House of Peers votes by himself or his proxy in the House of Peers, or sits as a Peer during any debate in the said House, without having taken the oath, he shall for every such offence be subject to a penalty of 500*l.*; and if any member of the House of Commons votes as such in that House, or sits during any debate after the Speaker has been chosen without having taken the oath, he shall be subject to the same penalty for each offence, and in addition to the penalty his seat shall be vacated in the same manner as if he were dead. An Act of 1867 substitutes the present form of Parliamentary oath for that directed by the last mentioned Act, but does not otherwise affect the law. To sum up this part of our argument, it appears that any member of either House who takes any part in the business of such House without taking the prescribed oath, or, being a person

for the time being by law permitted to take a solemn affirmation or declaration instead of an oath, having made such affirmation or declaration to the same effect, is liable to a penalty of 500*l.* for every such offence, and, if a member of the Lower House, to lose his seat in addition. The taking such oath or making such declaration is therefore an indispensable preliminary to Parliamentary life.

We now turn to the other branch of the case. Mr. Bradlaugh declines to take the usual oath, and indeed we cannot see how he could consistently do so. We do not profess an intimate acquaintance with Mr. Bradlaugh's religious or non-religious views, but in a reported case in which he was plaintiff, and in which his evidence was objected to on the ground that by reason of his peculiar tenets he was not competent to be sworn, Mr. Bradlaugh admitted that he did not believe in the Deity or in a future state of rewards and punishments. He is thus incompetent to give evidence on oath in any court of law; but were he willing to take the requisite Parliamentary oath, we do not clearly see whose business it would be to object to his competency. Even had he insisted on omitting the concluding adjuration from feelings similar to those which in M. Sardou's *Rabagas* prompted the imposition of a fine on the use of a certain name, and had so taken the oath, he might probably have safely taken his seat, inasmuch as it has been held that the concluding adjuration is merely the form of the oath and not an essential part thereof. All such compromises, however, Mr. Bradlaugh disavows, and claims to make his affirmation. But, to be entitled to adopt this alternative, he must bring himself within the definition of a "person for the time being by law permitted to make a solemn affirmation or declaration instead of taking an oath." The statutes under which Mr. Pease claimed and secured exemption as a Quaker applied only to specific oaths, and in the year in which he entered the House an Act was passed by which Quakers and Moravians were, in all cases where an oath was requisite, permitted to make a solemn affirmation instead. In the same year the privilege of affirming, instead of swearing, on all lawful occasions was extended to members of the sect called Separatists; and in 1837 an equally wide exemption was conferred on ex-Quakers and ex-Moravians who still retained a conscientious objection to swearing. This completes the list of persons who are now by law permitted to make an affirmation, instead of taking an oath, on all occasions where an oath is otherwise indispensable, and it is obvious that Mr. Bradlaugh does not come within the catalogue. But for certain specified purposes and on certain specified occasions the privilege of affirming, instead of swearing, may be extended to persons of tender conscience outside the limits of these particular sects. By the Common Law Procedure Act, 1854, it is provided that, "If any person called as a witness, or desiring to make an affidavit or deposition, shall refuse or be unwilling from alleged conscientious motives to be sworn, it shall be lawful for the court or judge . . . . upon being satisfied of the sincerity of such objection, to permit such person, instead of being sworn, to make his or her solemn declaration or affirmation in the words following:—'I, A. B., do solemnly, sincerely, and truly affirm and declare that the taking of any oath is, according to my religious belief, unlawful, and I do also solemnly, sincerely, and truly affirm and declare,'" &c.

But here of course comes in the question whether a person who would be allowed in a court of law to make an affirmation by virtue of this section is "a person for the time being by law permitted to make a solemn affirmation or declaration instead of taking an oath," within the meaning of the Act of 1866. We very much doubt whether he is. The section refers to no particular class of persons, the occasion is limited to courts of law or legal proceedings, and moreover there is no direct permission by law, but only a right of permission vested in the absolute discretion of the judge. But even supposing that any person who might reasonably claim exemption from the judge under this section is within the provisions of the Act of 1866, it does not follow that Mr. Bradlaugh is. If Mr. Bradlaugh were ultimately to be allowed to make an affirmation, he would not, according to the prescribed form in use in Parliament, have specifically to declare that "the taking of any oath is, according to hi religious belief, unlawful"; but in ascertaining who are th persons entitled to take the benefit of this section, the form of the affirmation therein provided cannot be left out of consideration. It is, we maintain, clear that the persons within the purview of this section are such, and such only, as can satisfy the Court that from conscientious religious belief they hold the taking of an oath to be morally wrong, as being prohibited by the form of religion they profess, and these are the only persons, besides the members and ex-members of the sects above mentioned, now permitted to make an affirmation instead of an oath even in a court of law. Then, is Mr. Bradlaugh within this category? There can be but one answer to this question. The very idea of an oath being unlawful according to a man's religious belief argues the existence of a Supreme Being whose name is not to be invoked in mundane matters, or who has prohibited the taking of an oath. As Mr. Justice Stephen observes in his *General View of the Criminal Law of England*, these Acts do not meet the case of a person who, being an atheist, has either no religious belief, or does not object to taking an oath.

Apparently, however, Mr. Bradlaugh relies on the provisions of two other Acts, to which he referred in his short address to the House, but which do not, in our opinion, help him much. These are the "Evidence Further Amendment Act, 1869," and the "Evidence Amendment Act, 1870." The object of these Acts was as follows:—It being found that in certain cases the ends of justice were defeated or hindered by witnesses objecting to take an oath, or being objected to as being incompetent to do so, who, by reason of the absence of any religious belief whatever, could not be permitted to affirm, the Act of 1869 was passed, providing that in such cases "such person shall, if the presiding judge is satisfied that the taking of an oath would have no binding effect on his conscience, make the following promise and declaration":—"I solemnly promise and declare that the evidence given by me to the Court shall be the truth, the whole truth, and nothing but the truth," and any person having so pledged himself and subsequently giving false evidence is liable to the penalties of perjury.

In 1870 Mr. Bradlaugh brought an action against one De Rin, which was referred to arbitration. As before stated, Mr. Bradlaugh presented himself as a witness, and was objected to on the ground of incompetency by reason of his peculiar tenets. He then claimed to give his evidence by virtue of the Act of 1869, but the arbitrator held that that Act did not apply to proceedings before an arbitrator, and rejected his evidence. Mr. Bradlaugh applied to the Court, but the Court refused the application on the ground that where persons have agreed on an arbitrator they are bound by his decision, and did not decide the point at all. In the same year the Act of 1870 was passed, extending the powers of the Act of 1869 to all proceedings before a person authorized to administer an oath, but not otherwise affecting the law. It is to these statutes Mr. Bradlaugh appeals as constituting him a person for the time being by law permitted to make a solemn affirmation or declaration in place of taking an oath within the Act of 1866. There is, of course, something to be said on his side. Under the Acts of 1869 and 1870, a witness may object to take an oath, and may eventually "solemnly promise and declare," and it may fairly be argued that this amounts to being permitted to make a solemn affirmation or declaration instead of taking an oath, especially in the case of a plaintiff or defendant, who would lose the benefit of his own evidence were it not for some such provision. But the arguments on the other side appear to us far more cogent. The remarks made above with reference to the Common Law Procedure Act apply with equal force to these Acts. Next, the Act of 1866 specifies "Quakers and all other persons for the time being permitted, &c.," and on an established rule of Parliamentary construction, the subsequent general words must be interpreted as being *ejusdem generis* with the preceding specific ones. The application of this principle would limit the words "all other persons" to persons having a conscientious religious objection to taking an oath—the class of people, in fact, provided for by the Common Law Procedure Act. Then the words of the Act of 1866 are "a solemn declaration or affirmation." If these words be taken as describing the same thing, it is clear that the declaration or promise prescribed by the Act of 1869 is not a solemn affirmation, though it may be a declaration, if they be taken disjunctively as referring to two different things. Again, there does not seem to be much "permission" about the terms of the Act of 1869. The Act seems to contemplate witnesses who are not parties to the suit rather than the parties themselves, and without affording any countenance to their absence of religion, to have sought to devise some means of rendering their testimony available by applying the purely secular sanction of a possible prosecution for perjury. "Such person shall . . . make the following promise and declaration." The point is, however, unquestionably a knotty one, and we shall be curious to see what the Select Committee determine about it.

THE HERALD OF PEACE.

THE blessing pronounced on peacemakers is not likely to be inherited by newspapers. The popular opinion that the conductors of newspapers like war, because war helps to sell their journals, is probably erroneous. War is bad for trade, and anything that is bad for trade is bad for the press. But, on the whole, out of the mere desire to find something exciting to say, newspapers do sometimes happen to encourage war. There may be some slight ill-feeling between two countries or Courts, and the papers are bound to drag the affair into publicity. They are like the boys whom Arminius and Mr. Matthew Arnold saw at Eton. Young Bottles was asked whether he would take a licking from Lord Claude, and then Lord Claude was informed that "that beast Bottles says he won't take a licking from you." Newspaper correspondents are constantly averring that France won't take a licking from Germany, or that she has taken a diplomatic licking, or that Italy does not want to fight, but will do so in certain contingencies. Thus the discussion of foreign politics in the press is very like the gossip of small boys in the Lower Fourth, who pass their time in wondering whether Briggs major is afraid of Smith, and whether Thompson is the master of Jones. The eternal chatter about these matters rouses angry passions, and presently there is work enough for war correspondents.

There is, happily, one small but persevering journal, little studied, we fear, in those homes of iniquity, "the Clubs," which raises its little voice against militarism. This is *The Herald of Peace*, the organ of the Peace Society, which most outsiders probably supposed to have died long ago of hope deferred. But the Peace Society is really in a green old age, and celebrates its sixty-fourth birthday on the 18th of this month in Finsbury Chapel. On

that occasion four members of Parliament—Mr. Firth, Mr. Illingworth, Mr. Arthur Pease, and Mr. Henry Richard—will address the pacific. While we wait anxiously for their remarks as to the effect of the late elections on the peace of Europe, the *Herald*, published under their auspices, may help to pass the time. This curious little journal contains in small space a great number of articles. The first deals with the decadence of Germany, where "the slightest (military) offence involves imprisonment in a dark cell on bread and water. In special cases the cell is lined with hard and sharp wooden laths, placed edgeways in all directions, so that the prisoner can neither stand, lean, or lie down in comfort." We should think not, indeed. "This amounts to actual torture; and it is a punishment which has been inflicted, for example, on several young men who at intervals have refused, on conscientious grounds, to serve in the army." But shall Germans be alone in refusing, on conscientious grounds, to serve in the army? Is their virtue and their martyrdom unknown among British privates? No; we are proud to learn from the *Herald of Peace* that there are some brave and consistent soldiers under our own flag who are "reluctant to destroy human life." "During the Zulu war," we are informed, "some British soldiers, who were reluctant to destroy human life, and consequently held back, were, according to newspaper reports, flogged into the fight." Any thinker less guileless than the editor of the *Herald of Peace* might suspect that the British soldiers were reluctant to give the poor untutored Zulu a chance of breaking the Sixth Commandment. The *Herald* does not seem to see that these mildest of men need never have joined a brutal and barbarous profession at all, and the scorn of the *Herald* is reserved, not for the poltroons, but for the men who flogged them. Prose is not equal to the situation, and the journal of peace breaks into verse which is well worth quoting:—

> Blush, blush, ye sires of England,
> Where streams the Gospel light,
> That your own sons and soldiers
> Are flogged into the fight!
> Flogged till their backs are bleeding,
> Flogged till their hearts are sore,
> Flogged till their manhood droopeth,
> To lift itself no more!
>
> Blush, blush, ye English daughters,
> For brothers on the field,
> Whose tortured backs are bleeding
> From whips which warriors wield!
> Blush! blush! and let your sighing
> Be heard from shore to shore,
> Till legislators tremble,
> And use the lash no more.
>
> Blush, blush, ye English mothers,
> With ditties on your lip,
> And pray that laughing baby
> May never feel the whip;—
> May never feel the scourging,
> The cruel "nine-tails'" bite,
> Nor by his brother warriors
> Be flogged into the fight!
>
> And O thou Queen of England,
> To Christian duty bound,
> Let not the crime of flogging
> Within thy realms be found.
> 'Tis not for those who gather
> Beneath the Sharon Rose
> To tread upon their brother,
> Or fill his life with woes.

We need scarcely apologize for the length of this quotation. Apart from the *verve* and spirit of the verse, the poem proves that the friends of peace have quite novel ideas about honour and shame. Ordinary people, the English mother "with ditties on her lip," and generally those who "gather beneath the Sharon Rose," would blush if it were true that the British soldier needs to be flogged to the front. But the *Herald of Peace* glories in the coward, and is only ashamed of the people who award him his proper punishment. To be fair, the *Herald* should admit that we are as bad as the Germans, who torture the conscientious conscript, while we flog the reluctant warrior.

Few students of contemporary thought can be ignorant of the great name of the Reverend Joseph Cook (of Boston, U.S.) Mr. Cook is that great American voice which denounces Professor Huxley with all his works. He is the profound scholar, too, who derives *Bathybius* "from two Greek words meaning respectively 'deep' and 'sea.'" Mr. Cook has lately been lecturing on universal peace, and has even devised a practical plan by which the quiet of the world is to be secured. The *Herald of Peace* prints his orations; and we do not mean to flatter Mr. Cook when we say that, compared with the other contents of the *Herald*, his address is quite sensible and coherent. He advocates the formation of a great English-speaking league. This alliance will be powerful enough to whip all creation into peace and brotherhood. "The disbanding of large standing armies among English-speaking peoples would be one majestic end attainable by this majestic means." As Great Britain is the only English-speaking nation which possesses what, by a stretch of courtesy, may be called a standing army, we have only to lay down the sword and "strike a universal peace through half the continents and all the seas." Unluckily Europe would belong to the unpacified half of the continents. Thus it seems probable that the great Anglo-Saxon League must do its striking first, and lay down its sword afterwards. Can this prospect really charm the Peace Society? Mr. Cook says, "Even so Conservative a power as the London *Spectator* observes that such an alliance would be utterly beyond attack from any first-class Power, unless China should ever become one; and, except in India, could only be attacked by fleets which eighty millions of men, always foremost in naval warfare or maritime adventure, could, with no great or exhausting effort, brush away from the seas." But how, we may ask Mr. Cook and our Conservative contemporary the London *Spectator*, how are we to keep eighty millions of men always in warlike training? If they are kept in training the League will be eighty times worse off than Germany, and if they are not kept in training, even China, with thunders from her native junk, will quell the British foe. In fact, though the *Herald of Peace* does not seem to see it, even Mr. Cook is aware that to secure peace we must be ready for war. "Germany," says he, "although not given to making war, is given to such preparations for war as make peace advisable to all her neighbours." It is a pity that these preparations include cells lined with sharp wooden laths placed edgeways in all directions. But, if the Peace Society were capable of discourse of reason, its own journal would teach it either to give up hoping *pacis imponere morem*, or to give up denouncing military preparations as wicked. Unhappily, not even experience will teach people who piously shut their eyes to the facts of human nature. The founder of the Krupp family only employed ten workmen in 1810. His descendants, in one of their establishments alone, employ 8,500 men, and daily consume 18,000 tons of coal, while they annually work up 200,000 tons of iron. It is only too obvious that no country nor set of countries can afford to disarm while the customers of Messrs. Krupp enable them to do this lively business. The Peace Society trots after its own arguments, round the same old vicious circle, and is not aware that the conclusion is as remote as it was sixty-four years ago. Meanwhile the Workmen's Peace Association is not unhappy. "It has resolved to bring all the influence of the Association to bear on Mr. Richard's International Disarmament Motion, and the council expressed the hope that the Right Hon. W. E. Gladstone would lend his powerful aid to the motion when it came to be submitted to the House of Commons." But even the most sanguine enemies of Mr. Gladstone can hardly believe that he will fulfil the expectations of the Workmen's Peace Association, or dally with the logic of the *Herald of Peace*.

THE MONEY MARKET.

THERE are two periods of the year at which, to use the language of bankers, money is dearer than usual—that is to say, at which the rates charged in the short-loan market for the use of capital are higher than at other times. The phenomenon is not confined to our own country; it is observable in every commercial community, and arises necessarily from the influence of the seasons on the course of industry, though special legislation accentuates it in certain cases. The periods at which this "hardening of rates," again to borrow the phraseology of Lombard Street, takes place, are May and November. It is, however, most pronounced in the latter month. The harvests have then been got in, and farmers are anxious to sell the proceeds as soon as possible. They would naturally refuse to take cheques from buyers, many of whom they have probably never seen before and know nothing of. And even if they were willing to trust purchasers, there are not a few of them who keep no banking account. Buyers, therefore, have to provide themselves for the nonce with coin or notes in unusual quantities, and in doing so they diminish the stock of cash at the great trade centres. The transportation of the purchases thus made gives employment to a further amount of currency. As this kind of thing is going on at nearly the same time in all civilized countries, there is a less amount than ordinary of loanable capital available for merchants and speculators, and rates inevitably tend upwards. In May there is not this demand for money "to move the crops," as the Americans express it, but the spring agricultural operations are in their most active stage. There are additional labourers to be paid, there are the sheep and the stall-fed cattle fattened during the winter to be disposed of, there are the young stock to be bought in for the pastures. In Scotland, moreover May is one of the half-yearly terms at which hirings are entered into and various payments made. And in Ireland the two "gale days," as they are called, on which rents fall due, are the 1st of May and the 1st of November. In consequence there is always in May a considerable increase of the country note circulation; and as the note circulation cannot be increased beyond the authorized issue fixed by the Acts of 1844 and 1845 without an equal increase of the gold held by the issuing banks, this addition to the country note circulation involves the withdrawal of an equivalent amount of gold from London, where the ultimate reserve of the whole United Kingdom is kept. After a while the money paid away for rent or in the purchase of cattle is returned to the banks, and the gold is sent back to London, in many cases without ever having been removed from the boxes in which it was despatched. But in the meanwhile Lombard Street is the poorer, and consequently those who have to borrow or to discount bills find the rates raised against them. What we have been describing is going on as usual at this moment. During the Stock Exchange settlement last week, when the demand for accommodation was swollen by those who had bought securities and were not prepared to pay for them, very

large amounts were borrowed from the Bank of England at 3 per cent. and over, and the discount rates also reached the Bank minimum. In the early part of this week the demand was not so great, yet the terms on which the Treasury bills were placed on Tuesday show how much tighter is the market than it was lately. It is not necessary to insist in this place upon the fact that the credit of the British Government ought to be higher than that of any trading house, however high the latter may stand. Treasury bills, too, have this superiority over others, that they are actively competed for by foreigners who would not look at trade or even bank paper. At the present moment, moreover, there is a general expectation that the floating debt will be speedily reduced, and that consequently the supply of Treasury bills will be greatly decreased; and there is for that reason an increased desire to secure those still on offer. Yet the Treasury has had to allow a discount of more than 2⅝ per cent. This exhibits the tendency of the market, and it also confirms the view we have often maintained as to the injury to the credit of the country produced by a large floating debt.

This periodical cause of a dearer money market is in its very nature temporary. It recurs at the same season every year, and ceases to operate in the course of a few weeks. It is now well understood, and as it does not take money out of the country, it does not affect the imagination of Lombard Street, and tends to have less effect than it had of old. There is consequently nothing in it to produce really dear money. Nor is there anything in the other influences acting immediately upon the market. The statistics of the London Bankers' Clearing House for the year ending a week ago, issued on Monday by Sir J. Lubbock, exhibit, indeed, a very great increase of transactions over the preceding twelve months and over every year since 1875-6. Even allowing for the very large part played by speculation, more especially on the Stock Exchange, there is still a marked expansion of legitimate business. In due course this expansion, bringing after it better employment, higher prices, and higher wages, would necessitate a more and more enlarged currency, and thus make money scarce. But this process in any event would take time; and now, as we pointed out last week, there is a check to the improvement. Prices have fallen heavily, and the volume of transactions has shrunk. Trade, it is true, is still much better than it was twelve months ago. But the improvement is now so slow that, unless greatly accelerated, it will not for a long time have any effect upon the money market. Further, the foreign exchanges are not unfavourable to this country; more particularly the New York money market, from which most disturbance was to be apprehended, at length shows symptoms of ease. Lastly, the political prospect on the Continent, which a little while ago appeared so threatening, is now less alarming. The outbreak of a great war, though in the long run it would send capital here for safety, and thus tend to keep down rates, would at first cause a panic on every Bourse in Europe, and so make money dear. But, although it would be very hazardous to commit oneself to a political prediction, it may at least be said that for the present there is no such cause of uneasiness as there was while the German Army Bill was before the Reichstag. But for one circumstance, then, it might be said that the influences acting upon the money market, though for the moment tending towards higher rates, yet favour in the near future greater cheapness and a more abundant supply. The one circumstance to which we refer is the growing scarcity of gold.

We have discussed this subject so often and so fully, that we need not enter into much detail respecting it here; yet it is requisite to touch upon it briefly in order clearly to bring out its bearing upon the money market. During the past nine years Germany, which had previously been a silver-using country, bought up for her new gold coinage, in round numbers, 84 millions sterling, being at the rate of over 9 millions per annum, drawing for the purpose chiefly upon London. Just when the disturbance due to these enormous purchases was abating, the United States began to prepare for the resumption of specie payments, and, in doing so, absorbed the entire production of their own mines. Last year, in addition to the yield of the home mines, they took from England and France over 16 millions sterling in gold, and up to the present time have not returned a penny of the amount. Meanwhile, the productiveness of the Australian mines has greatly declined, and as the Ural mines barely suffice for the supply of Russia and Germany, all the rest of the world is limited to the yield of Australia and miscellaneous sources, amounting altogether to about seven millions per annum. The final result thus is that the gold-using countries, excepting the United States, Germany, and Russia, are dependent for all their requirements upon seven millions a year, subject to the competition every now and then of the three nations just named. And in the case of the United States last autumn this competition was so intense that it took in a few months some sixteen milions, or over two years' production of Australia and the miscellaneous sources. In other words, the United States have lately taken three years' production of their own mines and two years of the supply available for all other gold-using countries, with the exception of Russia and Germany. Of course they have been able to do this only by drawing upon the stores of the great European banks, and accordingly we find a diminution of these stores. Twelve months ago the bullion in the Bank of England amounted to 33,700,000*l.*; last week it was only 28,100,000*l.*—a decrease of over 5½ millions. The Bank of France did not begin to distinguish in its returns between the amounts of gold and of silver held until the alarm created by the drain to New York last autumn compelled it to do so; but we know from the statistics issued at intervals that for years it has been losing gold and accumulating silver, until last week it held altogether only 32,700,000*l.* in gold, of which barely 17,309,000*l.* was in the head office in Paris. This latter amount, it is obvious, can alone be safely regarded as a metallic reserve, since we may be sure that the Bank would not keep at its branches more gold than is required for their current business. The Imperial Bank of Germany, on the other hand, has gained during the twelve months about a million sterling. But the figures just given do not represent the real loss of gold. Thus the Bank of England held at the end of July last 35,900,000*l.*, and at Christmas only 27,400,000*l.*, showing a loss in the interval of 8½ millions; this was to the United States chiefly. The drain thither stopped then, and the gold in the Bank increased to 29 millions in the middle of March, from which it has again fallen to 28,100,000*l.* Nor is this all. In the first four months of the current year the exports of gold exceeded the imports by 1,300,000*l.*, yet the gold held by the Bank of England at the end of April exceeded the amount at the beginning of the year by 500,000*l.* In the four months, therefore, the gold withdrawn from the circulation of the country must have amounted to almost 1,800,000*l.* Consequently not only has the Bank lost gold as shown above, but also the internal circulation has shrunk very considerably. Under these circumstances it is evident that, if trade improves, the value of money may be expected to rise, and possibly it may rise very sharply, if there should be in the autumn a considerable drain to New York.

THE PICTURE GALLERIES.—II.

A SECOND visit to the Grosvenor Gallery confirms, if any confirmation were needed, the opinion formed as to the striking merit of M. Bastien-Lepage's work. The force, the delicacy, the technical skill, and, it may be added, the variety displayed by the young painter are alike remarkable. In the West Gallery he exhibits a large landscape which has been seen before in the Salon at Paris, and which is called "Les Foins" (7). One obvious quality of this picture is its straightforwardness, its representation of what the painter saw without any attempt to dress it up into what may be called conventional picturesqueness. The foreground is occupied by the figure of a peasant girl, who is undeniably ugly, and in whose portrayal no attempt at artificial prettiness or refinement has been made. Yet there is a strange impressiveness in both face and figure, which accord well with the sense of open-air freedom that belongs to the whole picture. The recumbent figure of the man who is asleep is open to fault-finding in the matter of drawing, and objections may be made to particular points in the landscape. But the whole effect of the work is both bold and attractive. Immediately below it hangs a portrait by the same painter of Mlle. Sarah Bernhardt (9); the extraordinary delicacy, truth, and finish of which are as remarkable as the freedom and vigour of the landscape just referred to. The flesh-tones and the painting of the dress and hair are admirable; and the pose is at once novel and natural. It is interesting to compare these and two portraits from M. Bastien-Lepage's hand (10, 11) with "The Annunciation to the Shepherds" (21), an early work of his, in which one sees the same tendencies which are apparent in "Les Foins" curiously brought into an ideally devotional subject. M. Bastien-Lepage is also represented in the East Gallery by two admirably strong and expressive portraits, "My Parents" (141). Among other portraits in the West Gallery are Mr. W. B. Richmond's "Portrait of Charles Darwin, Esq." (40), which is painted with signal success in the spirit of the Venetian school, and in which the treatment of the red robes is specially remarkable; and "Portrait of W. Holman Hunt, Esq.," a work which is full both of refinement and vigour. M. Legros, of whose odd method we confess to being somewhat weary, sends two or three heads. The best of these is perhaps the "Portrait of F. Dixon, Esq." (12). In this we cannot but recognize an uncommon power, not only of drawing, but of seizing character. It is unfortunately contrasted with the same painter's atrocious attempt at a "Portrait of Professor Huxley" (19). Mr. Millais has two remarkable portraits of "Mrs. Caird" (54) and of "Mrs. Jopling" (49), both of which strikingly exhibit the painter's complete command of his art, and both of which are free from what has sometimes struck one as the too obtrusive dash of Mr. Millais's painting. Mr. Gregory's "Portrait of W. H. Wills, Esq." (39) seems hardly as strong as his last year's work. Mr. John Collier's "Portrait of Mrs. John Collier" (81) is perhaps the best thing which the painter has shown this year. It has solidity and strength combined with command of expression, and a feeling for colour, which is well brought out in the painting of the white dress and its contrast with the background.

Among the landscapes and figure pictures two large landscapes, "The August Moon" (20) and "The Voice of the Cuckoo" (23), by Mr. Cecil Lawson, occupy a prominent place. The general effect of the former of these is undeniably pleasing, although it is perhaps equally undeniable that the strangely enormous moon, which is supposed to cast over the scene the light which is great part of its attraction, has in itself no luminosity. The effect of "The Voice of the Cuckoo," a somewhat sickly landscape, is spoilt by the incongruous manner in which

two portrait figures are thrust, as if gummed on in an after-thought, into the foreground. The truth and force of Mr. P. R. Morris's charming moonlight landscape, which hangs between them, and which is somewhat inappropriately called "The Bridge of Sighs" (22), seem to accentuate the shortcomings of Mr. Lawson's work. Mr. Alma-Tadema has three small works (51, 52, 53), in which his admirable sense and rendering of distance are no less observable than his power in drawing and colouring. The brilliant sky effect in "A Question" (51) is especially striking. Of Mr. Watts's beautiful "Daphne" (43) we have already spoken, and we have only to add that the whole group of his pictures is well worth study, and that his power in the line of portraiture is finely exemplified by the "Portrait of William Morris, Esq." (44). Mr. Hallé's finely designed "St. George" (28) shows a gratifying and distinct improvement in the painter's command of his resources; and so does Mr. David Carr's "Watercress Gatherers" (17), which, with greater technical skill, has all the truthful and picturesque feeling which we observed in his last year's picture. Mr. H. Moore has two fine sea-pieces in his accustomed manner (72, 76). Mr. Hennessy exhibits "Evening, Calvados" (68). This strikes us as a work of unusual beauty and power. The feeling and rendering of the particular effect sought after have both truth and imagination, while the technical skill which Mr. Hennessy has often displayed is shown to special advantage. Mr. John O'Connor's "Corner of Waterloo Bridge" (59) is a pleasing instance of his power of catching an agreeable effect where many people might not expect to find it; and Mr. Weguelin's "The Vintage" (73) confirms our belief in its painter's capacity. M. Legros's large picture, "L'Incendie" (67), is, to our thinking, on the whole an unattractive work. It has the severity and the sincere, if awkwardly expressed, feeling which one might look for in the chief figures; but the fact remains that they are awkward, and that the effect of the fire's light, whether we are to regard it as a direct representation or as a suggestion, is untrue. In one way, and that a highly undesirable one, Mr. Spencer Stanhope's picture, "The Waters of Lethe" (31), is one of the most remarkable works in this Gallery. It is so difficult to find words to express the supreme absurdity of such a production that we prefer to leave spectators to make their own account of it.

However, to get over two unattractive subjects at once, Mr. Stanhope's picture in the West Gallery is more than rivalled by Mr. Walter Crane's "Truth and the Traveller" (111) in the East Gallery. This we can only describe by saying that no more hideous, improbable, and disgustful figure has ever been presented to the public than that which is supposed to pass for the ideal Truth. It is impossible to speak of such a thing as this with patience, and it is astounding that it should have come from the hand of an artist who has made so many justly popular dainty designs for children's books, and who, it is only fair to add, can produce such pleasing work as, for instance, the "Well in the Courtyard, Cucumella, Sorrento" (64), in the Grosvenor Gallery. Immediately above Mr. Crane's monstrous work hangs a strong water-piece called "Tug and Timber-Bridge" (108), by Mr. Keeley Halswelle, who, both here and at the Academy, shows this year a striking power in work of this kind. We have already expressed our admiration of Mr. Burne-Jones's large picture, "The Golden Stairs" (120), in which the artist's merits are markedly visible, while the peculiarities which have often been more or less irritating assert themselves but little. There is, as many people have remarked, no reason why a beautiful design without any purpose beyond its beauty should be called "The Golden Stairs." On the other hand it may be said that there is no reason why it should not. "I can call my hat 'Cadwallader' if I like," said the hero of Miss Edgeworth's story *The Mimic*; and those who object to Mr. Burne-Jones's nomenclature may find their answer in a like contention. Near this are Mr. Mark Fisher's admirable landscape, "The Last of Autumn" (130), and Mr. Macbeth's spirited and bold "A Flood in the Fens" (131), the truth and vigour of which are in curious and pleasing contrast to a smaller work by the same artist in the West Gallery. Above this is a very graceful picture by Mrs. Anderson, called "The Bathers" (132), and near it a very poetical and attractive picture by Mr. Boughton, "Omnia Vincit Amor" (125). Mr. Herkomer's "Portrait of Lord Stratford de Redcliffe" (140), painted for King's College, Cambridge, is a fine work. Like Mr. Richmond's portrait of Mr. Darwin, which has been referred to, and which was painted for the University of Cambridge, it bears welcome testimony to the artistic enterprise of the University. Mr. P. R. Morris's landscape with figures, "Cradled in his Calling" (142), a fisher's child carried in a net across the downs towards the sea, is a work of great strength and beauty. The simple poetry of the subject is excellently expressed, and the truth of the blending of the blue sea and sky in the distant landscape will be either felt or recognized by most spectators. Near this is Mr. Dicey's graceful picture, "Girls Arranging Flowers" (144), and, among smaller pictures in the same neighbourhood, we would direct attention to Mrs. Gosse's attractive and unconventional view of "Torcross" (147), to Lady Lindsay's charming study of a squirrel called "A Free Breakfast-table" (151), and to Miss Dorothy Tennant's touching picture, "Homeless" (156). Three important pictures in this room we have yet to notice—Mr. North's admirably painted, if uninteresting, "Grass of the Field" (100), Mr. Hennessy's very original and attractive "Spring Fantasy" (92), and Mr. A. Moore's beautiful figure "Rose-leaves" (105).

In the South Gallery, there can be little doubt that the finest work is Mr. Napier Hemy's "Saved" (171), a wonderfully true and spirited picture of a boat which has struggled successfully with the difficulties of crossing a bar. The drawing and painting of the figures, of the ships and boats, and of the water, are alike remarkable. M. de Nittis has a curiously hard and clever representation of a scene familiar to many people, "Feeding the Sparrows in the Gardens of the Tuileries" (192), and Mr. Collier sends a picture called "Coiners" (188), representing a scene in the Mint. With many merits, the picture seems deficient in the sense of heat and luminosity which the subject demands.

THE THEATRES.

MME. MODJESKA'S first appearance on the London stage, which took place on Saturday last at the Court Theatre, had been looked for with unusual interest on account of the great reputation which preceded the actress. It is to be regretted that her introduction to a London audience should have been made in so sickly, dull, and ill-constructed a play as *La Dame aux Camélias*. The play, considered as the work of a youth, is not without some kind of merit; but it seems absurd to consider a piece so riddled with faults as a serious dramatic or literary performance, and the success which it had in France was certainly not due to its intrinsic attraction. The secret of this is partly revealed, with a curious *naïveté*, by M. Jules Janin in the preface which he thought fit to write for the revised edition of the novel. In this he gives an amazingly foolish and sentimental sketch of the career of the woman who was the original of young Dumas's heroine, of which this passage may serve as a specimen:—"Elle avait poussé si loin la science du bien-être intérieur et l'adoration de soi-même, que rien ne saurait se comparer à ses habits, à son linge, aux plus petits détails de son service, car la parure de sa beauté était, à tout prendre, la plus chère et la plus charmante occupation de sa jeunesse." He then goes on to say that the book was successful when it first appeared, but its success was increased when readers began to say that the study was evidently taken from life. "Alors on s'inquiéta fort du nom de l'héroïne, de sa position dans le monde, de la fortune, de l'ornement et du bruit de ses amours. Le public, qui veut tout savoir et qui sait tout en fin de compte, apprit l'un après l'autre tous ces détails, et le livre lu, on voulait le relire, et il arriva naturellement que la vérité, étant connue, rejaillit sur l'intérêt du récit." This degraded kind of interest no longer, of course, belongs to the story in England at least; but a sort of factitious interest has been kept up in *La Dame aux Camélias* from time to time by the refusal, on moral grounds, of the Lord Chamberlain to license the performance of the play. On what grounds the present Examiner of Plays rejected the French piece when he admitted Mr. Mortimer's version of it, called *Heartsease*, in which Mme. Modjeska appears, we are entirely unable to understand. Mr. Mortimer had an impossible task to perform in retaining the situations, such as they are, of the play, and removing the objections which have kept it from the English stage. It would be ungracious to blame the adapter for the inevitable result of an attempted compromise between offended propriety and the claims of what is thought by some interesting impropriety. The veil which the writer of the English version has had to throw over this is simply ludicrous. Nothing is gained in the interest of morality, and everything is lost in the interest of such crude art as can be said to belong to the piece. We are shown a woman about whose position there is no room for doubt; and we are shown two men, both of them well born, who are anxious to marry her. With each of them, while she is engaged to be married to him, she lives alone. The pretence of disguising the real state of affairs is monstrously flimsy, and the talk about marriage which is from time to time thrust in is an outrage upon the common sense of the public. If it is accepted seriously, the whole play becomes absolutely nonsensical. If it is to be treated as a solemn piece of hypocrisy to salve the public conscience, it can only be said that the sooner the Lord Chamberlain's office abandons such mean devices the better. But, apart from any imported disadvantages, the play is at best a poor one in itself. The same situation is continually repeated through five dreary acts, and it is impossible to view the chief character as the author would wish her to be viewed. It is observable in many of M. Alexandre Dumas fils's writings that the characters whom he labels as good are in reality pitiful and offensive creatures; nor is this strange perversity or want of perception found only in such early works as *La Dame aux Camélias* or *La Vie à Vingt Ans*. That cleverly-written and unattractive play *Le Demi-Monde* ends with one of the characters saying to another, "Vous épousez le plus honnête homme que je connaisse," meaning thereby a man who has thought it a noble task to hunt down an unhappy woman who is trying to raise herself out of the dubious society of the *demi-monde* to better things. This, it may be noted, is in curious contrast to the motive of *La Dame aux Camélias*, which contains more than one heavy tirade against people who put any barriers in the way of a woman who is a member of a kind of society which, unlike the *demi-monde*, has no atom of dubiousness left about it. But in both plays there is the same blindness as to what is or is not repellent. The heroine of *La Dame aux Camélias* is, we are told, a woman of a strangely noble character in spite of her ignoble life; and this nobility she shows by, amongst other

things, taking money from a man she does not love just after she has dismissed a man whom she does love with every assurance of affection and fidelity. But it would be tedious and unnecessary to point out the many faults which act by act assert themselves in the course of this maudlin piece. From her performance of its principal character it would be rash to decide upon the extent of Mme. Modjeska's powers. That she is a highly-trained and very artistic actress, with a fine science and command of gesture, and, despite her slight foreign accent, of intonation, may be asserted. In one passage, that of a heart-broken farewell masked by a light manner, she displayed singular talent and skill, the effect of which was unhappily marred by her coming back in the middle of the scene to acknowledge the applause of the audience. Whether or not Mme. Modjeska is likely to justify the reputation which preceded her as an actress of great characters, it is impossible to tell from her very clever performance as the heroine of *La Dame aux Camélias*. Mr. Dacre, who played the odious part of Armand Duval, deserves praise for his earnestness and excellent intention, but he has everything to learn in the way of movement and gesticulation.

The revival of the late Mr. Robertson's comedy *School* at the Haymarket is an experiment less interesting perhaps than might have been hoped for—not with regard to the acting of the piece, but with regard to the play itself. This has been tersely and aptly described by a contemporary critic as a "polite farce," and indeed it amounts to little more. The types of character are not new, the actions in which they are concerned have little importance, and the dialogue, always written with good taste, is not the less curiously vapid. Mr. Robertson had no doubt some remarkable qualities as a dramatist, especially as a dramatist for the Prince of Wales's Theatre; and it may be thought in some sense a proof of his having possessed original power that *School*, the play for which he was indebted to a foreign source, is far weaker than the pieces which he wrote "out of his own head." An odd mistake in it is the dragging in at the end, by the head and shoulders, of the legend of *Cinderella*, of which we have had the very vaguest, if any, hint before, but of which the German author borrowed the title for his play. With the mounting and acting of *School*, which may retain its popularity in spite of its weakness, there is very little fault to find. Mrs. Bancroft is more charming and natural than ever as Naomi Tighe; and Miss Marion Terry is pleasing, though somewhat affected, as Bella. Mr. Bancroft is as good as ever in Jack Poyntz. Mr. Conway plays the rather colourless part of Lord Beaufoy in a pleasant and manly way. Mr. Arthur Cecil is, as might be expected, inventive and clever in the earlier appearances of the painted and made-up Beau Farintosh, and in the scene at the end where the old man has thrown off his youthful trappings, finds an occasion of exhibiting a true and unforced command of pathos which may surprise those who do not remember his performance in *To Parents and Guardians*. His attitude and look while he is listening to his nephew's story are admirable, as is his burst of rage at Krux. Mr. Forbes-Robertson's representation of Krux is curious. It is, like everything Mr. Forbes-Robertson does, carefully studied, and from the actor's point of view admirably executed. It is, to put it briefly, a strong piece of acting, which seems to be hardly in accordance with the general character of a piece which, whatever else it may be, is not strong. Mr. Kemble's Dr. Sutcliffe is a lifelike study. *School* is preceded by the comedietta or farce, *Cut off with a Shilling*, in which Mr. Brookfield's performance of Colonel Berners gives fresh proof of his undoubted talent. He has many merits, and the only fault in his performance against which we would warn him is a certain want of freedom and decision in gesture. Complete command of the actor's art is a hard thing to acquire. Mr. Brookfield's skill in other matters leaves little doubt that he will end by mastering this.

The morning performance at the Gaiety of *George Barnwell* has been succeeded by one of "Monk" Lewis's marvellously silly piece, *The Castle Spectre*. "D. G." in his "remarks" upon this play seems to have felt that he was, in defending it, holding a somewhat doubtful brief; but he actually persuaded himself to write that "its story is deeply interesting, and conducted and developed with a considerable portion of dramatic skill," and that "there is nothing even improbable in this drama but the spectre." He admits that "the language of this play is in many parts turgid and bombastic," and we might condone this in part if the play were in its essence a good melodramatic piece. Unfortunately it is from every point of view hopelessly vulgar and childish. How "turgid and bombastic" the language is may be best judged from an extract taken at hazard:—

OSMOND. No more;—I must not hear you. (*aside*) Shame! shame! that ever my soul should stoop to dissembling with my slave! (*crosses to* L.)

SAIB *enters*, L., *and advances with apprehension.*

OSMOND. How now?—why this confusion?—why do you tremble?—speak!

SAIB. My lord!—the prisoner——

OSMOND. The prisoner?—go on, go on!

SAIB. (*kneeling*) Pardon, my lord, pardon! Our prisoner has escaped.

OSMOND. Villain! (*wild with rage he draws his dagger, and rushes upon* SAIB—KENRIC *holds his arm*, R. C.)

KENRIC. Hold! hold! What would you do?

OSMOND. (*struggling*) Unhand me, or by heaven——

KENRIC. Away! away! Fly, fellow, and save yourself! *Exit* SAIB, L. (*releasing* OSMOND) Consider, my lord—haply 'twas not by his keeper's fault that——

OSMOND. (*furiously*) What is't to me by whose? Is not my rival fled? Soon will Northumberland's guards encircle my walls, and force from me—Yet that by heaven they shall not! No! rather than resign her, my own hand shall give this castle a prey to flames; then, plunging with Angela into the blazing gulf, I'll leave these ruins to tell posterity how desperate was my love, and how dreadful my revenge! (*crosses* R. *stops and turns to* KENRIC) And you, who dared to rush between me and my resentment—you, who could so well succeed in saving others—now look to yourself.

Exit, R.

KENRIC. Ha! that look—that threat. Yet he seemed so kind—so grateful! He smiled too! Oh! there is ever danger when a villain smiles.

SAIB *enters softly*, L., *looking round him with caution.*

SAIB. (*in a low voice*) Hist! Kenric!

KENRIC. (R.) How now? What brings——

SAIB. (L.) Silence, and hear me. You have saved my life; nor will I be ungrateful. Look at this phial!

KENRIC. Ha! did the earl——

SAIB. Even so. A few drops of this liquor should to-night have flavoured your wine—you would never have drank again! Mark me then: when I offer you a goblet at supper, drop it as by accident. For this night I give you life: use it to quit the castle; for no longer than till to-morrow dare I disobey my lord's commands. Farewell, and fly from Conway—you bear with you my thanks.

Exit, L.

KENRIC. Can it be possible? Is not all this a dream? Villain! villain! Yes, yes, I must away! But tremble, traitor! A bolt, of which you little think, hangs over, and shall crush you! The keys are still in my possession; Angela shall be the partner of my flight. My prisoner too—Yet hold! May not resentment—may not Reginald's sixteen years' captivity—Oh no! Angela shall be my advocate; and, grateful for her own, for her parent's life preserved, she can, she will obtain my pardon. Yet, should she fail, at least I shall drag down Osmond in my fall, and sweeten death's bitter cup with vengeance.

Exit, L.

NEWMARKET AND CHESTER.

THERE are few places of amusement, with the exception of the deck of a yacht, which are so much exposed to cold winds as Newmarket Heath. There was a bitter east wind on the Tuesday of the late Spring Meeting, and it was therefore but natural that the attendance should be unusually small. Even more dispiriting than the piercing wind was the opening of the racing; out of a wretched little field of three horses, the favourite winning in a canter by five lengths. For the Prince of Wales's Stakes there was a better field, the favourite being the American horse Parole, the winner of both the City and Suburban Handicaps and the Great Metropolitan Stakes of last year. The favourite appeared to be going very well until he came to the Bushes, where he was beaten. The race was won by Ragman, a horse which had never won a race as a two-year-old or a three-year-old. Then came a two-year-old Selling Plate. A colt called Kühlehorn, belonging to the Duke of St. Albans, was a strong favourite, and the extreme outsider was a filly out of Adrastia, against whom as much as twenty to one was laid. The outsider made the running in the centre of the course, and at one time it seemed as if she were going to gallop right away from her seven opponents. But suddenly she slackened her pace, and Archer brought up the favourite. The Adrastia filly gave way in a very currish manner, and allowed the favourite to run up to her; but the winning-post had been passed before Kühlehorn had quite overhauled her, and she was lucky enough at last to win by a head. She had cost eighty guineas as a yearling, but she was now bought in for 680 guineas, which seemed a good price, considering the faint-hearted manner in which she had collapsed at the end of the race. Ten horses came out for the Welter Handicap. Here was another surprise. An outsider called Flotsam, which had won several races a couple of years ago, but had run seven times without winning a single race last year, not only won the race, but won it very easily. It was said that he won by fifteen lengths; but this, of course, must have been a mere guess. The fact was that the horse fairly galloped away from the rest of the field. He is small, but handsome, and he moves with great strength and freedom. It is said that he is a roarer, but he cannot be very badly affected at present. Two very fine races followed, in each of which there was a dead heat. The racing of the first day was by no means of the highest class as regarded the quality of the competitors or its bearing upon future events; but there were, as we have pointed out, three very fine contests, and a couple of those surprises which form at least half the interest of racing.

The racing on the Two Thousand day began badly by Rayon d'Or, the winner of last year's St. Leger, walking over for the Prince of Wales's Stakes. A handicap which followed was won by a horse of Lord Hartington's. The owner of one of the horses in a match which was to have been the succeeding race paid forfeit; and then followed a fine piece of riding by Fordham, who still further distinguished himself in the Two Thousand, which happened to be the very next race. That race, and the two following, were all hard-fought contests, each of them being won, after a hard struggle, by a head only. The last race of the day was easily won, but it brought out a good horse in Thurio, who galloped away from his opponents after the manner in which it behoveth a good horse to gallop.

We usually wish to notice the events of each day at Newmarket during the principal meetings; but the racing on the Thursday of the First Spring Meeting was so wretched that it was unworthy of description. The quality of the competitors was miserable, and only in two of the races was there anything like a contest. Except in one instance, the fields were small, from three to five horses only starting for most of the races, and perhaps the best that can be said of the day is that the weather was fine. We therefore pass over the racing of the third day without further comment, and

proceed to notice the One Thousand Guineas, which took place on the following day. The favourite for this race had at one time been Evasion, the winner of the Champagne Stakes at Doncaster. She is a fine, powerful mare by Wild Oats, belonging to the Duke of Westminster. A report, however, had been spread about that she had been terribly beaten in a trial by Muncaster, who had run second in the Two Thousand. Moreover, some good judges considered that, although she was a fine mare with plenty of bone, she did not show a great deal of quality, and that her conformation, if powerful, was not particularly symmetrical. The fine and good-looking Versigny was more fancied. She is by Flageolet, the sire of Rayon d'Or, and she had already run well in France this spring. Elizabeth had run twice last season, and had won on each occasion. In her first race, which was the Warren Nursery Plate at Sandown, she had cantered in two lengths in advance of the nearest of fourteen horses which ran against her, and she had won her second race by a similar distance in the Newmarket Houghton week. On the day of the One Thousand, she looked in the perfection of condition, but there was a rumour that she had been beaten in a private trial. Strathardle belonged to the same owner as Evasion, and as the latter was evidently the champion of the stable, the former was not backed. Yet, if Strathardle had come from some other trainer's, it is quite possible that she might have been a fair favourite. She had run within a neck of the winner of the Two Thousand in the Troy Stakes, and she had won the Prendergast Stakes at Newmarket as well as the Badminton Plate at York. Brilliancy had won a couple of races, but she had been beaten five times. Eirene had won a couple of races last year, and although she was once beaten, she had then been heavily weighted. Her breeding was excellent, as she was by Adventurer out of a Rataplan mare, and after the successes of her half-sister Wheel of Fortune last year, it was but natural that her claims to favouritism should have been respected. Another very good-looking mare was Sabella, a daughter of Blair Athol. Much of her running had been anything but creditable, but she had won the Woodcote Stakes at Epsom, in which race she had beaten the famous Prestonpans, who would probably have been either first or second favourite for the Two Thousand if his entrance for that race had not been rendered void by the death of his nominator. She had also beaten in the same race The Abbot, who had run a good third for the Two Thousand. Then she had won the Biennial Stakes at Ascot from a fair field; so that on her best form she appeared to have a very tolerable chance of winning the One Thousand. On the other hand, in addition to her very indifferent performances in some of her two-year-old races, there was the objection that she had gained a reputation —whether rightly or wrongly we are not in a position to state— of being queer-tempered with other horses, so much so that she had to be exercised by herself instead of with the rest of the horses in the care of her trainer. In Bounds, by Hermit, after an unsuccessful two-year-old career, had won a race at the end of the season, and Cipolata, a filly by Macaroni, had won four races out of six. Mirth had beaten a large field in a race during the Second October Meeting at Newmarket; she had also run second twice, besides running one dead heat.

Mirth and Eirene were restive at the post; but there was very little time lost in starting the ten competitors, who got away almost abreast. They came along in an unbroken line for a short distance, when Strathardle began to make the running, and the pace then became very good. The field kept well together as far as the Bushes, where Strathardle grew tired of making the running and fell back. As they came up the hill, Elizabeth had a slight lead, with Versigny racing alongside of her, In Bounds, Evasion, Mirth and Cipolata following within a short distance. As they came up towards the winning-post, only Elizabeth and Versigny were in the race; but the latter was tiring at every stride, and even the assistance of Archer could not keep her by the side of Elizabeth, who shot away by herself and won by a length and a half. Evasion struggled on to the end, but she was only a bad third. Strathardle, who had fallen back on giving up the running, was fourth. Elizabeth is by Statesman, a horse little known at the stud. He is by Young Melbourne out of an Orlando mare. Elizabeth's dam was Fair Rosamond, who was by King John out of Seclusion. Unfortunately, Elizabeth is neither in the Oaks nor the St. Leger. Versigny, who did not seem quite prepared, is engaged in the Oaks; and some judges think she may be considerably improved before that race.

The rest of the racing on the Friday was poor enough. A hot favourite was beaten in the first race. In the second, Merry-go-Round, of whom we have already had occasion to write this season, was opposed by two other Derby horses. He had the race completely in hand as soon as he was taken to the front, and the result was never in doubt. A colt by Speculum out of a Toxophilite mare won the Two-Year-Old Selling Stakes very cleverly, wearing down the favourite as he ascended the hill at the finish, and passing her by half a length at the winning-post. Another Speculum colt won the following race, which was likewise a Selling Stakes. This horse was Prospectus, the least fancied of all the four starters. The race was a pretty one, and it is probable that Forager, who was the first favourite, would have won if he had not run sulkily at the finish. Thirteen horses came out for the handicap which followed the One Thousand, but Friar Tuck, who had been a very bad horse last year, won it in a canter by three lengths, the favourites being nowhere near him. Regrette, by Flageolet, won the Two-Year-Old Stakes, which concluded the week's racing, without any apparent trouble. With the exception of the Two Thousand and One Thousand Guineas, the racing during the First Spring Meeting was of a very poor class, and, except on the Wednesday and the Friday, the attendance was very small. But, however justly people may abuse the week's racing, they should not forget that the race for the Two Thousand was an exceptionally fine race, and, despite the cutting east wind, the weather was dry and endurable.

Few, if any, race meetings have deteriorated so much within the last few years, without apparent cause, as the Chester meeting. For a considerable period, from twenty to forty horses used always to start for the Tradesman's Cup; indeed on one occasion as many as forty-three horses ran for that race; but for the last four years only ten horses have gone to the post, and less interest seems to be taken in the race year by year. Great efforts have been made to re-establish the Chester Meeting in public favour; the Duke of Westminster's patronage has been obtained, the course for the Cup has been shortened, and the meeting has been reduced from four to three days; yet matters seem to get worse instead of better, and the race for the Cup itself excites less and less interest. There was nothing like a good fight for any one of the races on the first day of the late meeting, and the first hard struggle was for the last race but one on the second day. Mr. Leopold de Rothschild's chestnut filly Fashion cantered in, three lengths in advance of the rest of the field, for the Cup. She had cost 300 guineas as a yearling, and had won but one out of five races as a two-year-old. This season, after losing her first race, she had won the International Handicap at Newmarket, and she afterwards ran second to Chippendale for the Great Metropolitan Stakes at Epsom. Lord Rosebery's usual ill luck at Chester again befel him. His horse started first favourite, and ran third. Last year two of his horses ran second and third, and a couple of years earlier one of his horses ran third. Considering the easy manner in which Fashion won her race, it is to be regretted that she is not entered for the Oaks or any of the important three-year-old races. Like the last winner of the Derby, she is by Favonius.

REVIEWS.

JAMIESON'S ETYMOLOGICAL DICTIONARY OF THE SCOTTISH LANGUAGE.*

THE republication of such a work as Dr. Jamieson's Scottish Dictionary is an enterprise which needs some little courage. More than seventy years have passed since the first edition appeared, and during that time vast improvements have been effected in the methods of philological science, or as some now-adays prefer to call it, linguistic. The tests for measuring and determining the affinities of dialects and languages have been laid down with an exactness which has greatly discouraged, if it has not entirely repressed, the unsystematic guesswork which, with many, had passed for scientific research; and this result has been obtained partly by the more thorough application of the comparative method, and partly by the increase of historical knowledge. The growth of the English language has in particular been examined with a careful minuteness which leaves little to be desired; and the relations of the present literary dialect to the dialects which were once on a par with it, and are still spoken by the countryfolk as they were centuries ago, have been traced with admirable clearness. The conclusions thus reached have not always been accepted without protest; and the opposition made to them has sometimes assumed the form of extravagant or amusing paradox. Few facts are established on better evidence than the thoroughness of the Teutonic conquest of Southern Britain in the fifth and sixth centuries; but the very completeness of the conquest has led some to maintain that, for all practical purposes, the old population remained where they had been, and that the English of the present day are rather a Celtic than a Teutonic people, with more points of likeness in forms of speech, national habits, and modes of thought to Hellenic than to any German tribes. Such speculations as these, which are now apt to die out quickly like fire for lack of fuel, formed the serious occupation of life for many who in the last century brought to the task no inconsiderable powers of research and a vast mass of unwieldy or useless learning. If it cannot be said that Dr. Jamieson was wholly free from these faults, this must be set down in great part, if not wholly, to the circumstances under which he worked; but it may be asserted without fear that he followed judiciously and with large success the best methods of his time, and that on this ground alone the republication of his Dictionary is fully justified.

Dr. Jamieson is not indeed one of the most perspicuous or the smoothest of writers, and sometimes we come across sentences which, to say the least, are dark and puzzling; while from a few we fail—probably from the mere awkwardness with which the sentences are constructed—to gather any meaning whatever. But the general course of his argument can be followed without difficulty, and the issue which he raises is one in which there is still room for some further examination. His chief contention is that the Scottish language is no mere dialectical variety of English; that it

* *An Etymological Dictionary of the Scottish Language.* By John Jamieson, D.D. A New Edition, carefully Revised and Corrected, with the entire Supplement incorporated, by John [illegible] A.M., [illegible], and David Donaldson, F.E.I.S. Vols. I. and II. [illegible] Gardner. 1879-80.

did not find its way to the lands north of the Tyne or the Tweed from the southern parts of the island; that the English who found a refuge at the court of Malcolm Canmore exercised on it no very momentous influence; and that it points to the occupation of the country by tribes much more closely akin to the German than to the Celtic nations during ages preceding the dawn of trustworthy or contemporary history. In short, Dr. Jamieson, in his Dissertation on the Origin of the Scottish Language, plunges into that terrible controversy which, as the readers of Scott's *Antiquary* will remember, broke up the symposium of Jonathan Oldbuck at Monkbarns. The knight against whom he hurls his weapon is the "indefatigable and erudite Chalmers," whom Sir Arthur Wardour claims as the doughtiest of his champions; while on his own side he has the more cautious scholar whom the *Antiquary* lauds as the learned Pinkerton. In few words, then, the Scottish language is the inheritance left by the old British people to their descendants who still remain in their ancient home; and thus, as Oldbuck insisted, the Picts spoke a genuine Gothic dialect, which had no more affinity with any form of Celtic speech than our English has with Welsh. In this position, although it roused the burning wrath of the good knight of Knockwinnock, there is nothing which is necessarily inconsistent with the conclusions reached by English philologists on the growth and the relations of English dialects. It does not affirm that the Teutonic invasion of this country in the fifth century was less overwhelming to the Welsh inhabitants than our most recent historians assert it to have been; all that it does is to assert that a people closely akin to the Teutonic invaders of Southern Britain had been established in the island before the days of the Roman occupation. Even at the present time such an assertion may call forth some heat of temper; but the question is one which fairly demands dispassionate inquiry. Not a few, perhaps, are ready to allow that the keels of Hengist and Horsa were by no means among the first which brought German warriors into Britain; and there is no great reluctance on the part of many to admit that the Count of the Saxon shore may have been an officer charged with the management of German settlers in the land, quite as much as with the task of guarding the coasts from the inroads of their kinsmen. The testimony of Beda, like that of Herodotus, is that of a man perfectly trustworthy on all points in which he could not well be influenced by ecclesiastical or religious prejudices. When he speaks of a popular belief we may be quite sure that that belief is rightly reported; and of the Picts he distinctly says that they had occupied the northern parts of the island, while the Britons (the name by which he always speaks of the Welsh) were in possession of the south. Nor can it be supposed that Nennius and Gildas, Welshmen themselves, were mistaken when they assert that the Picts were an entirely distinct people, who found their way first to the Orkneys, and thence to the mainland of Britain. The opinion of Tacitus on the strong likeness between the Caledonians and the Germans may go for what it is worth; but the expressions of Claudian and Ammianus Marcellinus imply a close affinity between Picts and Saxons, and this testimony belongs to a time far earlier than the Teutonic conquest of Britain in the fifth century. These, however, were not the only non-Celtic settlers in this island even before the first visit of Julius Cæsar. If we are to give credit to this singularly acute and exact observer, the Belgæ of Southern Britain belonged to the same stock with the Belgæ of the Continent, and both were wholly distinct from the Gaulish tribes amongst whom they had established themselves. As the result of careful inquiries, Cæsar makes the statement that the Belgians generally were sprung from the Germans, and that they had at an early time crossed the Rhine, and driven out the Gauls from the lands which they resolved to make their home. This at least was the tradition of the people themselves, and Cæsar adds not a word implying disbelief of it on his own part. On these facts Dr. Jamieson naturally lays great stress, inasmuch as, if the speech of the Belgæ was Gothic, the whole fabric sedulously built up by Chalmers must fall to the ground. The latter boldly denied the facts; to Dr. Jamieson, on the other hand, "the existence of the Belgæ in Britain, when it was first visited by the Romans, had always appeared an irrefragable proof that the Gothic language was very early spoken, if not in the northern, at least in the southern, parts of our island; and of itself a strong presumption that it was pretty generally extended along the eastern coast."

He next addresses himself to Chalmers's contention that the names in the Belgic parts of Southern Britain are "only significant in the Celtic tongue," and rightly urges the dangers of the elastic methods employed by that writer. Chalmers is quite satisfied that the Cantæ who gave their name to Kent, or received it from Kent, were so called as living in the open country, the British *caint*, that the Picts were named by the British provincials *Peithw*, or the people of the open country, and that the word Venta is the same as the British *gwent*, which also means the open country. On the other hand, Dr. Jamieson urges that the name Kent is the German *Kant*, a corner, extremity, or angle, like Cantyre; but although in this or in other instances he may happen to be right, he places himself on perilous ground when he undertakes to show that all Pictish names which Chalmers claims as Celtic are really Gothic, because they may be interpreted quite as easily through Gothic as through Celtic words. Thus the name Necton, he says, may be referred to the Icelandic "*necka*, incurvare, *tanne* dens, q. crooked tooth; or *neck-ia*, humiliare, *ton*, vox, q. low-sounding," while Mailcom may be "Isl. *meij*, puella, *lockun*, seductio, q. the seducer of virgins; or *maele*, speech, and *kunna*, to know, q. eloquent." This is a method of dealing with words which had a strong temptation for the old Greeks, who knew little of any language except their own; and it is less dangerous for philologists nowadays only because they have a vastly wider range for their work of comparison, and may happen to make good hits where Herodotus or Aristotle were pretty sure to go wrong.

But although the general drift of Jamieson's argument is clear enough, there are, unfortunately, portions of his Dissertation on which, as we have said, we cannot pronounce an opinion, for the simple reason that they seem to be scarcely intelligible. It may be just possible to guess at the author's meaning in the following sentences, which look much like an explanation of *ignotum per ignotius*, the most wonderful sentence in the paragraph being quoted from Ellis:—

> The circumstance of the Scottish language bearing so striking a resemblance to the English in its form, which has been undoubtedly borrowed from the French, and particularly in its becoming indeclinable, has been urged as a powerful proof that we borrowed our language from our Southern neighbours. But Mr. Ellis has manifested his judgment, not less than his candour, in the solution of this apparent difficulty. He shows that "at the era assigned for the introduction of A. Saxon into Scotland, as, indeed, it had not been previously mingled with Norman, although it had, the Saxon refugees would never have wished to introduce into that country which afforded them an asylum a language which they must have considered as the badge of their slavery."

It is scarcely worth while to attempt the disentanglement of this twisted coil, and assuredly it would not be easy to find an instance of confusion worse confounded. Happily these obscurities seem to be limited to the Dissertation. The articles in the Dictionary are for the most part perfectly clear; many of them show a profusion of learning judiciously applied; and all prove that Dr. Jamieson made good use of the best methods available in his day. Had he been writing some years later, he would probably have referred Coranich, or Coronach, and Corbie to his article on Croyn, or Crune, which he takes as denoting the low and hollow moaning of a bull:—

> Mr. Pink renders this *bellowed*; but this word, as generally used, is rather too forcible. *Rowst* corresponds to *bellow*, and denotes the roaring of cattle. But *croyn* signifies the murmuring or groaning noise made by them, when they want food, are pained, or are dissatisfied on what account soever. Belg. *kreunen, kronen*, to groan, to whimper; Isl. *hryna*, grunnire.

By carrying these words back to their root, he might have connected them with many others of the same family in which this root is found in its harder or softer forms, whether in the Latin *rudens*, the Gr. *κόραξ*, Sansk. *karava*, Lat. *corvus*, *cornix*, Ger. *Krähe*, our *crow*: nor would he have contented himself with merely comparing *corbie* with the French *corbeau*, and the Swedish *korp*. Still less would he have been satisfied with saying under *Coranich*, "This word is originally Ir., and is derived by Obrien from *cora*, a choir, which he again derives from Lat. *chorus*." Such derivations open pitfalls for the unwary. But the form Cronach speaks for itself. Nor is it surprising that he was disposed to regard as coming through French, or as being French, some words which are merely French forms of Teutonic words, as *garde* and *guerre*. In this way he treats *Bolyn*, *bowline*, and in this way he might also have treated *bowling-green*. On the other hand, there are many articles which leave little or nothing to be desired. We have heard much of the evidence of old Phœnician settlements in this country furnished by the expressions *beltane* or *bayle-fires*. Such speculations Dr. Jamieson leaves on one side, rejecting both the Semitic and Latin origin of the words. Bayle-fire, he says, is a bonfire, and bonfire is not, as Skinner "wildly" derived it, from the Latin *bonus*, but denoted simply the fire with which the dead were burnt, and hence any great fire or blaze. There can be little doubt that the first syllable in balefire is the same word which we have in Baldur, and that Grimm was right in comparing Baldur with the Slavonic Bjelbog, the white or glistering god, as contrasted with the dark or black demon Tschernibog. We have here, in short, one of the forms of the root which has long been used to express all gradations of light from the most dazzling splendour to paleness, blankness, and absolute blackness. With the same good sense, after defining *ashiepattle* as "a neglected child," and adding, "Isl. *patti* signifies puerulus," he asks, "As *aska* is cinis, what if the term denote a child allowed to be among ashes"? We may be tempted to regret that Dr. Jamieson did not think of Cinderella or Boots lying unheeded among the embers, "until," in Sir G. Dasent's words, "The time for final recognition comes, and then his dirt and rags fall off—he stands in all the majesty of his royal robes and is acknowledged once for all a king." Not less judicious are the explanations of Caterans and Culdees; but, in truth, the greater number of the articles deserve the same praise. Dr. Jamieson's book is one which has not yet lost its value; nor do we think that it is likely to lose it for many years to come.

CROKER'S BOSWELL AND BOSWELL.*

"THE Reader, like myself," writes Mr. Fitzgerald, "will be amazed to discover that 'one of the best-edited books in the English language,' as the 'Quarterly Review' styled Croker's

* *Croker's Boswell and Boswell: Studies in the "Life of Johnson."* By Percy Fitzgerald, M.A., F.S.A. London: Chapman & Hall, Limited. 1880.

'Boswell,' exhibits an elaborate system of defacement and mutilation." The reader will, we fancy, be more amazed at Mr. Fitzgerald's amazement than at anything else. Macaulay surely has written in vain, if it is left for any one to discover at the present day how Croker defaced and mutilated Boswell. Yet Mr. Fitzgerald has done some good service in the work before us by his careful comparison, in many passages, of Boswell and of Boswell as presented to us by Croker. He has, moreover, drawn attention to the fact that even in the latest editions, though many of Croker's monstrous deformities have been cleared away, yet far too many remain. Croker, as he points out with some humour, "had shown himself a perfect 'churchwarden' in his destructive labours." In spite of the meritorious efforts of more than one restorer, his whitewash and his false ornaments still to a great extent mar the beauty of the original building. Mr. Fitzgerald states that "a new and revised edition of Croker's otherwise excellent work is announced." We join with him in the hope "that what is submitted here will not be overlooked." It is, indeed, most important that the text should be restored to the state in which Boswell left it. Mr. Fitzgerald some few years ago himself published a reprint of the first edition of "The Life." We, indeed, should be inclined to adopt as the standard text the second rather than the first edition. Not a little might be said even for adopting the third, for, though Boswell did not live to carry it through the press, he had done something towards the necessary revision. Moreover, it was edited by his friend Malone, who had rendered him the most valuable assistance when his work was still in manuscript, and who therefore was admirably well fitted for the duties of editor. It is between these three editions, and these alone, that the choice lies. We have had far too much of Croker's Boswell, and we sincerely trust that his mutilated text will never be published again. His notes are a very different matter. We have never hesitated to own the great debt that we lie under to him for the light that he has thrown on many an obscure passage. Many of his explanations, no doubt, were mistaken, and a great many of his comments were very silly. Nevertheless the additions that he made to Boswellian lore were of great value. For the general reader, however, his edition is very ill-suited. Boswell in himself is, we fear, almost too long for these days of abridgments. We always strongly urge any one who asks our advice to buy a pre-Crokerian Boswell. The student no doubt finds Mr. Murray's octavo edition of the greatest service, but the general reader is likely to be discouraged by its length. But, discouraged or not, in reading it he does not, as has been pointed out again and again, read Boswell. Mr. Fitzgerald's reprint of the first edition is not only useful to the student, but moreover is far more suitable for those who are not students than any edition of Croker. It is a pity, however, that the notes to it, as we have had to point out before, are inaccurate. Accuracy indeed is not one of his merits. He has, it is clear, a great love of his subject, and he has made himself very familiar with the literature of the time. His style, however, is wanting in clearness, and his statements in exactness. The careful reader at once discovers that he is not a safe guide.

Before, however, we proceed to the less pleasant task of pointing out some of the errors into which Mr. Fitzgerald falls, we would bestow on him that praise which he really deserves. His collation of Croker's edition with the text as Boswell left it is curious and interesting. "Certain omissions are indeed," as he shows, "most unaccountable." The following is one of the instances that he gives:—

When Johnson was dying, we are told:—

"Mr. Windham having placed a pillow conveniently to support him, he thanked him for his kindness, and said, 'That will do—all that a pillow can do.'"

We look in vain for this passage in any of Mr. Croker's later editions. Why it was omitted is inscrutable.

More interesting, however, is Mr. Fitzgerald's collation of the first and second editions. Mr. Croker's corruption of the text ought of course to be set aside and treated with the utter neglect that has punished Bentley's corruption of the text of *Paradise Lost*. But the changes that Boswell himself made should be carefully shown by marginal notes in all future editions. Of his Scotticisms, for instance, many disappear in the second edition, though some remain. One or two of his stories are, as Mr. Fitzgerald shows, greatly improved. The following is an instance:—

Thus: "A foppish physician imagined that Johnson had animadverted on his wearing a fine coat, and mentioned it to him. 'I did not notice you,' was his answer. The physician still insisted. 'Sir,' said Johnson, 'had you been dipped in Pactolus I should not have noticed you.'" Now the point of Johnson's answer does not come with much comedy effect; and indeed, the supposition that Johnson had "animadverted" on his coat, so far, seems to show that the physician did not deserve such a retort. This is mended in the second edition, possibly because another version was given to Boswell, or because he recalled the true one himself. "A foppish physician once *reminded Johnson of his having been in company with him* on a former occasion. 'I do not remember it, sir.' The physician still insisted, adding, that *he that day wore so fine a coat that it must have attracted his notice.* 'Sir,' said Johnson, 'had you, &c.'" How infinitely superior this version!

These instances will show the chief service that Mr. Fitzgerald renders by his present work. We have had, we must confess, some little hesitation about quoting them, as we have some grounds for fearing that we shall be shown to be quoting what is already well known. In our review of his reprint of Boswell we quoted a letter of Johnson's which Mr. Fitzgerald thus introduced:—"This letter, which was found among Sir George Rose's papers, will be a surprise to readers of Boswell's *Johnson*." We certainly understood—though we do not in the least imply that Mr. Fitzgerald meant us to understand—that this letter had not been published previously. We were informed by a correspondent who had read our review that it had been already twice published, and was to be found in so well-known a book as Prior's *Life of Malone*. In the work before us, likely enough quite unconsciously, Mr. Fitzgerald repeats Macaulay and also Mr. Carlyle. He considers, for instance, the passages that Croker incorporates in the text, apparently in entire forgetfulness that he is following in Macaulay's footsteps. He discusses the assertion which Croker makes that Boswell was prevented by the law of copyright from making extracts from the works of his rival biographers. But Macaulay had discussed this first. The following passage, however, is the most striking instance of this kind of repetition. Mr. Fitzgerald says:—

"Davies," wrote Johnson, "has got great success as an author, generated by the corruption of a Bookseller." A happy satirical phrase, quite intelligible. But, Mr. Croker explains, "This means that Davies, from his adversity as a bookseller, had burst into new and gaudier life as an author." It certainly does not.

Now Macaulay, as every one but Mr. Fitzgerald must remember, had thus written:—"Poor Tom Davies, after failing in business, tried to live by his pen. Johnson called him 'an author generated by the corruption of a bookseller.' This is a very obvious, and even a commonplace allusion to the famous dogma of the old physiologists. Dryden made a similar allusion to that dogma before Johnson was born. Mr. Croker, however, is unable to understand what the Doctor meant. 'The expression,' he says, 'seems not quite clear.' And he proceeds to talk about the generation of insects, about bursting into gaudier life, and heaven knows what."

The praise that Mr. Fitzgerald bestows on Croker is all, or almost all, to be found in Mr. Carlyle's famous essay, though, as may be well imagined, in a somewhat different form. He fills a good many pages with quoting a great part of Croker's defence against Macaulay's attack. Yet, as he himself says, this defence is prefixed to all the recent editions. His justification for thus reprinting what most of his readers will already have at hand may perchance be that, as he intends to sit as a judge on the two disputants, it is needful to give the whole case. It might surely, however, have been a good deal more abridged. Indeed we do not know that we should have suffered any great loss had his summing-up been altogether omitted. In reading this fierce controversy we have often wondered that Croker failed to discover one blunder into which Macaulay undoubtedly fell, and which, to the best of our knowledge, has not been hitherto pointed out. Croker, in bringing a charge of inaccuracy against Mrs. Thrale, had stated that Johnson was not acquainted with the Thrales till 1765. Macaulay hereupon writes, "Mr. Croker, in reprehending the fancied inaccuracy of Mrs. Thrale, has himself shown a degree of inaccuracy, or, to speak more properly, a degree of ignorance hardly credible. In the first place, Johnson became acquainted with the Thrales, not in 1765, but in 1764, and during the last weeks of 1764 dined with them every Thursday, as is written in Mrs. Piozzi's anecdotes." Now had not Macaulay been only too eager to have a fling at his enemy he would have hesitated to bring forward Mrs. Piozzi as a witness. Her evidence on a date is almost worthless. Boswell himself, as of course was known both to Macaulay and Croker, had stated that it was in 1765 that the two became acquainted; but, as Boswell was abroad all that year, he might in this point have been mistaken. However, we have Johnson's own evidence. In his *Prayers and Meditations*, p. 191, he states, "My first knowledge of Thrale was in 1765."

Mr. Fitzgerald, in one of his discussions on a question of dates, altogether fails to see the real difficulties of the subject. He triumphs over Croker; but he triumphs without reason. All readers of Boswell will remember the famous quarrel on May 7, 1773, between Johnson and Langton at the dinner at Messrs. Dilly's. The quarrel led to an estrangement of some months between the friends. Yet two days after the quarrel we find, to our surprise, Johnson dining at Langton's house. An explanation of this may doubtless be found in the supposition that he went in fulfilment of an old engagement. Here is what Mr. Fitzgerald says on the subject:—

The question of the dining with "the testator" after the *fracas* is certainly perplexing, and, after trying all manner of solutions, the reader finds it vain to reconcile the contradiction. Strange to say, it is Mr. Croker himself, who, from a letter to Mrs. Thrale, supplies the solution. There, Johnson mentions the dinner as having taken place on May 19th, not on the 7th, as Boswell puts it; and that Johnson is right, Croker contrives to show by an allusion to the death of the Queen of Denmark, which took place on the 10th. This makes all clear; for thus Johnson dined with Langton and had his joke at the will, *before* their quarrel. Boswell, as in other instances, had shifted or confused his notes. But, with all so clear, Croker tells us "he cannot reconcile the dates."

It is by no means wonderful that Croker cannot reconcile the dates; for the dinner that Boswell describes took place, if we can trust him, on May 7th, 1773, while the dinner mentioned by Johnson in his letter to Mrs. Thrale was on May 19th, 1775, just two years later. Croker shows that the date of the letter could not have been given wrongly, for in it mention is made of the death of the Queen of Denmark. She died on May 10th, 1775. The curious fact is this. At the dinner at Messrs. Dilly's Johnson had, as Boswell tells us, a dispute with Dr. Mayo on toleration. In the letter to Mrs. Thrale, Johnson writes:—"I dined in a large company at a dissenting bookseller's yesterday, and disputed against toleration with one Doctor Meyer." The Dillys, we should add, were Dissenters. Croker, after quoting this letter, says:—"This must have been the dinner noted in

the text, but I cannot reconcile the dates." He does not go into any further consideration of the matter, but is content with thus laying down the law. He overlooks, however, one great—we might add insuperable—difficulty. In the conversation on toleration with Dr. Mayo Goldsmith took part. Now by 1775 Goldsmith was dead. Boswell's friend Temple was also one of the guests. But one of Boswell's letters shows that in 1775 Temple was at his country vicarage in the west. There must, therefore, it seems clear, have been two dinners in the month of May in different years at a dissenting bookseller's, in which Johnson disputed against toleration. In one of them his opponent was Dr. Mayo, in the other Dr. Meyer.

Mr. Fitzgerald once more opens up the interesting question of the duration of Johnson's residence at Oxford. We fail to see that he throws any fresh light on the subject. A new argument that he advances seems to us to have no weight. He maintains with Boswell that Johnson passed three years at the University. "It must," he says, "have struck every reader that all that is recorded of Johnson's position at Oxford must have taken a longer period than fourteen months to mature." *Mature*, as here used, is a somewhat odd word, but we will pass it by. He goes on to say that from these fourteen months must be deducted some months of the vacation. Now the college books show that Johnson was absent only one week in all the fourteen months. According to the present state of things, an undergraduate who should be a member of the University for two years and a half would not have passed more weeks in residence than did Johnson in his fourteen months. Mr. Fitzgerald fails to understand the entry about Johnson's caution-money, which we were the first to publish.* He describes it as "a minute claiming 7*l.* caution-money of Johnson as a set-off to a similar amount owing by him for commons." There was no claim of any kind made. The caution-money, of course, had been paid by Johnson on his entering college. He never removed his name from the books, and therefore he never wound up his account with the college. Most likely a yearly charge was made, as at present, against every one who keeps his name on the books. Nearly twelve years after he entered it was found that the amount he owed was balanced by the amount of his caution-money, and therefore his account was closed. We fail to see in this, as Mr. Fitzgerald does, "a document of almost pathetic interest."

One of Mr. Fitzgerald's conjectural emendations is uncommonly absurd. No reader of Macaulay can have forgotten the famous passage of arms between him and Croker on Johnson's θ φ. "At the altar," Johnson had written in his diary, "I recommended my θ φ." "These letters," said Croker, "probably mean *θνητοι φιλοι, departed friends.*" Macaulay at once advances to the charge, bringing with him in his train his well-known school-boy with his imminent danger of a flogging. Croker replied with "a grossly corrupt passage from Euripides." Mr. Fitzgerald quotes Macaulay's rejoinder, but makes somewhat a hash of his Greek. He adds, "I myself would offer a conjecture which seems more plausible. 'My θ φ . . .' was 'my *θετα φιλα*,' *i.e.* 'my beloved Tetty,' the *t* becoming *th* as in Elizabeth, her name. The objection from 'my θ friends' would be slight. As all Johnson's diaries were hard to decipher and transcribe, it ran probably 'my θ friend.'" The confusion in this passage is most astounding. Where did Johnson mention "my θ friends"? It was "my θ φ" that he wrote, and that, for all we can see, may be just as well singular as plural. Mr. Fitzgerald, therefore, first raises up for himself a difficulty which he has then laboriously to clear away. But, passing this over, we come next to his conjecture, and lastly to his Greek. But here we refuse to follow him. We are unwilling to invoke Macaulay's fourth-form boy, with his imminent danger of a flogging, and yet without him we can scarcely do justice to the case. Mr. Fitzgerald's English is at times as hard to understand as his Greek. The following passage, for instance, we have puzzled over in vain:—

> One would be inclined to suppose that they were owing to the promptings of Mr. Malone, who seemed to have loathed Hawkins, calling him "a detestable fellow," accusing him of stealing Johnson's watch, stick, of lying, &c. However, the Knight himself was not slack in accusing others of purloining similar articles. Some of these comments show a strange spirit of perversion. Thus Boswell: and I cannot trace the least foundation for the following dark and uncharitable assertion by Sir John Hawkins.

We must not conclude, however, without once more calling our readers' attention to the fact that there is in Mr. Fitzgerald's volume, in spite of all its inaccuracy, not a little that will interest a real Boswellian, with not a few suggestions that ought to be carefully considered by any future editor of the Life of Johnson

---

EASTERN CITIES AND ITALIAN TOWNS.†

THIS volume really consists of two different books, and they are of very unequal merit. The first is a series of records of Oriental travel. The second relates to the nooks and corners of old Italy. In the East Mr. Pullan is a stranger. In Italy he is comparatively at home. The result is that while the Italian sketches were well worth reproducing from the architectural journals in which they originally appeared, the notes on Cairo and Alexandria contain little or nothing that is new, and much that is either out of date or positively erroneous. The notes on architecture are of value; and as they are not to be found in ordinary guide-books, and are the observations of a practical architect, they are worth sifting out. But when Mr. Pullan visited the Pyramids, or, rather, the Great Pyramid, for he hardly notices the existence of any others, he merely gives the experience of thousands of other travellers, and refers the reader for further particulars to Mr. Piazzi Smyth, who "has written an exhaustive book on the subject." Can Mr. Pullan have read the "exhaustive book" himself? It is scarcely credible. Mr. Smyth, if we recollect aright, begins by stating that the chronicle of Manetho is wholly untrustworthy and must be set aside. Then he gives a list of some thirty or forty pyramids, putting them in an order of antiquity which, so far as the reader can judge, is arranged according to their distance from the Great Pyramid, so that the pyramid which all really scientific Egyptian students count the oldest is put by Mr. Smyth almost at the foot of his list. He quotes as a kind of creed the expression of one of his disciples to the effect that he believes the Great Pyramid to "contain a revelation from the Almighty, and its architect to have been divinely inspired." The author of this almost profane absurdity is recommended to his readers by Mr. Pullan; and a heavy blow is thereby aimed by Mr. Pullan at the credit of his own book. Going to Gheezeh with impressions derived from Mr. Smyth, his account of what he saw is wholly invalidated. He does not say when it was that he made his visit, but, as it was before the construction of the present road from Cairo, it must have been more than twelve years ago. Even in that unchangeable land many things have changed since then, and among them Mr. Smyth's theory, which, beginning with an article in *Good Words* on the sarcophagus of Cheops as a standard of measurement, has since expanded into one of the religions of the world. The original theory, and another on the standard of the "pyramid foot," have long been known to be founded on erroneous measurements; and the theory, such as it is —or, to speak more accurately, the hallucination—of the pyramid-worshippers, has been forced into a portentous growth. The amount of hard work, ingenious conjecture, religious animosity, and wild superstition which has been called into existence is only equalled by the enormous mass of literature which they have produced. Freemasonry has of late years been poaching in Mr. Smyth's manor, and an American engineer has been so moved by the sight of two little holes in the base of the obelisk which has been so wantonly removed from Alexandria, that he writes enthusiastically to the papers on the Freemasonry of the time of Cleopatra. There is, unhappily, enough credulity and stupidity in the world without the religion of the pyramid; and Mr. Pullan should have known better than to recommend Mr. Smyth's book. It is possible, however, that Mr. Pullan wrote his essay at the time he visited Egypt, which, as we have seen, must be above twelve years ago; and in those days the views of Mr. Smyth had not reached their present development. But this is no reason why Mr. Pullan should not have corrected his early impressions before reprinting them. A paragraph or two is devoted to all the other pyramids, and the rest of the chapter relates to the tomb of Shoofoo. Mr. Pullan says there are also pyramids "at Sakkara, Abourouel, Abousir, Dashour, Metanyeh, and Meidoun." We never heard of Abourouel before. Perhaps Aboo Rowash is intended. Metanyeh is also new. It would be interesting to know in what part of Egypt it lies. There is a place called Matarieh near the site of the ancient Heliopolis, or On, but no pyramids are at that side of the Nile. Though Mr. Pullan notices the Sphinx, he does not mention the granite and alabaster building beside it; a strange omission for an architect, as it is certainly, although its exact date remains a question, the earliest building excepting a pyramid yet discovered. Moreover, he calls the Sphinx, throughout, "she"; though, in the tablet of Thothmes IV., which he mentions, and in every other ancient inscription relating to it, "he" is the form employed. Altogether, this chapter, "A Peep at the Great Pyramid," is most disappointing, and goes far to spoil the whole book.

In the chapter on Alexandria Mr. Pullan makes some notes upon the fact that "hitherto in the history of the world practical results show that the larger number of great works of art have been accomplished under despotic rulers." The Parthenon was built by Pericles when he had become master of Athens. Rome owes the Colosseum to the Cæsars, not to the tribunes. Venice "owes all its finest structures to the doges of the time of its oligarchy, not to the time of its democracy; and liberal Italy is destroying, upon the plea of restoration, what despotic Austria would have religiously preserved." Paris was re-built by Napoleon III.; and Alexandria, "the city of the conqueror of the world," was designed by Dinocrates for Alexander. A very interesting account is given of the architectural remains on Mount Moriah. Mr. Pullan descended to the extensive vaults, in spite of much obstruction on the part of the Turks and his own dragoman. The descent is difficult, and a careful examination has not yet fixed the date, which may be only of the age of Justinian, or may be of a much earlier period. At Bethlehem, Mr. Pullan seems to been less interested in the sacred associations of the place than in making the discovery that the church "is the earliest basilica in existence, and the only one which has come down to us in an unaltered condition." It remains as it was left by St. Helena—the lady whom an American author, accepting the tradition of her British origin, recently described in a history of the Cross as "the old English-woman." The only additions are the roof, the mosaics of the twelfth century, and a "monstrous wall, which has been built between the

* See *Saturday Review*, September 12, 1874.

† *Eastern Cities and Italian Towns.* By R. P. Pullan. London: Stanford. 1879.

nave and transepts as a barrier—a practical and tangible excommunication of the Greeks by the Latins, or of the Latins by the Greeks." The building is cruciform in plan, there is a wide nave with double aisles, and the eleven bays are marked by monolithic columns. The capitals are very classical in character, but the entablature with frieze and cornice above is overloaded with ornament of a later type. The transepts terminate in apses, and there is another at the east end. The roof is of cedar. The idea entertained by some writers that this church was one of those rebuilt by Justinian is, in Mr. Pullan's opinion, refuted by the character of the architecture. "The trabeate system here observable died out in the time of Constantine, and was replaced by the arcuate system, which became universal before the time of Justinian."

The first chapter of the second portion of the volume contains an interesting account of the discovery of some ancient walls and traces of a vast fortification in the Maremma. It has been sometimes identified with Vetulonia. Mr. Pullan gives reasons for considering it older than either Roman or Etruscan times. The Romans and Etruscans built with a certain degree of regularity, and with large stones. The wall on Monte Leone is irregularly built of small stones, the faces untooled. Another little-visited place in the Roman marshes is Corneto, the "Queen of the Maremma." Tradition says that Corneto, the cradle of the "proud race of Tarquin," was once surrounded with a hundred towers. About ten still remain, incorporated into houses and other modern constructions. One near the cathedral is still nearly one hundred feet in height. The cathedral presents unaltered the "arrangements of about the year 1100." The sanctuary is reached by two sets of steps from the nave, and has a baldachino in the centre, so placed that the celebrant "must stand with his back to the apse and his face to the people." Mr. Pullan adduces similar examples at Terracina and Toscanella of this very ancient usage. Close to Corneto is an extensive series of very ancient tombs, which have been described by Mr. Dennis and others. They singularly resemble similar remains in Egypt, especially in the character of the scenes represented on the walls. "Figures half life-size engaged in funeral feasts, hunting, racing," merry-making, loaded tables, couches, performers on flute and pipe, dancers—the description reads like a passage relating to an Egyptian grotto of the Twelfth Dynasty.

Mr. Pullan goes on to describe Toscanella, Falerii, and other places, and we must hope he escaped malaria in his researches. It requires some courage in these days to visit the dead cities of the Roman Campagna; but the architect and archæologist are amply rewarded. With respect to the characteristics of the modern Italians, and especially of the official class, Mr. Pullan echoes the same unfavourable opinion which many recent travellers have been forced unwillingly to form. "In no other country except Turkey is the patience of the traveller by railway tried to such an extent as in Italy." It is needful to arrive at the station half an hour before the time. The clerk seems unequal to the labour of giving out tickets. Paper money would not appear to be a rapidly circulating medium, for "certain notes are refused at the stations though taken elsewhere"; and Mr. Pullan has seen intending passengers left behind in despair because their notes were not those of one of the favoured banks. In Turkey things are perhaps worse, "for, after the custom of their country, obstinate peasants will still persist in trying to bargain for their tickets by offering at first one-half of the sum demanded." At Turin Mr. Pullan saw what he considers one of the greatest works of genius in the world. It will be wholly new to most people to hear this phrase applied to a half-finished modern building designed for a Jewish synagogue, by an engineer, Signor Antonelli. The Jewish community have exhausted their funds, and the gigantic shell, 240 feet in height, has been sold to the municipality, and may eventually be turned into a museum. The mode of construction is bold in the extreme, being so slender that it is a wonder how the building can stand a day; yet the conditions of equilibrium seem to have been so carefully fulfilled that there is no danger of its failure. Mr. Pullan's description is not a model of clearness, and we cannot make out from it whether the dome has been completed, and, if so, what is its size. The central chamber "is the highest in the world, being 200 feet in height." The Jews do not seem to have acted with their usual prudence and economy in their dealings with this abortive synagogue, for after spending 24,000*l.* upon it they sold it unfinished for 6,000*l.* Although intended primarily for architects, Mr. Pullan's papers will be found interesting by many travelled and untravelled readers who can build nothing for themselves except the gorgeous palaces and cloud-capped towers of a day-dream.

A CONSUL'S MANUAL.*

IN his preface Mr. Joel says that his modest aim in writing this manual has been to supply his colleagues with a book of reference, and to put into the hands of the British shipmaster such information as he could otherwise only acquire by experience and a careful study of the Acts of Parliament relating to merchant ships and seamen. Mr. Joel has no doubt often felt the want of some such work in the discharge of his consular duties, and learnt how useful it would be to shipmasters, the class of men with whom the consul has his principal dealings. The only book of the sort which has been available hitherto, Mr. Tuson's Manual, has long been superseded by new Acts of Parliament, and new orders from the Foreign Office and Board of Trade. Even the original books of instruction issued by those departments have become little less antiquated than Mr. Tuson's work. Every few years some new Act of Parliament appears, and new orders or modifications of old ones are issued by the consul's superiors every few months. He has these Acts and orders scattered in many separate documents, but he probably will be not the less pleased to have them again in a more handy shape. Of course the greater part of a book of this class must be taken up with reprints of laws, forms for documents, and definitions of terms. It fulfils its purpose if the reprints are conveniently arranged and the definitions clear. In neither respect is there any fault to find with Mr. Joel's book. Of the seven parts into which it is divided, the second is devoted to the laws settling the qualifications for ownership of British ships, and providing for mortgaging, purchasing, and provisioning them, or keeping their crews in health. The relations of the Consul to the master and crew are treated in the third. The fourth deals with his legal duties, and the delicate question of the interference of foreign law courts; and the fifth with his duties in cases of wreck, casualties and salvage. The last two parts are devoted to definitions, glossaries, and forms.

It will easily be seen that the officer who has to deal with all these questions has a large field of action before him, and yet they by no means include all a Consul's duties. He is also a political agent, and holds to a certain degree the place of a *quasi* ambassador. With these duties and the qualifications required for their discharge, Mr. Joel deals in Part I. of his Manual. If the lay reader concerns himself with the book at all, he will probably find more to interest him in this than in any other part. The Consul, in the opinion of most Englishmen, is an officer stationed abroad to supply general information, give hospitality to travellers, and extricate his countrymen from the innumerable difficulties into which they contrive to fall when business or pleasure brings them to his port. This idea is not very far wrong. The Consul is, indeed, expected to do all these things, and does them, too, in a fairly efficient way; but wonderfully little is known of the nature of his service or the very small amount of support he receives in the discharge of his duties. Still less is known of the wide difference between one Consul and another—between, for instance, the representative of England at Beyrout and the officer of similar title at Bordeaux. In his introductory sketch of the history of the service Mr. Joel starts from Julius Cæsar, who, he tells us, "discarded the title of Consul for that of Dictator," B.C. 46. Mr. Tuson was ambitious of even a longer pedigree, for he discovered a Consul in Herodotus. That officer's post, if our memory does not deceive us, was at Memphis. The title was revived, it seems, by Roger I. of Sicily in Messina. Mr. Joel then proceeds to cite the "Consolato del Mare," which he apparently considers as the direct ancestor of the Board of Trade Instructions. Next we come to the Italians, who, "then known by the name of Lombards, created a number of consulates for the decision of commercial questions, and the due observance of treaties and conventions." It is obvious that the judge appointed by King Roger at Messina had no resemblance whatever to the English officer, also called a Consul, who is appointed there by Queen Victoria; but we have cited Mr. Joel's curious historical speculations because we think his confusion of ideas on the subject has been produced by observing the confused system on which his own service is conducted. An English Consul in a Mahometan country, in China or Japan, does not bear much more resemblance to an English Consul in France than either of these officers does to the "toga'd consuls" of whose military skill Iago had so low an opinion. The former is a very important person. Like the Venetian Consuls at Aleppo, Alexandria, and Jerusalem, who are brought in by Mr. Joel much more appositely than Julius Cæsar, he is a judge among his own countrymen and in cases between them and natives. He can imprison offenders who have been found guilty in his court. His power and security are provided for by treaty and supported by gunboats. He often exercises great influence among the natives of the country in which he is stationed, and perhaps defends them from wrong at the hands of their rulers as much as he does his countrymen. Consuls of this class were at one time the only officers of the name employed by the English Government, and were only stationed on the north coast of Africa or in the Levant. These posts were, and are, at times as dangerous as they are important. The outrage at Salonica showed that even in these days a Consul might still find himself in the disagreeable position of his predecessor in Algiers, who, if the old sea song deserves any credit, "quoted Puffendorf, and Grotius, and proved by Vattel exceedingly well, that to hang him would be atrocious" when he was threatened by the Dey. A Consul in a civilized country, or in a country called civilized by courtesy, such as certain of the South American Republics, is a much less important person. He pays for his safety by loss of power. Mr. Joel, indeed, dwells somewhat on the dangers which members of his profession run in the discharge of their duty. He was once, he tells us, nearly killed by certain persons whom he ironically calls "guardians of the public order." It is also true that one of the many parties in a Spanish town during the first Carlist war proposed to hang H.B.M. Consul if the English squadron did not leave the coast.

Such perils as these are, however, rarely met. The great difficulties of a Consul's life are not revolutionary disturbances, nor even

* *A Consul's Manual and Shipowner's and Shipmaster's Practical Guide in their Transactions Abroad.* Compiled by Q. Joel, of Her Majesty's Consular Service. London: Kegan Paul & Co.

the epidemics on which Mr. Joel dilates, but the trouble he has in carrying out the regulations referring to masters and seamen contained in the third part of this Manual. At the very outset it is stated that "any seaman or apprentice who desires to make complaint to the Consul is permitted to go ashore, in proper custody, to make such complaint, under a penalty of 10*l*. on the master if, without reasonable cause, he refuses to allow it." We have quoted this passage because it illustrates admirably the nature of a Consul's duties—what may be called the lofty pretensions of his position, and the very limited amount of power with which he is endowed to support them. He appears here in the character of a magistrate, and it might be supposed that he would be supplied with power to enforce his decisions; but that is very far from being the case, as may be seen from Mr. Joel's book. A Consul has, as he points out, no power to enforce the penal clauses of the Merchant Shipping Acts, except, as already mentioned, in barbarous countries. Thus, in this matter of seamen's complaints, his interference is practically reduced to a mere matter of form when he has to do, as is generally the case, with obstinate and wrong-headed men. He must listen to every complaint, however absurd, knowing all the while that the talk is pure waste of time. The regulation says that the man is to be brought to his office "in proper custody"; but it does not say what "proper custody" is, or how it is to be provided by the master. A ship captain has no authority over his men when once they have landed in a foreign country; and he cannot call on the local police to arrest a man who has as yet committed no sort of offence. Again, a master must show "reasonable cause" for refusing to let a seaman go ashore to complain; but he is nowhere told what amount of cause is reasonable. The Consul has no police at his disposal; and, even if he visits a British vessel himself for purposes of inquiry, he cannot tell, unless he has been a naval officer, whether the work to be done on board affords the master reasonable cause for keeping the man back or not. The man who wishes to complain is not even bound to state beforehand what he proposes to complain about, and so any bad character (and if the almost universal testimony of masters and Consuls is worth anything, bad characters now abound on our merchant ships) can secure a good chance to desert, or worry the master and Consul into letting him leave the ship. Even when the man complaining is not a bad character, but only a very wrong-headed one—and sailors are often strangely whimsical and childish—he may give a great deal of trouble, and cause an immense amount of quite useless talking. What is even worse is that, where there is ground for serious complaint by the man against his master, or by the master against the sailor, or between man and man of the crew, the Consul is practically helpless to see justice done; he can only tell the parties to wait till they get to England, and settle the question there. It is not only by quarrelling with their masters, or with one another, that sailors employ the Consul's time. He has to provide for them when destitute, whether by their own misconduct or by shipwreck; to see that they are properly paid when sickness compels them to leave their vessel; and to act as their executor when they die abroad. He is equally at the beck and call of all British subjects who have business in foreign lands. Merchants who are trying to recover bad debts, wives who have been deserted by their husbands, clerks on the look-out for employment, write and appeal to him. He is the refuge of all who are destitute or in trouble, from the wandering acrobat out of work to the gentleman in search of sport whose gun has been impounded by the Custom-house. In the Consular Reports published a few years ago, one Consul stated that he had been requested by the friends of a young lady, who was coming out to be married to a British subject at his port, to receive her into his family, have her married from his house, and, it would seem, supply the wedding breakfast.

An officer who is to serve the public in so many ways must be a man of many accomplishments. Mr. Joel devotes a chapter to the qualifications required for the post. It will surprise the reader to see how little book-learning is considered necessary in these days of competitive examinations. A Consul must be able to write English, must know French, one other language, either German, Spanish, Portuguese, or Italian, and have some knowledge of Smith's *Compendium* and Colenso. So little will hardly get him a clerkship in a Government office at home. But his post is one which merely scholastic qualifications would never fit him to fill. What is required is tact and power of managing men. Allowing for professional enthusiasm, Mr. Joel is right in saying that

> A Consul to be an efficient officer should in addition to these requirements possess special qualifications and attainments to enable him properly to discharge the important and multifarious duties of his office. He should be courteous and prudent, free from passion and firm in resolution. He should possess habits of thought and industry, for it is his duty not only to acquire such information as may be of service to his countrymen in arts, commerce, and manufactures, but also to impart it. He should be without prejudice and his mind should be so balanced as to enable him justly and fairly to decide all questions submitted to him. He should be well versed in the law of nations, and should make himself thoroughly acquainted with the laws, municipal ordinances, and the tariff of the place to which he is appointed. He should be polite and circumspect in his intercourse with the authorities of the port or place of his residence, as his usefulness to his countrymen in cases of emergency, especially in places distant from the great capitals and commercial centres, will frequently depend upon the personal influence he may acquire apart from the powers and privileges conceded to him by usage or secured to him by treaty.

The whole art and mystery of a Consul's business is contained in the words "personal influence," and that is a thing which cannot be learnt from books. A Minister can only be sure that his subordinates will exercise it when he appoints able and experienced men to these posts. The wide discretion which is wisely left to the Foreign Secretary in appointing Consuls enables him to secure fit men who could not be used if our service were organized as rigidly as the French. Undoubtedly Consulates were used in former times as refuges for the dependants or broken-down friends of Ministers; but no Minister in our time, unless he were strangely eager for difficulties in Parliament, would appoint a notoriously unfit man to a place in which he might so easily cause trouble. Mr. Palgrave and Captain Burton are examples of men eminently fitted for the work, whose services could have been secured in no European country but our own, and many others might be cited. Experienced naval officers would perhaps make the best Consuls; nor would it be difficult to find plenty of them ready to undertake the work in these days of stagnation in promotion.

Mr. Joel's work is also intended for shipowners and shipmasters. It will not be less useful to them than to Consuls. Shipmasters in particular, in spite of the strenuous efforts of the Board of Trade to enlighten them, are often strangely ignorant of the limits of their power over their men; and this has not a little to do with their loud complaints of the worthlessness of their crews.

POET AND PEER.*

In these days of careless and ill-considered writing, when anything seems to be thought good enough for a much-enduring public, it is satisfactory to read a novel like *Poet and Peer* that shows signs of reflection and conscientious workmanship. Mr. Hamilton Aïdé has worked out his Wilfred, Lord Athelstone, with a blending of sympathy and dispassionate severity. The promise of the young heir-apparent to the Athelstone earldom is nearly all that can be desired; and though his "head is on fire" with warm fancies, we cannot doubt that the youth will steadily calm down with maturing years and the responsibilities of his inheritance. It takes some time before we discover what the author has clearly foreseen, that there are certain qualities inherent in Wilfred's nature which may be fatal to our expectations of final amendment. His apparent intellectual independence and precocious decision of character are really the germs of stupid stubbornness. And, like some eminent statesmen of our own times who are conspicuously before the world, quickly and lightly as he can change his convictions, he is invariably assured of his own infallibility. His lively fancy is always flying off at a tangent, and his poetical imagination clothes his far-fetched theories in colours more attractive to himself than to other people. In short, the young Lord Athelstone has been destined by Providence to be the tool and victim of designing people. Had he only had his own interests to care for, we should have watched his career with the calm interest of serene philosophy. But, as the author means to introduce excitement and sensation into his novel, he has staked the happiness of an engaging heroine on the wayward caprices of his eccentric hero. Nellie Dawson, who in her unconscious simplicity is all that is fascinating, deserves the happiness that eludes her grasp. The first meeting of the youthful pair is idyllic, and affords no unfitting inspiration for the day dreams of a youthful poet. The Honourable Wilfred, an Eton boy come home for the holidays, is lounging over a gate on his ancestral domains, when Nellie Dawson, in the innocent attractions of light costume and careless childhood, is framed in the glories of the sloping sunbeams, and dazzles the impressionable imagination of the dreamer. Naturally the peasant child recognizes the hero of her fancies in the brilliant young aristocrat, who, far from condescending to her, seems to throw a certain bashful timidity into his address. Most unfortunately for the two, these impressions prove indelible on both sides. Wilfred professes to hold in sovereign contempt the adventitious advantages of birth and station. Born to a good property and welcomed in the best society, he fancies that he can afford to throw the handkerchief where he pleases. On the other hand, he is singularly susceptible to the influences of beauty and innocence combined. Admiring himself beyond most other people, he behaves towards Nellie with characteristic selfishness. He believes himself to be nobly disinterested and independent when he is compromising the village girl by his attentions. Circumstances separate only to reunite them. Their fate is to become husband and wife, and they cannot avoid it. Yet the match could hardly have been conceivable had not events conspired to smooth the obstacles away. The death of Wilfred's father has left him absolutely his own master; while Nellie Dawson has been educated into a capacity to do honour to any station, by association with refined and cultivated women. She has treasures of affection to give away, and she lavishes them all upon her husband. Unfortunately his strong feeling for her had been a fancy, and ultimately he had married her in a moment of pique. His innermost idea is that he has given her much and received little or nothing in exchange. He does not trouble himself to develop the fascinations which her shy humility is inclined to suppress. She finds herself living in a chilling atmosphere of indifference, while her husband neglects her for other women to whom he is attached in the bonds of a platonic intimacy. To the last, so far as she is concerned, he is deaf and blind and stupid.

* *Poet and Peer*. By Hamilton Aïdé, Author of "Penruddocke," &c. London: Hurst & Blackett. 1880.

while she suffers and pines away under his neglect. The author has been scientifically working up to his *dénouement* through chapters which are sometimes slow and inclined to drag. But in the closing scenes of the heroine's hapless life he displays no ordinary powers of pathetic description. Nellie, who has passed from despondency to despair, who has come to feel herself an incubus on the husband whose happiness she would have promoted at any sacrifice, deliberately decides to relieve him of her by breaking the fetters that bind him. To the reader it is apparent that, quite innocently of course, she is condemning him to go through refinements of torture. For nothing surely could be more stinging to a right-minded, though much-erring, man, who is in due time to experience the agonies of remorse, than the exquisitely pathetic expressions of forgiveness with which she takes leave of him on her death-bed. Each word, as it is uttered with the tenderest intonation, conveys the quintessence of bitter reproach. And yet we feel, knowing her fickle husband as we have been taught to know him, that possibly, so far as his earthly future is concerned, that melancholy inspiration of his wife's was a happy one. We leave him crushed down under grief and remorse, no doubt; yet it is more than on the cards that he may marry and console himself. For there is no possibility of counting on his wayward moods; and his talent of ingenious self-deception may serve him even when his lasting wretchedness seems assured.

The byplay of many of the minor characters is excellent. Mr. Aïdé evidently knows society well, and is as much at home in society abroad as in England. Great part of the time is passed in Rome, where he has steeped the scenes in local colouring. Indeed not a few of his most distinctive Roman types strike us as being closely painted after the life, or from models that wear very transparent veils. Little Miss Decker is especially good—the literary and artistic American spinster, who in her sublime independence as an unprotected female discards the conventionalities that are the ordinary safeguards of her sex; who is a characteristic medley of bluntness, want of tact, and good nature; who is ready enough with retort and repartee, though she has a knack of saying the wrong thing at the wrong times; and who makes no secret of her professional mission as interviewer and correspondent for an enterprising New York journal. Among the most noteworthy of the men is Mr. Briggs the artist, clever, vulgar, and perfectly good-humoured, who carries the tinge of sensuality in his jovial nature into the subjects he selects for the exposition of his powers. There are some brilliant rallies over the dinner-table—to borrow the language of the prize-ring—between the materially minded Briggs and his acquaintance Professor Spooner, a transcendentalist whose principles are severely ascetic. Then there is that sleek and silver-tongued Church dignitary, the Lord Bishop of Oporto, who exerts his really considerable talents in efforts to make the best of both worlds; and who prides himself on showing to advantage as an ornament of society, while never appearing to ignore the responsibilities of his spiritual rank. The ladies who stand out most conspicuously from these social groups are Sylvia Brabazon and Mme. de Waldeck. In the one case involuntarily, in the other with most malicious purpose, they exercise a commanding influence on the fates of the young Lord Athelstone and his lowly-born wife. When the peer first has an opportunity of admiring Miss Brabazon, her face and figure, and the soul shining from her eyes, appeal irresistibly to his romantic susceptibilities. So far as appearance, costume, and an almost aggressive independence of other people's opinions go, Sylvia is an exceedingly strong-minded woman. But, as it happened, in opposition to ordinary rules, the strength of mind in her case did not lie only on the surface; and had she chosen to take her adorer in hand in earnest, she might have imposed her will upon Athelstone without an effort. Unfortunately for him, still more unfortunately for the luckless girl he marries, Sylvia hesitates till she irritates his vanity and sees him slip through her fingers. She cannot decide whether the task is worth undertaking; for though he has touched her heart, she knows all the time that he is altogether unworthy of her. We must say that, for ourselves, we should have found it difficult to reconcile a belief in Sylvia's strong good sense with her ludicrously affected style of dress. When she first dawned on the sight of Lord Athelstone, as she stood on the sunny terrace of the Pincian, "she wore a dark-red robe—it would be sacrilege to call it gown or frock—trimmed with fur and made as nearly as possible like that we are accustomed to associate with Faust's Marguerite. A velvet and gold bag was slung at her side, and on her head was a small cap of fur. Beneath it her hair, which was of a reddish-brown and very thick, hung in loose coils in a net far down her back." An unpleasantly fantastical-looking young woman, we should have said; but, if she seemed to have stepped from the canvas of some quaint pre-Raffaelite artist, or escaped from the green room of a second-rate Roman theatre, any external oddities were more than redeemed by lustrous eyes of grey and an expression of exquisite sweetness. In any case, we come to forget her personal eccentricities in the excellence of her warm heart and the breadth of her delicate sympathies; while, though she is never trammelled by social conventionalities, when any work of charity or mercy is to be undertaken her feelings are as womanly as need be desired. Very much the reverse is Mme. de Waldeck. The pair—or the rivals, as perhaps we may call them—have nothing in common but their talents and good looks. As Miss Brabazon, had she so willed it, might have become Athelstone's better angel, Mme. de Waldeck makes herself unmistakably his evil inspiration. To do him justice, his attachment to her after his marriage is rather intellectual than anything warmer. She assures to herself an almost absolute command of his actions by flattering the foibles which she is quick to detect and insinuating herself into an intellectual partnership. But it is certain he would never have entangled himself in her snares had she not been a pretty and fascinating woman; and the jealousy that shatters the health of his wife is founded on feelings that are natural, and even reasonable. The final chapters, as we have said, are worked out with great skill, where Nellie wastes away in the presence of the siren who has forced herself into the domestic intimacy of the Athelstones. The story is a sad one, and the conclusion is especially melancholy; yet it is sufficiently relieved with brightness and humour to make it, not only interesting, but agreeable reading.

—

MACDONELL'S FRANCE SINCE THE FIRST EMPIRE.*

DR. MAGINN used to say that when once a man had seen his articles in print within a few hours of their being written he was never as good as he might otherwise have been for work of a more deliberate kind. It is certainly true that political journalists have seldom done much in those departments of literature for which their profession might have been supposed to be a special preparation. There is something, perhaps, in the necessity of bringing every subject within the limits of a column and a quarter, and arranging it instinctively in three or four paragraphs, that unfits a man for working on a larger scale. Or it may be that the habit of dealing with questions of the moment makes it especially difficult to deal with larger subjects in the spirit which befits them. Even if, from temper or circumstances, the journalist is led to cultivate impartiality, his impartiality is different from that of the historian or the political philosopher. It is the impartiality which strives to do justice to an adversary—to state his case fairly, to make allowance for his prejudices, but to treat him as an adversary all the same. This temper has not always been fatal to historical reputations, but it more and more tends to become so. If Mr. Macdonell had lived to make *France Since the First Empire* what he intended it to be, he might have conquered the difficulty; but in the very interesting fragment published by his widow he can hardly be said to have done so. His intention was to "describe fully the four great parties which govern France—the Legitimist, the Orleanist, the Bonapartist, and the Republican." Mr. Macdonell's notes upon the last of these parties were not sufficiently forward to admit of publication, and even of the rest only a single chapter was left in the state in which he meant the reader to see it. It is probable that the rest were meant to be thrown into a more historical and narrative form than that in which they are actually cast. Undoubtedly they would have benefited by the change, but we cannot feel sure that Mr. Macdonell would have been able so far to withdraw himself from existing controversies as to make his judgments really impartial. It is quite possible to hold that a Legitimist or Orleanist restoration would be a misfortune for France, and yet to see that it is equally a misfortune that either dynasty should have been violently overthrown. No concessions on the part of the King and no amount of moderation on the part of the people could have averted the first Revolution. The great fabric of feudal and absolutist ideas could never have been displaced except by an earthquake. But the revolutions of 1830 and 1848 were revolutions of a wholly different kind. They were not unprovoked, but they were unnecessary. Everything that the authors of them professed to desire might have been attained more surely by the exercise of a little patience. Unlike the first Revolution, again, those of 1830 and 1848 were conceived and executed in Paris. In each case the acquiescence of the country was due rather to indifference than to approval. Both the Orleanists and the Republicans may be said, therefore, to have deserved ill of their country—the one for violently getting rid of Charles X., the other for violently getting rid of Louis Philippe. This fact may go some way to account for the strange detestation in which even sensible Royalists seem to hold the Republic. They feel that it was merely the perversity of a few excited Parisians that overthrew first the Legitimate and next the Orleanist dynasty. A little more wisdom on the part of the sovereigns attacked, a day or two's delay on the part of the populace which attacked them, was all that France needed to start her in a career even of peaceful improvement. Had Charles X. been allowed to abdicate in favour of his grandson, Henry V., brought up amidst different surroundings, might now have reigned over a nation which for more than sixty years would not have known a revolution. Had Louis Philippe been given time to master the facts of the situation, the Count of Paris might now have been reigning over a nation which for fifty years would not have known a revolution. Englishmen may read in these events the lesson that a nation will for the most part do well to bear the ills it has; but the partisans of the fallen dynasties will be more likely to remember the insufficiency of the occasions which overthrew them and the mischiefs which have followed upon their overthrow.

The best chapters of Mr. Macdonell's book are those which are most unmistakably "articles." He would have been seen, therefore, to greatest advantage in dealing with the Republic, its recent triumphs, and its immediate future. Unfortunately this

* *France Since the First Empire.* By James Macdonell. Edited by his Wife. London: Macmillan & Co.

part of his labour was only begun. Mr. Townsend, who in a short closing chapter gives the reader the general result of Mr. Macdonell's notes and conversations on the Republicans and their fortunes since 1870, says that "the conflict between the Republicans and the Anarchists he did not dread at all, and in fact did not believe in. . . . Society in France is founded on a rock. It is the one country in Europe in which social revolution—that is, successful revolution—not a mere *émeute*—is impossible," the reason being that "taking the landholders, the rentiers, and the people with hoards together, eight Frenchmen in every ten hold property." No doubt this is true; but when Mr. Macdonell went on to infer from it that the Republic would succeed, we do not feel sure that he allowed sufficient importance to another aspect of French character which at the same time he very clearly realized. He admits that "the Republican inability to leave the Church alone" is a danger to the Republic, and in the chapter on the Clerical party he brings out the nature of this danger with great clearness. The conflict between the Church and the Republic is not a conflict between religious fanaticism and religious indifference. It is a conflict between two fanaticisms. The hatred which the Republicans bear to the Church is as genuinely theological as that which the Clerical party bear to the Republic. It is not the abuses of Catholicism that the French Radicals are fighting against, but Catholicism itself. The *République Française* has frankly declared that the moderate and conciliatory Leo XIII. is a more dangerous enemy than the violent and uncompromising Pius IX., and a large part of the more extreme Radical polemic must be as odious to religious Protestants as it is to Ultramontanes. When to this is added the unfortunate disposition of French parties not to be content with merely defeating and disabling their enemies unless they can also make their lives burdensome by injury or humiliation, the prospects of the Republic will scarcely seem so assured as they did to Mr. Macdonell. It must be remembered, however, that he wrote before the recent developments of the ecclesiastical policy of the French Government. He saw the quarter from which the storm would come, though he did not perhaps foresee the force with which the wind would blow.

Why is it that Englishmen take so much interest in French politics? In his opening chapter Mr. Macdonell sets himself to answer this question. It is not merely that France is a near neighbour, for there are other near neighbours—neighbours, too, in whose fortunes England may some day be intimately concerned—about whose politics we know next to nothing. It would be curious to inquire how many Englishmen could give the name of a single Prime Minister of Holland since the establishment of the kingdom. This ignorance may be due to strangeness of tongue and want of exciting controversies; but neither of these reasons holds good of Belgium. That country, at all events its cities, is as often visited by Englishmen as France itself, and the theological controversies which are a source of so much danger to the French Republic are a source, not indeed of danger, but of disquiet, to the Belgian monarchy. Yet we know next to nothing of Belgian affairs. Probably that which makes the difference is the fact that what in Belgium is only a source of disquiet is in France a source of danger. It is a dull thing to watch the peaceful application of political principles. English politics do not interest foreigners except when they happen to bear on the Eastern question, and foreign politics do not interest Englishmen unless something more than a principle is at stake. How many of us know anything of the political history of the United States before the rise of the Abolitionist movement? Yet in those earlier years of the Republic questions of even more political moment were being debated and determined than those which were raised by that agitation about slavery which in the end brought about the War of Secession. If Frenchmen devoted themselves with as much calmness as the first generation of American statesmen to the consideration of those "unsolved political problems" of which France has so large a store, we doubt whether the fact that these problems "go down to the roots of government, religious conviction, and society," would keep Englishmen interested. They would require in addition the anticipation of some new and great change in a history which has already been seamed with revolutions. So long as Napoleon III. was in power there was the constant expectation of some sudden excitement in the foreign policy of France. Since Napoleon III. ceased to reign there has been the constant presence of excitement in her domestic policy. The happiness of the nation that has no history is a happiness towards which Frenchmen seem to feel no inclination. This is not a heroic explanation of English interest in French affairs, but we suspect it is the true one.

We must not take leave of Mr. Macdonell's book without mention of the touching and womanly preface contributed by his widow. There is something singularly pathetic in the kind of stifled sob with which she speaks of the unfinished and larger part of the work. "The writing of this portion was never even begun. I have a volume of notes—all that is left of countless hours of patient study, and of conscientious research." In Mr. Macdonell's too early death journalism lost a worker of singular zeal and industry. "No man," to quote once more his widow's sorrowful tribute, "was prouder of his profession, no man ever strove harder to put his conscience into all that he did. . . . Personal comfort, pleasure, health, all were disregarded, until the full claims of his professional duties had been fulfilled." A book put together in the rare leisure of such a career has a claim to be judged leniently, but in commending *France Since the First Empire* there is no need to employ this plea. If the book is not so good as the author would have made it had his life been longer, it is still the best sketch of contemporary French politics to which an English reader can be referred.

FIFTY YEARS' COLONIAL EXPERIENCES.*

A PERUSAL of this volume leaves the stay-at-home Englishman in the condition of a child who has had his first gaze into a kaleidoscope. Since reading it we have looked through the table of contents. We cull at random such entries as "Shooting Blackskins," "Lynch, a Demon," "Black Snakes *en route*," "Murderous Yellowskins," "Cannibals at elbow," "Kissed by Mrs. Brown," "Gold! gold!" "Kay, the robber chief," "Nearly nipped by Black Bill," "Wreck,-Ruin," "Desperation," "Selling a young woman," and "An idea of Authorship." Tables of contents, we know very well, are sometimes like the alluring pictures outside a travelling menagerie of ferocious lions in the act of devouring their keeper, which resolve themselves inside into a cockatoo and a cage of monkeys. But we can vouch for the honesty of Captain W. J. Barry's synopsis of his book. The heads we have enumerated are fair, though casual, specimens of the horrors and vicissitudes which it has been the fate of the Captain to undergo in his fifty years of colonial adventures.

Captain Barry was born in Cambridgeshire. He says it may be supposed from his name that he is Irish by extraction. We should not have needed the evidence of name to infer it. When he was nine years old he attracted the attention of one Sir John Alcock. Sir John Alcock, being about to undertake a journey round the world, asked the Captain's father, a veterinary surgeon, to let the boy take service with him, and the two sailed in company to New South Wales in 1828. But this first experience of the sea disgusted Barry, and he ran away from Sir John at Sydney. When in danger of starvation he met an old acquaintance of his father's, a wealthy butcher named Smith, who for some small crime had been transported for seven years, but, as was usual in the case of the less criminal convicts, had received a free pardon on arrival. The author neatly calls it "a curious system of assisted emigration." Smith was a specimen of a tolerably large class of pardoned convicts who did well in New South Wales. Another was his friend "Sam Terry," whose greatest grief was that his pardon only extended to the colonies, and that he might not see England once more. In vain he offered to "build a frigate, arm her, and hand her over to her Majesty free of cost." A third ex-convict and millionaire, Bill Nash, returned without leave. That might have been overlooked; but "thinking that money would do anything, he had the impudence to start a carriage and eight, in which he drove in Hyde Park, and upon one occasion actually interfered with the passage of the royal carriage, by being driven in front of the Queen." The carriage and eight made even that worm, the Home Secretary, turn, and "the wealthiest colonist of the day got notice to return to his former haunts, which he did rather hurriedly." While many men like Smith and Terry and Nash became prosperous citizens, multitudes of others had to be treated like wild beasts. Captain Barry "one day in 1830 saw four convicts shot by their soldier guards, when trying to escape into the bush." "It was a common occurrence to see convicts in private service sent from their work for some misdemeanour, flogged, and return with their backs streaming with blood." Of this material bushrangers were made, and the author had dealings with that class as well as with the millionaires. Bushrangers, indeed, were more savage than the savages themselves, and he had early experience of both. Smith, who had trained him to be a good practical butcher, took him to visit his stock stations, on one of which there were 4,000 cattle, and 1,500 horses grazing, and on another 120,000 sheep. While they were at the sheep station the blacks speared two shepherds. The men on the station retaliated by killing "about forty of the black fellows." On a visit Barry paid to another of Smith's stations, the blacks murdered two white women. Twenty stockmen gave chase, and, having driven the savages into a stockyard, slew fifty and burnt their bodies. The Crown prosecutor, Mr. J. H. Plunket, had an un-Irish dislike of reprisals, and brought the men to trial. They were acquitted; but a few days afterwards seventeen of them slaughtered "a very old black fellow, said to be eighty years of age." Mr. Plunket had thus a second chance. "The men were found guilty of the murder of this ancient native, and the whole of them hanged."

But Barry, in spite of the excitement of an occasional boomerang or spear wound encountered in "wiping out a few darkies," and of being "stuck up" by bushrangers, grew tired of driving sheep. Smith, who had a contract for supplying with provisions a new penal settlement, Port Essington, on the west coast, sent Barry to look after his interests. The ship he embarked in had her bottom stove in on a rock. The survivors were put on board another vessel, and that, one stormy night, met the same fate. Barry found himself, when day broke, in company with a man named Winton and a Mrs. Brown, wife of the captain of the second vessel, "lying on the beach, very much bruised and

* *Up and Down; or, Fifty Years' Colonial Experiences in Australia, California, New Zealand, India, China, and the South Pacific; being the Life History of Captain W. J. Barry, by Himself.* London: Sampson Low & Co.

weak, without a vestige of clothing." On the fourth day they killed a seal; with a large flat shell Barry skinned him, and very politely manufactured a garment for Mrs. Brown. All three were taken off by a sealing ship bound for Swan River, and Barry returned, to Smith's astonishment, safe and sound to Sydney. In 1838, when he was nineteen, and already seasoned to adventures, a Mr. Benjamin Boyd came to Sydney to buy land, to cure meat, and to engage in the whale fishery. Barry made his acquaintance; and, "being anxious to see a little more of the world," he accepted from Boyd the post of trading-master to a barque fitted out for a voyage in the Malay Archipelago. The next year he returned to his original allegiance, and went in charge for Smith of four hundred horses which Smith was sending to India. He liked a country where "a palanquin with two bearers could be hired for a whole day for twopence." He also sold his horses to a profit. On a second similar expedition he was less happy, losing in a storm 246 out of the 300 horses originally shipped, and having to drink himself drunk with brandy to keep the cholera out. When it seemed time to go home he represented to himself apparently that the shortest route to Sydney would be by China. Accordingly he accepted a bounty of sixty rupees to go and fight the Chinese. He showed his skill as a butcher on board, and his prowess in being the first, or one of the first two, on the walls of a redoubtable Canton fort. His share in the glory was balanced by a shot in the leg and an ugly gash on the head.

Having had enough of soldiering, he became a stowaway on board a French brig. The French master made use of his services, and then, for no particular crime, gave him sixty lashes. But he absconded at Mauritius, and an Australian trader brought him back to Sydney, after an absence of two years. In this interval his old friend Smith had died, and Boyd became his patron in place of the generous butcher. He went back to his old business of stock-driving, but no business stopped this rolling stone for long. At Sydney, to his great delight, he encountered his French captain and persecutor. Being of that temper that he "always disliked debt," he felt compelled to break several of the Frenchman's ribs with the leg of a public-house table. It became convenient in consequence to leave the colony for awhile, and he tried whaling for Boyd. He had the usual Peter Parley's experiences of being sent flying into the air by a whale's tail, but that adventure only confirmed his liking for the profession. On the next voyage he had command of a vessel, which, after twenty months, landed at Sydney 2,760 barrels of oil, "the voyage being far the most profitable made by any whale ship out of Sydney heretofore." Barry earned thus his title of captain, besides the value of a tenth of 2,760 barrels of oil, at 13*l.* a barrel. The risks of the calling were agreeable to his disposition. But he "must confess he was rather fickle-minded in those days, and is afraid the infirmity sticks to him in his old age." He refused the command of another whaler, and took charge of the shipping of Boyd's meat cargoes. On this service he met his future first wife at Perth in Western Australia. She was the daughter of an old whaling captain, French, and, "eligible young men being probably scarce," took the wooing into her own hands. "Miss French, suddenly looking straight into my eyes, said, 'Mr. Barry, I am going to get married.'" To an inquiry as to the time she replied, "You know that best." The Captain does not give his readers an impression of bashfulness; but he admits that he was, "metaphorically speaking, knocked into a cocked hat." However, he has gallant Irish blood in his veins, and "the next hour was spent in delightful conversation about our future." That happy future was postponed for a few months by the fracture of most of the young lady's ribs, as well as one leg, in a kangaroo-hunt. When the future became present its happiness was fleeting. The bride had 1,000*l.* and 20,000 sheep for her patriarchal portion; but, on her father's death, it appeared that both money and sheep belonged to his brother, who, like other Australian millionaires in this volume, was an ex-convict. Worst of all, the lady's temper showed itself as masterful after marriage as before. She "was becoming dissipated, and was, in fact, going the pace rather fast." As, however, she died in about a year, the Captain is able to look back on his life with her as merely one of too many incidents to leave a very deep impression.

The widower consoled himself by a gold-hunting expedition in California, beginning work at Hang Town diggings; in three months he had amassed 11,000 dollars' worth of gold. He *cached* it at first in salmon tins, but after a time it occurred to him to invest part of his earnings in an hotel and meat-market at Sacramento. He also turned horse auctioneer. Though occasionally there were seven feet of water in the hotel, the gross returns were at the rate of 500*l.* a week. But there was ague to match, and Barry fell ill. So he let his inn for 150 dollars a week, and took a holiday in New South Wales to recruit. When he returned he found his house in ill repute. The New Yorker to whom he had let it had "evidently not been particular as to his customers, as during my absence three men had been shot in it and two taken out of it and lynched." In fact, the Californians had conceived a dislike for Australians, whom they insisted on regarding as, one and all, ticket-of-leave men. The prejudice was unreasonable, but Barry did not think it worth while to fight an uphill battle against public opinion, and sold his interest in the concern for 25,000 dollars. He himself went off to seek his fortune. He became partner in a mule train laden with flour and bacon for Reddon's Diggings, only to find the market glutted at the very moment of his arrival by goods from Oregon. He saw a man having his ears cut off for stealing from a tent. He helped to avenge Indian outrages by worse outrages. He lighted on a new digging in which the whole rock glittered with gold, and in four weeks he had for his own share sixty-one pounds' weight. At another digging, on Salmon River, a party of thirty, including himself, obtained off one bar in the stream two hundredweight of gold, besides profit off their surplus provisions at the rate of ten dollars a pound for salt. Then he transferred his savings from the salmon tins to "Adams's Bank," at Shasta, and joined an acquaintance in a meat-dealing business. At the Eagle Hotel at Shasta, he fell in love with "a young woman from the States." They were married, and though the bride "objected to any fuss," the bridegroom insisted on doing the thing in style, and gave a spread to three hundred guests, which is doubtless remembered in Shasta to this day, and cost 500*l.* According to the Captain's usual ill-luck, at the moment when everything appeared to betoken settled prosperity, a reverse was preparing. Adams's Bank vanished into the bush with 12,000*l.* of Barry's and his partner's earnings. That disheartened him; he sold out his interest in the meat business; was entertained by the citizens of Shasta at a public dinner; took charge of a captive Indian boy; and with him, his wife, one hundred American stoves, the same number of Colt's revolvers, and a baby, returned to Sydney.

At Sydney he bought a ship, and despatched it on a whaling expedition. But he soon got tired of leaving others to do the pleasant work of making money for him, and became partner in a stage-coach business at Geelong. That trade prospered for a time, with the trifling casualty of his capsizing his own coach at a cost of two deaths and a broken leg; but his partners took to drinking, and the firm went into the Insolvent Court. At the same time his ship seized the opportunity to go to pieces on a coral reef. After a decent interval for despair at the collapse of his fortunes, he was on his feet once more, this time as a retail butcher at Ballarat. He was making money by selling saveloys at the public-houses for a shilling apiece when he heard of Brown's Diggings. There, by means of a crushing battery, he accumulated 4,800*l.* He then sold out for a good price. The rumour of the Otago gold fields attracted him. He freighted a ship with horses, and made a good profit on them at Dunedin. Thence he moved towards the mining region. Ready for any opening, he found one at first in fish. He bought two vans, loaded them with a coarse large fish called "habuka," and carried them to Waitatruna. "Some of the corpulent habuka began to smell rather loud"; but he was able to retail them at three shillings a pound. However, he "was truly glad when the last habuka disappeared." After this he took successively to curing hides, to domesticating the wild pigs of the neighbourhood and fattening them for market, to selling neat's foot oil for the cure of chilblains to the miners at half a guinea a bottle, and flour which he had bought at three pounds a bag at twenty-one pounds, and to opening butchers' shops first at one gold "rush" and then at another. Well might the second Mrs. Barry complain that we, or rather he, had "done nothing but travel about since we left California." To please her he established himself as a butcher at Cromwell, in Otago. He sold meat at a fair price, and the grateful Cromwellians presented him with a gold watch and chain, while he in return roasted a bullock whole for their entertainment. So popular did he become, that in 1864 and the two following years he was elected Mayor of Cromwell. A mayoralty was also, if we remember aright, one of the honours of Mr. Micawber's career at the Antipodes. But Captain Barry has been careful in his preface to warn readers against confounding him with that distinguished hero of fiction. Like all great men, the Mayor of Cromwell had his detractors; and his own Council once dared in his absence to censure him. On his return he called a meeting, locked the door, and knocked down the ringleader of the mutineers. Two of the others escaped through the window. The Mayor was fined, but he "still thinks that he took the proper way, if a forcible one, of putting his Councillors straight." He kept up the dignity of the mayoralty in Otago fashion. He rode in a "Hurry-Scurry" race, lent money, broke his ribs off carriages, let miners run up heavy bills for meat, farmed at a loss, bought herds of cattle just before an epidemic of pleuro-pneumonia, and crushed quartz with a yield of barely three ounces of gold, instead of the expected ten. What more could a popular citizen do to prove his public spirit?

But resources began to fail. His position was not improved by a wild-goose chase after a claim to some land grants at Bathurst. These, through the agency of his old friend Smith, had been made out in his name thirty-eight years before; but it appeared they had been resold by the Government under Torrens's Act. He had to return to the scene of his municipal glories to find himself by no means so welcome a person when penniless as he had been in the period of his wealth. He set up as a lecturer on the seductive topics of copper and tin prospecting. Next he tried keeping an hotel; but when his guests did not pay their bills he "could not turn them out." Then his wife died, and his daughter married badly, and he had to give his son-in-law "a considerable taste" of kicking. He himself "was rushed by a wild cow." He assumed the auctioneer's hammer, and in that capacity sold, at her own earnest request, a young lady with a halter round her neck and red hair. "The bids were made with great spirit, until they reached the sum of 175*l.*, at which price the lady was knocked down to a digger named Newton, who handed me 5*l.* deposit, and I gave him the halter, and he and his

purchase walked away to the store together." We are not told into whose hands the money was paid. The sale, he says, paid him very well, though he "nearly got into trouble for this disposal of humanity in a free country." Business, however, was not generally very remunerative, and attendance at race meetings cannot have improved it. In these circumstances "a military man on a pleasure tour through New Zealand" happened to meet him. This gentleman suggested to him that he should write his autobiography. The result is the present queer volume. Incidentally the mother country receives the advantage of the temporary residence in it of a very remarkable colonist. Captain Barry apparently has been occupying his leisure with lectures upon New Zealand prospects. But he is careful to add that he delivers them on his own responsibility, and "not as a paid agent of the Government." Certainly the New Zealand Government must have been very remiss.

FRÉDÉRICK LEMAÎTRE'S RECOLLECTIONS.*

THERE is always something attractive in the title of a book containing the biography or recollections of a great actor. It suggests something of the glamour of the stage mixed with the revelation of green-room mysteries for which young devotees of the theatre constantly pine. The name alone of the great Frédérick calls up at once a host of associations and stories; and from the too slight *Souvenirs* edited by his son, those who have never seen one of the most extraordinary actors of this century can get, or at least fancy they get, some notion of his strange power and amazing variety. The volume contains at any rate several elaborate descriptions of Frédérick's performances by the best critics of the time; and we make no apology for quoting at full length one of them, which is written by a man of genius no less remarkable than that of the great actor. Of Lemaître's acting in *Les Mystères de Paris* Théophile Gautier wrote as follows:—

"Quel admirable acteur! Quel sang-froid et quelle passion, quand, sous le nom de Barbe-Rouge, il vient commander un assassinat au maître d'école; comme il a la parole froide, brève, aiguë! comme on sent bien que c'est la cervelle qui parle au bras! Avec quel calme effroyable, au moment où la victime rend le dernier soupir dans l'allée ténébreuse où l'a poussée le maître d'école, il jette à la poste la fausse lettre qui doit expliquer le crime par un suicide! Et ensuite, quand on le retrouve dans son étude, débarrassé de ses favoris roux, l'air benêt et paterne, l'œil amorti par les lunettes, le dos rond, les mains molles et tremblantes, comme cherchant des papiers par un mouvement machinal, le pas lourd et trainant, on a vraiment peine à croire que ce soit le bandit de tout à l'heure, à l'allure ferme, au poitrail carré, au geste impérieux, hure parmi tous ces groins qui remuent les fanges de la Cité. De quel air attentif, débonnaire et désintéressé il écoute les foudroyantes confidences de la comtesse Sara Mac-Grégor! Avec quelle rouerie de Shylock, quand il avance au pauvre Morelle cinq cents francs dont il a besoin, il emprunte à son clerc Germain les trente-cinq francs qui lui manquent pour compléter la somme! Et lorsque tout le monde est parti, comme il ferme les volets, les serrures, les verrous, pour aller retirer de sa cachette le coffre qui renferme son or! son or! c'est-à-dire tous les vices, tous les plaisirs, toutes les débauches, tous les crimes réduits en petits disques jaunes, rutilants dans l'ombre comme des yeux de lion. Dans ce coffre il y a tout, des chevaux, des palais, des repas splendides, et la vertu des mères, et la pudeur des filles. Aussi avec quelle volupté démoniaque, quel spasme de tigre mangeant une proie vivante, il plonge dans ce bain fauve ses bras d'athlète, devenus aussi nerveux que ceux de Milon de Crotone! Cet or, ce sont les dépôts, attirés par la réputation d'honnête homme qu'il s'est faite, et qu'il ne rendra jamais! Comme, en jetant ses conserves, il a pris subitement une physionomie hautaine, ravagée, effrayante, moitié satyre, moitié Lucifer! A cette transformation soudaine, la salle éclate d'applaudissements. Pour comprendre et rendre ainsi un rôle, il faut plus que du talent, il faut du génie. Quelle puissance de séduction, quelle fascination de serpent, et puis quelle rage, quels transports il déploie lorsqu'il peint à Fleur-de-Marie, dans l'île des Ravageurs, la passion irrésistible, inexorable qu'elle lui inspire! Avec quel accent il lui dit: 'Pour te plaire, je serai bon, humain, charitable, réellement j'aurai toutes les vertus si tu m'aimes!' Et voyant que ses supplications prosternées, que ses adorations de sauvage à son fétiche sont inutiles, comme il l'emporte d'un seul geste, d'un seul bond, en maître, en vainqueur, en homme qui redevient lui-même. Dans la scène de l'*aveuglement*, il atteint aux dernières limites de l'effroi; il est beau et terrible comme Œdipe antique!"

One can almost see the looks and gestures which Théophile Gautier describes with such wonderful vividness, and cannot but feel the influence of the player's commanding power through that of the critic's pen. In another passage, writing of Frédérick's performances in his older days in the *Comte de Saulles*, the same brilliant author said of him and of Mme. Dorval that they were specially the actors of a period passionate to the verge of delirium; and they satisfied its feverish cravings and its fiery outbursts. Dorval was consumed away by the heat; Frédérick yet endured, and the moment he came on the scene of a play, "Voilà que ce drame se met à vivre, à palpiter, à pleurer et à faire pleurer. Un orage y gronde avec éclairs et tonnerre. C'est Frédérick qui passe; des mots s'illuminent soudain, des trouées éblouissantes pénètrent jusqu'au fond de l'âme; tout le cœur se découvre et se révèle dans un soupir, dans une inflexion de voix, dans un geste brusque et découragé." This, it will be admitted, is, apart from the mere beauty of the French, an extraordinarily fine piece of description, which could have been inspired only by extraordinary acting. So long, therefore, as Théophile Gautier's works remain in existence there will be no room for future generations of actors and playgoers to doubt, as profane people sometimes dare to doubt of dead actors whose great reputation rests only on general tradition, whether, after all, Frédérick's acting was anything so very much out of the way. It is the more gratifying to feel sure of this when one is reminded by the editor of the *Souvenirs* of the manner in which Frédérick was treated during his life. Neither he nor Dorval was ever admitted into the Comédie Française. In his old age he was offered an engagement by the direction of the Porte-Saint-Martin, which seemed to assure him peace and comfort for the rest of his days; but "Victor Hugo fut remplacé par Adolphe Dennery et Frédérick Lemaître par l'éléphant du *Tour du Monde*," and the direction quietly left off fulfilling their part of the contract, which unfortunately was not a written one. Then a farewell performance at the Opera House was organized; a crowd of artists pressed forward to proffer their services; M. Cantin, manager of the Folies-Dramatiques, offered an act of *La Fille de Madame Angot*, which was then drawing all Paris. Everything seemed to promise a complete success, until, on the very day of the advertised performance, the bills were torn down and the representation postponed *sine die*. The editor tells us that this was the result of a Minister having been waylaid the night before on leaving the opera by, as the writer says in his anger, "quelques musiciens de l'orchestre, cette meute bruyante, vous savez, qui bourdonne au fond du fossé creusé devant la rampe," who protested against what they called the degradation of being asked to play Lecocq's music. Whether or not this version of the affair is strictly accurate, there certainly seems to be good reason for the great actor's son making an observation which was made some time ago in these columns *à propos* of another French player:—"Ne craignons pas de le dire, et crions-le bien haut, la France ne sait pas honorer ses artistes." It does know how to pay them honour, that is, so long as they can minister to its pleasures; but the moment a voice on whose accents a whole house used to hang begins to fail, critics and public cry, with one accord, "Let us have no more of this!" and fling their once petted favourite away from them as a child flings away a broken toy. The ungenerous treatment of Frédérick was only in degree more remarkable than were the criticisms, one of the worst of which M. Sarcey wrote, made lately on M. Bressant after illness had laid hold of him.

It is, however, pleasanter to speak of the triumphs of the actor's prime than of the troubles which clouded the close of his career. Oddly enough, his irresistible longing for the stage was first determined by a visit to the Ambigu-Comique, which, in 1811, "tenait, avec la célèbre *Madame Angot*, un de ces succès sans précédent qui devaient, à soixante ans d'intervalle, faire la fortune de deux théâtres." He was then eleven years old, and it was after some five years, in the course of which he had some disagreeable soldiering experiences, that he made his first appearance on the stage as the lion in a piece called *Pyrame et Thisbé*, at the Variétés-Amusantes, which in those days was a sort of shrine of that highly artistic pantomime of which we have lately seen a revival, and of which Déburean was then the acknowledged master. Passing his morning in Lafon's class at the Conservatoire, where of course he was instructed in the works of the great classical masters, the young Frédérick came every evening to the Variétés-Amusantes to study "cette science si difficile qui consiste à faire coïncider le geste avec la parole. Si l'on m'a reconnu," he continues, "pendant le cours de ma longue carrière quelques qualités mimiques dans certains de mes rôles, c'est par ce double travail qu'elles furent acquises." It is hardly necessary to call attention to the value of a testimony from so great an actor to the usefulness of what he calls this "double travail"; which is the more important, because observation goes to show that most young actors acquire a command of intonation and facial expression before they learn to be equally at home in the "science si difficile" of suiting the action to the word.

Frédérick's first complete and overwhelming success was obtained in the part of Robert Macaire, and to the history of this strange and fortunate piece of invention on his part it is needless now to refer in detail, since a quotation from the book we are now considering was made by M. Coquelin in his *L'Art et le Comédien*, and requoted in these columns a short time ago. This success was followed by *Trente Ans, ou la Vie d'un Joueur*, and various other pieces, amongst them "*Faust*, a poor translation of Goethe's play, in which the part of Mephistopheles, which was allotted to me, was so hopelessly vapid that I could find nothing better to do by way of giving it weight than to introduce a kind of infernal valse, which I revived later in *L'Auberge des Adrets*." Amongst other pieces of a somewhat later date in which Frédérick played principal parts were M. Hugo's *Lucrèce Borgia* (in which he acted Gennaro) and a play called *Béatrix Cenci*, by the Marquis de Custine, whom Harel, the celebrated manager, fleeced, according to Lemaître, in a shameless way. Indeed, after an interview between the manager and author at which Frédérick was present, he turned to Harel and said, "Vous le laissez partir? Il a encore sa montre!" To *Ruy-Blas* we have referred in the article already mentioned on M. Coquelin's pamphlet; and, passing over other matters, among them an account of Balzac's *Vautrin*, and one even more interesting of how *Mercadet* first came into being, we come to a story of the *reprise* of *Trente Ans*. In this Frédérick, playing Georges de Germany, suddenly saw that Dorval's bonnet-ribbons had caught fire, a fact of which she was ignorant, and plucking it at once from her head, he crushed out the flame and put the wreck of the bonnet in his pocket. The action, which was loudly applauded by those who saw what had happened, passed so quickly that many spectators did not grasp its meaning. Amongst these

* *Souvenirs de Frédérick Lemaître.* Publiés par son fils. Avec portrait. Paris: Paul Ollendorff. 1880.

was a *premier rôle de province*, who exclaimed with conviction, "Voilà un effet auquel je n'avais pas songé"; and, without the great actor's reason for it, he repeated the action when he next played the part on his own stage. The public was completely puzzled, and a subscriber ventured the next day to ask him, "Pourquoi diable, au troisième acte, arrachez-vous la coiffe d'Amélie pour la mettre dans votre poche?"

> "Comment, vous n'avez pas saisi?"
> "Pas du tout."
> "Mais c'est un des plus grands effets de Frédérick!"
> "Ah! c'est un des plus grands effets de Frédérick!" said the awed and astonished subscriber. "Eh bien, je ne m'en serais jamais douté!"

We have quoted, as an enduring testimony to a great actor's powers, what Gautier wrote of Frédérick. We can hardly close our notice more appropriately than by showing how keenly Frédérick could appreciate in another the same kind of power he himself possessed. Writing of Mlle. Georges he says:—

> Georges, à qui, malgré les défauts de la femme, on ne peut s'empêcher de rendre justice comme comédienne, était bien en même temps la personnification vivante du drame et de la tragédie. Douée d'une beauté qui semblait appartenir à cette race dont on a fait les dieux de la fable, elle réalisait l'idéal de la muse tragique, comme, par son organe sonore et profond, son rire impérieux et ironique, son geste fier et hautain, son regard plein de terribles menaces, elle eût été pour Shakespeare la véritable héroïne de ses vastes conceptions. De longtemps on ne reverra une telle Agrippine, une semblable Clytemnestre, pas plus qu'une Marguerite de Bourgogne, une Marie Tudor ou une Lucrèce Borgia qui puisse lui être comparée.

LEROY'S DICTIONARY OF POMOLOGY.*

THE completion of a work of such magnitude and research as M. Leroy's Dictionary of Pomology may well point a moral to English pomologists and English publishers It throws down a challenge to rivals on this side of the Channel, which, however, judging by the past, we are not likely soon to see taken up. But for the death in 1875 of the veteran nurseryman who projected and published these six volumes, of which the latest saw the light towards the close of last year, the work might have gone on to include the whole range of garden fruits in the French and English catalogues; yet, as it is, a work may not unjustly be characterized as exhaustive within its limits which deals with pears in vols. i. and ii., apples in iii. and iv., apricots and cherries, peaches and nectarines, or collectively *fruits à noyau*, in v. and vi., and thus constitutes a sort of library of reference on the history, theory, and practice of pomology. As the first volume was issued in 1867, and its successors have followed at greater or less intervals, it is scarcely within our scope to touch upon M. Leroy's treatment of the subjects of pear or apple culture, which occupy the earlier volumes and the larger half of the work; and we shall speak chiefly of the last volume of this "Magnum Opus." Nothing resembling M. Leroy's Dictionary in scope and extent has appeared in Great Britain; the nearest approach to it in the cognate science of agriculture being, we should say, Stephens's *Book of the Farm*. As a proof of this, we need only point to Dr. Hogg's ample acknowledgments of the labours of M. Leroy and other eminent Continental fellow-workers in the preface to his valuable but comparatively concise and limited "Fruit Manual." Of course it may be pleaded that the physical conditions and climate of France might well inspire the enthusiastic labours of a *vates sacer*; and that, with our comparatively ungenial soil and climate, to write a comprehensive history of fruits and fruit-trees which we can with difficulty coax to fitful and uncertain ripening is very like labour lost. French nurserymen who visited the Hereford Pomological Exhibition of last autumn spoke in high favour of the soil of Herefordshire for pear culture, but ascribed to the sunnier climate of Kent the secret of its victory over the rival orchards of England; though perhaps they left out of account the perseverance, life-devotion, and thoroughness of study and culture, as well as the accessibility of markets, which enable the latter county to develop its resources to the utmost.

It is now twelve years since, in a little work on *Gleanings from French Gardens*, reviewed at the time in these pages, Mr. W. Robinson drew attention to the room for improvement in apple and pear culture of which our country was susceptible, and discoursed with interest and profit to many of our amateur horticulturists on the Cordon system, the improved Espalier system, and the particular form known as the Palmette Verrier. The mention of this last, applied in France, as is also the Cordon, to the peach, brings us to the consideration of this even more especial horticultural product of French soil and climate, exhaustively treated, as we have said, by M. Leroy. Though there is a constant testimony that the Romans received the peach strictly so-called at the end of the reign of Augustus, and named it the "Persicum" from its supposed native country, as is affirmed by Pliny and Columella, the French pomologist goes far to prove that of the fourfold division of this fruit into Peaches, Brugnons, Nectarines, and Pavies, only the first-named fruit can claim such an origin—to wit, the Persicum, which in the middle ages was named Pessicum, whence Pescher or Pecher, and about which clung a fable that the tree, poisonous in Persia, was introduced into Egypt to punish the natives. Dr. Daubeny suggests that the notion arose from a knowledge of the poisonous properties of the prussic acid existing in the peach kernel. It is curious that Columella notes that the "Persica" are "exiguo malo," small fruited (which is the characteristic of peaches ripened in India). It is also noteworthy that the authorities "de re rustica" whom M. Leroy cites contrast the "Persica" with a species of the same fruit called "Gallica," of a more bulky character, of which the flesh could not be detached from the stone. It is clear that he recognizes, as horticulture has done from well nigh time immemorial, the division of peaches and nectarines into freestones and clingstones—*h. e.* "such as have the flesh parting freely from the stone when ripe, or such as have it adhering to the stone when ripe"—the latter being identical with the Pavies, the former with the Brugnons. To the uninitiated these nice distinctions, and even those which discriminate between the peach and the nectarine, may seem trivial, seeing that instances are on record where fruit of both sorts has been produced on the same tree and the same branch. The fourfold division which M. Leroy has established and traced back to the Roman growers and horticultural writers will be less likely to interest the general reader than the scholar, antiquary, or enthusiastic Frenchman, who will like to see it proved that his soil has three parts at least in the *fruits à noyau*—*i.e.* the Gallica, as distinguished from the Persica and the Armeniaca, the Asiatic peaches, and the "Apricots" or "apricocks," derived from "præcox" or "præcoquus," the word applied to the latter by Pliny, Martial, and Palladius. It will amuse the reader to find the nurseryman of Angers diving into the sixth-century bishop and poet of the Gallic Church, Fortunatus, for a notice of some downy peaches which a councillor of Tours sent him as a present, and which he enjoyed so heartily as to incur an attack of indigestion. He also rakes up from the *Acta Sanctorum Ord. St. Benedict.* a legend of a Bavarian knight in Charlemagne's service, who, gathering a peach from the Abbey of St. Denis's orchard, was fain to chastise the gardener who would have stayed his sacrilege; and when, as a punishment, his unruly hand was withered, like Jeroboam's, by a miracle, he showed his gratitude for the renewed use of it by suspending the famous peach "ex voto" in the vestibule, where it long remained to commemorate at once the Divine interposition and the exceptional excellence of Gallic peaches. We could quote other no less curious notices of French peach growth as early as the tenth century.

In Chapter II. (§§ i.-ii.), on ancient and modern culture, M. Leroy commends or controverts divers dicta of Columella or Palladius. Perhaps it was hardly necessary, however, to expose the absurdities of Palladius's notions about grafting the peach or nectarine on the plane, the sallow, or willow, at least with any expectation of growing stone-fruit; or about besprinkling the blossom for three days with goat's-milk to secure bulkier fruit, and writing on a peach-stone with a view to its being replanted to bear an inscribed progeny—a possible contribution to the solution of a riddle in the 3rd Eclogue. A doctor of Paris in 1605 outdid the marvels of Palladius by describing a wonderful peach-tree which bore also grapes, cherries, and oranges on collateral branches. Our author deals with more practical matters when he speaks of the American rivals of France in fruit culture. It is surprising to learn the rapidity with which, after its late introduction in 1680, this "king of fruits," as M. Leroy calls it, took rank as one of the most productive and delicate of esculents for commerce or home consumption. By 1869 there were at least 250 sorts, and now there are many more; the regions most propitious to its culture being Chesapeake, Delaware, and Cape Charles in Maryland, in which there are said to be a hundred million of peach trees. In 1877 three million baskets of fresh peaches were exported thence to other parts of the Republic, though not all to be consumed fresh. Two manufactures of peach and nectarine conserves exist in Delaware and Maryland, besides which a favourite "eau de vie" called "Peach brandy" is made from these fruits. It would seem that the great improvement of the peach cultivation in Germany dates back no further than 150 years, when an impetus was given to it by the example of French industry and perseverance at Montreuil. Our own culture of the fruit, adopted much earlier (perhaps in the tenth or eleventh century), appears to have owed its chief development to the same quarter; and it seems that the Chiswick Gardens are able to number as many as 139 varieties. Undeniably, however, it is to France, and principally to Montreuil, that the growers of the Continent and of America still award the first place in this department of skilled industry. Of that celebrated colony of peach and nectarine growers the fame is in every horticultural work, British or foreign. It was not many years after Arnauld d'Andilly perfected the espalier system at Port Royal that the old musketeer, René Girardot, retired to his estate of Malassis (between Montreuil and Bagnolet, in the department of the Seine), and there became the official founder of what M. Leroy calls a "dynasty of special arboriculturists." There, from that beginning until now, these fruits have been perpetually advancing towards perfection; and there the most apt soils for the peach, and the conditions most favourable to grafting on the almond, the natural stock, or the plum, have been tested and matured. In a pleasant chapter on the uses and properties of this fruit the author cites a Latin rhyming verse:—

> Petre quid est pescha?—Cum vino nobilis esca.
>
> In what esteem hold'st thou the peach, friend Peter?
> Taken with wine a *bonne bouche* to the eater—

* *Dictionnaire de Pomologie, contenant l'histoire, la description, la figure des fruits anciens et des fruits modernes les plus généralement connus et cultivés.* Publié par André Leroy, pépiniériste. Tomes I.–VI. Paris: A. Goin, Librairie Agricole. Angers: André Leroy et ses enfants. 1879.

which seems to imply a reservation as to its healthful properties. In the same chapter, after dilating on the prices of early and late peaches and nectarines in St. Petersburg, in America, and in England, the author goes on to show the title of France to be the true home of these fruits by their abundance and cheapness. Paris is supplied by the departments of Les Bouches du Rhône, La Corrèze, La Dordogne, La Drôme, Le Gard, La Gironde, L'Hérault, L'Indre et Loire, La Nièvre, Le Var; not to speak of Montreuil, whence is derived annually an average of twelve millions, of which the earliest and latest sell at two or three francs each. Here, too, as in America, a large proportion of the produce exercises the artistic skill of the cooks, confectioners, and liqueurists, who make their profit from compotes, marmalades, eau de vie (for which La Grosse-Mignon and La Galande are most recommended), and an appetizing and very digestible ratafia. M. Leroy credits the wood with taking a very fine polish, but even in France the peach tree hardly lives long enough to acquire much bulk.

It may be interesting to compare an example or two of M. Leroy's minute and elaborate description of each peach and nectarine with such a recognized English authority as Dr. Hogg's *Fruit Manual.* Where we have tested the two the former is often the more entertaining, the latter the more concise. Seldom, however, does Dr. Hogg omit any anecdote bearing upon the history of his subject, as may be seen by comparing his account of the Stanwick nectarine with M. Leroy's, where both record the raising of this fruit from stones given to Lord Prudhoe by Mr. Barker, Vice-Consul at Aleppo, and afterwards Resident in Syria. Both note that the seed was sown in March, 1843, the buds inserted the next autumn in a Bellegarde peach, and the first peach produced in 1846. The Stanwick nectarine, so called from a seat of Lord Prudhoe, who had become Duke of Northumberland, was consigned to Mr. Rivers of Sawbridgeworth for propagation, and in 1850 the stock (twenty-four plants) was sold by auction, and the proceeds (164*l.*) presented by the Duke to the Gardeners' Benevolent Institution. Another example of the general agreement of both in details might be found in the account given by the two writers of that very excellent and peculiar late variety of peach, "the Salwey," which in skin and flesh simulates the apricot. The French description is minute and exhaustive; and, if Dr. Hogg's short statement that "it was raised by Colonel Salwey from a peach-stone brought from Italy, and was introduced by Mr. Charles Turner, of Slough," is not improved upon by M. Leroy's version—"qu'il a été gagné par le Colonel Salway d'un semis de noyaux rapportés d'Italie par M. Charles Turner de Slought"—this is only what we might expect; as is also another minor misapprehension of the French pomologist as to the Downton nectarine. With a characteristic shakiness in matters of English geography, M. Leroy says that this nectarine was raised first from a seed of the Elruge and the Violette Hative, by Thomas Andrew Knight, at Chelsea, in the county of Middlesex, "dans la domaine de Downton que possédait Knight." It need hardly be said that Downton is in Herefordshire. But these are small matters, and in no way detract from the value of a really admirable work. No intelligent pomologist, whether grower or amateur, should neglect to furnish his shelves with so thorough a directory to all the *fruits à noyau*, as well as to our more familiar branch of pomology, apple and pear fruits, as that contained in these six volumes at the moderate cost of 30s. It will prove invaluable for reference or comparison.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

CONTENTS OF No. 1,280, MAY 8, 1880:

CONTENTS OF No. 1,279, MAY 1, 1880:

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

HIGHGATE SCHOOL.—EIGHT SCHOLARSHIPS, viz.: Three Entrance Foundation Scholarships of £34 a year (which may be increased to £50 for Boarders), open only to Boys not already in the School. Three Foundation Scholarships of £34 for Boys in the School. Two Gladstone Scholarships of £25 for Boarders only, open to Boys, whether already in the School or not, under Fifteen. Examination, third week in May.—For further particulars apply to the Rev. the HEAD-MASTER, School House, Highgate, N.

SOMERSETSHIRE COLLEGE, BATH.—An EXAMINATION will be held on June 29 and 30, to elect to Seven Entrance Scholarships.—T. M. BROMLEY, M.A., Head-Master.

LEAMINGTON COLLEGE.—There are Three Departments, (1) Classical, (2) Civil and Military, (3) Junior. Honours gained last year include Scholarship at Balliol, Entrances at Woolwich and Cooper's Hill.—Apply to the HEAD-MASTER.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

TOURS, FRANCE.—Rev. C. DOWMAN, LL.B. (Mathematical Honours), late Tutor in Nobleman's family, receives PUPILS for Woolwich, Sandhurst, and Line, and Militia, Universities, and for General Education. Able staff of Masters. Individual attention and careful moral supervision. Very successful at late Examinations. Large house and pleasure grounds. Address, Beau Séjour.

KING ALFRED'S SCHOOL, WANTAGE, Berks.— An Ancient Foundation. Buildings spacious and modern, in a healthy district. Thorough EDUCATION for the SONS of GENTLEMEN. Fees moderate. Boys prepared for Commerce, the Professions, and the Universities.—Address, HEAD-MASTER.

PUPILS prepared for the Universities, Army, &c., by Rev. W. H. ROWLANDSON (late Fellow of Corpus Christi College, Cambridge), Great Braxted Rectory, Witham, Essex.

TUTOR WANTED, to prepare a Youth of Sixteen for the University. A man of good attainments, living in the Country, and receiving only a few Pupils, preferred. State experience in teaching and other particulars to R. W., care of Mr. Williams, Stationer, 55 Moorgate Street, London, E.C.

UNIVERSITY of OTAGO, NEW ZEALAND.—
CHAIR of ENGLISH LANGUAGE and LITERATURE, POLITICAL ECONOMY, and CONSTITUTIONAL HISTORY.

A PROFESSOR for this Chair is now WANTED.

The Salary will be £600 per annum (which will commence to run from the date of embarkation), besides the Class Fees, which are £3 3s. for each Student per term of six months, commencing in May of each year. An allowance of £150 will be made for passage money and outfit.

The age of Candidates should not exceed Forty.

No religious test is required to qualify to hold office in the University or to graduate or to hold any advantage or privilege thereof.

The tenure of office shall be during good behaviour, but in case of the successful candidate becoming incapacitated from age or any other circumstance, a substitute *pro tempore* shall be appointed who shall receive half the salary and the whole of the fees.

The University is also fully equipped with Chairs of Classics, Mathematics, and Natural Philosophy, Mental Philosophy, Chemistry, Mining, Anatomy and Physiology, and Biology.

Applications from Candidates, with seven copies of testimonials, must be lodged with GEORGE ANDREW, Esq., SSC., 3 Hope Street, Edinburgh; or HUGH AULD, Esq., W.S., 21 Thistle Street, there, on or before May 31 next.

Edinburgh, April 28, 1880.

THE GREEN PARK (scarcely two minutes from).—In one of the most élite turnings out of the best part of Piccadilly, a Gentleman's FREEHOLD RESIDENCE for SALE. Arrangements can be made for early possession.—Address, WILKINSON & SON, Estate Agents, Decorators, and Upholsterers, 8 Old Bond Street, Piccadilly, W.

FREEHOLD GROUND RENTS.—CITY of LONDON.—
The COMMISSIONERS of SEWERS of the City of London will meet in the Guildhall of the said City, on Tuesday, the 25th day of May, 1880, at Half-past Twelve o'clock precisely, to receive TENDERS for the purchase of VALUABLE FREEHOLD GROUND RENTS and REVERSIONS of Premises in the Poultry, let on Building Leases, having about eighty years unexpired, viz.:

No. 33	At a Ground Rent of	£675	per annum.
Nos. 31, 35	Ditto	£1,350	per annum.
Nos. 36, 37	Ditto	£1,165	per annum.

Particulars and Plans of the Premises may be had at this Office, together with the Conditions of Sale.

Tenders must be sealed, endorsed outside "Tender for Freehold Ground Rent, No. 33 Poultry," &c. (stating the Premises, as the case may be) and be addressed to the undersigned, at this office, and must be delivered before Twelve o'clock on the said day of treaty.

The Commissioners do not bind themselves to accept the highest or any Tender.

Parties sending in proposals must attend personally, or by a duly authorized agent, at Half-past Twelve o'clock on the said day, and be then prepared (if their Tender be accepted) to pay the required deposit of 10 per cent. on the purchase money, and to execute an Agreement for the completion of the purchase agreeably to the Conditions of Sale.

Sewers' Office, Guildhall: HENRY BLAKE,
April, 1880. *Principal Clerk.*

CONSOLS *versus* GROUND RENTS.—Consols now yield only 3 per cent. and must fall in price; Freehold Ground Rents are quite as secure, pay from 4 to 4½ per cent., and constantly increase in value. Investors and Trustees should apply to Messrs. GEORGE BAKER & Co., Ground Rent Agents, 86 London Wall.

ENGLAND to AUSTRALIA in FORTY DAYS.
ORIENT LINE.

The following or other magnificent full-powered Steam Ships belonging to the ORIENT and PACIFIC STEAM NAVIGATION COMPANIES, are despatched every FORTNIGHT for ADELAIDE (Semaphore), MELBOURNE, and SYDNEY direct, taking Passengers at through rates to all the principal ports in Australia, Tasmania, and New Zealand.

	Tons.	H.P.		Tons.	H.P.

GARONNE	3,876	550	SORATA	4,014	600
JOHN ELDER	4,152	550			

These Vessels are specially constructed for long Ocean voyages, and are fitted with every convenience for the comfort of passengers.

Fares from 14 Guineas upwards.

For further particulars apply to the Managers of the Line, F. GREEN & CO., and ANDERSON, ANDERSON, & CO., Fenchurch Avenue, London, E.C.

HOTELS.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.
BENJN. BULL, *Manager.*

THE ILFRACOMBE HOTEL is on the Sea Shore. It contains 250 Rooms, and is a model of sanitary excellence. Table-d'hôte daily. Two Months' Tourist Tickets from all principal Railway Stations in England.—Full information of MANAGER.

TOTLAND BAY, ISLE OF WIGHT, NEAR ALUM BAY.

TOTLAND BAY HOTEL.—Magnificent Sea Views. WILL OPEN at Whitsuntide. Comfort with moderate charges. Billiard-room and Tennis-lawn. Bracing air; excellent sands and promenade Pier. Good anchorage for yachts. Apply to Miss FLEMING, Manageress, late of the Langham Hotel.

BADEN-BADEN.—FRIEDRICHSBAD. Model Establishment, combining elegance and comfort, with the most modern contrivances. Renowned Thermal Springs; chief mineral constituents—sulphate of lime, chloride of magnesia, and chloride of lithium, the latter effective in gouty cases. Russian vapour baths, Roman-Irish baths, Turkish baths; cold water treatment, inhalation rooms, pneumatic apparatus. The Assembly Rooms of Baden-Baden are unrivalled in Europe. Cool spot in summer.

THE MULTIPLEX COPYING PROCESS gives Forty Copies of Circulars, Music, Drawings, Plans. This Process has been adopted by Her Majesty's Government, who have paid the Inventor (Mr. FELLOWS) £500 for the privilege of using it throughout all their departments. No tedious washing off. Suits all climates. Negatives available for years. Full particulars post free.—CHARLES FELLOWS, 5 Tettenhall Road, Wolverhampton.

DENT'S WATCHES, CLOCKS, and CHRONOMETERS.
Illustrated Catalogue sent free.
Apply to 61 STRAND, or 34 ROYAL EXCHANGE, LONDON.

LIFE ASSURANCES, &c.

CLERICAL, MEDICAL, and GENERAL LIFE ASSURANCE SOCIETY,
13 ST. JAMES'S SQUARE, LONDON, S.W.
CITY BRANCH: MANSION HOUSE BUILDINGS, E.C.

Distinctive Features.

CREDIT of half the first five Annual Premiums allowed on whole-term Policies on healthy Lives not over Sixty years of age.

ENDOWMENT ASSURANCES granted, without Profits, payable at death or on attaining a specified age.

INVALID LIVES assured at rates proportioned to the risk.

CLAIMS paid thirty days after proof of death.

Bonus.

The REVERSIONARY BONUS at the Quinquennial Division in January 1877 (amounting to £357,011) averaged 50 per Cent., and the CASH BONUS 30 per Cent., on the Premiums paid in the five years.

The NEXT DIVISION OF PROFITS will take place in January 1882, and Persons who effect NEW POLICIES before the end of June next will be entitled at that Division to one year's additional share of Profits over later Entrants.

Report, 1879.

The Fifty-fifth Annual Report, and the latest Balance Sheets rendered to the Board of Trade, can be obtained at either of the Society's Offices, or of any of its Agents.

GEORGE CUTCLIFFE,
Actuary and Secretary.

EQUITABLE LIFE ASSURANCE SOCIETY,
ESTABLISHED 1762.
MANSION HOUSE STREET, LONDON.

The Oldest Life Office on the Mutual System in the World.

The Invested Funds of the EQUITABLE are upwards of £4,000,000, being more than 20 times its renewal premium income.

The recent division showed a clear surplus of £1,893,700, after providing for all future claims.

The effect of the distribution was to make a total addition of 257½ per cent. to Policies taken out in 1817, of 172½ per cent. to Policies taken out in 1827, of 135 per cent. to Policies taken out in 1836, of 101½ per cent. to Policies taken out in 1846, of 74 per cent. to Policies taken out in 1856, of 31½ per cent. to Policies taken out in 1866, and 10 per cent. to Policies taken out in 1874.

The addition to Policies taken out in 1861 was sufficient, if so applied, to extinguish all Premiums payable during the next ten years; whilst Policies taken out in 1856 could also extinguish their Premiums in like manner, still retaining an increasing bonus of 40 per cent. on the sums originally assured.

Premiums may be paid in one sum, or for a fixed period, so as to cease after a given number of years.

The whole working expenses of the Society average about 2½ per cent. on its gross annual income.

It has never allowed commission or employed agents, whereby more than £2,000,000 have been saved to the assured.

J. W. STEPHENSON, *Actuary.*

IMPERIAL FIRE INSURANCE COMPANY.
Established 1803.—1 OLD BROAD STREET, E.C.; and 22 PALL MALL, S.W.
CAPITAL, £1,000,000. PAID-UP and INVESTED, £700,000.

No. 1,281, Vol. 49. May 15, 1880. [Registered for Transmission abroad.] Price 6d.

MR. GLADSTONE'S APOLOGY TO AUSTRIA.

IMMEDIATELY on the formation of the Government two of its members have had to make public apologies. Mr. FAWCETT's case was in one respect worse than Mr. GLADSTONE's, because the unjustifiable statement which he was forced to retract had been made since he became a Minister. Even if his charge against the late Secretary of State for India had been well founded, he ought not to have anticipated the judgment of Parliament, and the action of his own colleagues, by appealing directly to a popular meeting. His apology was ungracious in the insinuation that Lord CRANBROOK and Mr. STANHOPE ought to have suspected the miscarriage which he had previously accused them of deliberately suppressing. It is fair to admit that Mr. FAWCETT is not ordinarily deficient either in prudence or in good feeling. Experience will soon teach him that the true official attitude is one of reserve, if not of defensive caution. His late indiscretion was personal or peculiar to himself, and he cannot be said to have damaged the Government. Mr. GLADSTONE's letter to Count KAROLYI, or rather the occasion of its appearance, is humiliating to the country as well as to himself. It may have been better to express contrition than to persist in an indefensible foreign policy; but it is not satisfactory that one of the earliest State papers of the new Cabinet should contain an acknowledgment of error, of discourtesy, and of injustice. It is surprising that Mr. GLADSTONE should condescend to draw a contrast between his present responsibility and the comparative freedom which he professes to have enjoyed before he became Prime Minister. Such a distinction might be reasonable in the case of an ordinary member of the party who, perhaps beyond his expectation, now finds himself an Under-Secretary or a Lord of the Treasury; but Mr. GLADSTONE, long before the election, had resumed the rank of leader of the party, and he always explained and justified the violence of his language by the depth of his convictions. He again and again denounced the Ministry which was then in power as the worst and wickedest of modern times, mainly on the ground of its foreign policy. At the time he would have rejected with contempt the excuse that he was not officially responsible for his opinions and his language. Within a few days he has informed his constituents that he will redeem all the pledges given during his canvass, and he makes no exception as regards the foreign policy which he recommended. Even if he had not resolved before the election to place himself at the head of the Government, he must have intended to impress his policy on any Liberal Ministry which might be formed. The attacks on Austria which are now publicly disavowed or withdrawn were repeatedly and deliberately made, in spite of constant remonstrance and warning. Similar charges advanced two or three years ago in the House of Commons had been received with disapproval by the more judicious members of his own party. It was therefore known that Mr. GLADSTONE's expressions of enmity to Austria during his Scotch oratorical circuit were not attributable to temporary irritation or caprice. His early hostility to the Power which formerly resisted Italian freedom and independence combined itself with more recent jealousy of the possible antagonist of the supremacy of the Greek Church and the Slavonic race. Having never concerned himself with foreign affairs except under occasional impulse, he seemed to have forgotten that the Austro-Hungarian monarchy is not in its institutions or its tendencies the same with the Austria of METTERNICH. Mr. GLADSTONE's unmeasured language produced the unusual result of a temperate and dignified protest addressed by the EMPEROR himself to the English AMBASSADOR. No occasion could have been more favourable for a courteous and respectful explanation, and for a discontinuance of unseemly vituperation. Mr. GLADSTONE, having seen in some newspaper an inaccurate report of the conversation between the EMPEROR and Sir [illegible] ELLIOT, replied in the same pugnacious and contemptuous tone which he might formerly have used to Mr. DISRAELI in a House of Commons debate. He once more asserted that Austria had never interfered in European politics for good, although no other Power has so often or so long been the intimate ally of England. That, next after England, Austria was the most constant and most formidable enemy of NAPOLEON may perhaps in Mr. GLADSTONE's judgment not have been a merit. His latest phrase in the Midlothian declamations was the singularly offensive formula of "Hands off." Assuming that Austria threatened the independence of Bulgaria and the progress of East Roumelia and the provinces still subject to the SULTAN, he intimated, in terms of rude menace, that the English Liberal party, then about to succeed to office, would not tolerate aggressions which have not been attempted or proposed.

It may perhaps not be proper for the FOREIGN MINISTER to accede to a motion which is to be made in the House of Commons for the production of Count KAROLYI's letter; and it appears that some of the communications were oral. There can be no doubt that Mr. GLADSTONE's acknowledgment of the courteous tone of the document is [illegible] deserved; but it is much to be regretted that such [illegible] communication should have been necessary. It [illegible] a drawback from Lord PALMERSTON's statesmanlike and diplomatic qualities that he made many [illegible] in foreign Courts and Cabinets; but during his [illegible] years' direction of international affairs he never exposed himself to such a censure as that which has been administered by the Austrian AMBASSADOR to Mr. GLADSTONE. In 1846, when the return of his party to office was imminent, Lord PALMERSTON paid a visit to Paris for the express purpose of removing the personal [illegible]udice which he had provoked on the part of the French [illegible]G and his Ministers. He had repeatedly thwarted their [illegible]igues, and he had sometimes not sufficiently concealed his opinion of their conduct; but he had never in or out of office been guilty of the indiscretion of publicly attacking the French [illegible] or its Government. After a short stay he returned to England with the certainty that his resumption of the [illegible] of the Foreign Office would not produce any unfriendly feeling on the part of France. Mr. GLADSTONE [illegible] little or nothing from a chief whom he never [illegible] liked or zealously supported. He might advantageously have accepted Lord PALMERSTON's favourite principle [illegible] among great States there was no room for liking or [illegible]liking, and that foreign policy could not be reduced to [illegible] system. France or Russia was to be opposed in attempts to disturb the peace and equilibrium of Europe; but Lord PALMERSTON was ready to co-operate with either Power in the attainment of objects which he thought desirable. Perhaps Mr. GLADSTONE himself has now at last become a convert to Lord PALMERSTON's doctrine, since he has suddenly discovered in himself a feeling of respect

and good will to Austria. The position of a suppliant for pardon is so awkward that Count Karolyi will probably excuse a passage in the letter of apology which, however ill-timed, cannot have been seriously intended to give offence. Mr. Gladstone accepts the Ambassador's declaration that his Government has no design of advancing in the direction of Salonica, and that an accession of territory would be inexpedient and unacceptable. If the assurance had been given earlier, Mr. Gladstone would, he says, not have used the language which has given rise to just remonstrance. The object of an unfounded charge is not bound to have anticipated an unprovoked attack by an assertion of his own innocence. When Mr. Gladstone exclaimed "Hands off," he ought to have been prepared with proof that there was a design of laying hands on a coveted territory. He adds the obscure statement that he had relied on secondary evidence, not from hostile sources and not of his own seeking. The application of a technical epithet to political information is not a little puzzling. Secondary evidence, though it is subject to restrictions in English courts of justice, may often be sufficient to determine the policy of a statesman. It was Mr. Gladstone's duty, in Midlothian as in Downing Street, to speak the truth, and, as a preliminary condition, to know what was true. It is no excuse for a misstatement that there has been no previous contradiction. Perhaps the most important moral to be derived from a mortifying incident is that delicate questions of foreign policy ought not to be discussed for party purposes before a popular audience. A Radical Scotch mob has no hesitation in applauding abusive language against a Government of which it knows nothing; and it cares little for the impediment which may probably be offered to friendly concert and co-operation.

Lord Granville would willingly have dispensed with an unwelcome appendix to his Circular, but it may be hoped that the common action which he invites will not be refused. The Porte, which, among other faults, has all the vices which belong to weakness, may perhaps find a certain support in the joint demand of the Great Powers that it should comply with its undoubted obligations. Almost any settlement of the Greek frontier question would be preferable to an indefinite adjournment, and it would relieve the Turkish Government from the burden of protecting the disputed territory. It is doubtful whether means can be found for coercing the Albanian insurgents, who appear to be more than a match both for the Turkish troops and the Montenegrins. The suggestion that an Italian army might be sent to restore order is for many reasons inadmissible. It will probably appear that there are other clauses of the Berlin Treaty to be enforced, in addition to those for which the Porte is held responsible. The Governor-General of East Roumelia permits or encourages systematic persecution of the Greek and Turkish population. The Bulgarians are perhaps not sufficiently attached to the independence which awakes the passionate sympathy of Mr. Gladstone. It is not Austria alone which must be warned to keep "hands off." The Prince of Bulgaria has lately returned from St. Petersburg with the rank of Lieutenant-General and of Aide-de-camp to the Emperor; and the number of Russian military officers in the province is constantly increasing. The Circular will have one good effect in satisfying Germany and Austria that the present Ministers meditate no sudden or violent departure from the policy of their predecessors. The respect of European statesmen for English agitators of high political rank will not be increased; but it may be presumed that the language of the Circular is calm and courteous, and fortunately Lord Granville is not personally responsible for the mischievous rhetoric which may have been mistaken for a serious political scheme. His vicarious suffering for Mr. Gladstone's error must have been severe, when he was forced to begin his first official interview with the Austrian Ambassador with a disavowal or retractation of the wanton impropriety committed by his chief.

THE AFGHAN WAR ESTIMATE.

The new Postmaster-General has yet to learn the lesson expounded with such lucid frankness in his Chief's letter to Count Karolyi. A high officer of State no doubt does well to resolve neither "to repeat nor "even defend in argument, polemical language used "individually in a position of greater freedom and less "responsibility"; but Mr. Fawcett has begun his official career with a blundering calumny worthy of the most reckless hour of Opposition; and even in his grudging apology he half repeats the charge which the facts of the case rendered it necessary to retract. A few lines to Lord Hartington would have enabled him, before launching at the late Government an accusation as serious as ever one English statesman brought against another, to ascertain its truth or falsehood; but Mr. Fawcett preferred to trust "solely to information received before the late Government "resigned"; and his audience at Hackney were no doubt perfectly content to take on trust any demonstration of Conservative turpitude which their member was able to produce. The officials of the India Office, and especially Mr. Stanhope, must feel obliged to their unchivalrous antagonist for an opportunity of putting their conduct as honourable gentlemen beyond dispute; but Mr. Fawcett's leaders have probably ere now seen reason to remind him that baseless accusations, wantonly made and ungenerously retracted, are not calculated to strengthen the confidence of the educated classes in the new Administration. Lord Hartington will not, it may be expected, be anxious for the assistance which Mr. Fawcett, with such patronizing alacrity, announced that he was willing to give him in the administration of India. Mr. Fawcett's zeal is commendable, and his ignorance of Indian affairs is less intense than that of many Englishmen; but Lord Hartington is well aware that one of his chief claims to the regard of his countrymen is his incapacity to descend to the demagogic vulgarities which not even the dignities of office have enabled Mr. Fawcett to discard.

It is now beyond dispute that the India Office did not learn the altered financial position in India until after the dissolution of Parliament and almost the close of the elections. Not only did the telegram of the 13th of March not "explicitly reveal the grave crisis," as Mr. Fawcett admits, but there was nothing in it to suggest the likelihood of any such crisis; it referred merely to a discussion which had for long been on hand between the two Governments, as to the amount of the Secretary of State's weekly drawings—a matter which, it is well known, has frequently to be reconsidered with reference to its immediate effects on the money-market. So far the question is interesting only as it affects the good faith of the late Government; but the wider issue raised by Mr. Fawcett is of Imperial importance. Is it true, as he appears still to insist, that the recent intelligence from India has "completely cast to the winds the "prosperity Budget"? If so, the measures necessitated by the recent discovery must go far deeper than the reform of a department, the improvement of the account machinery, or the removal of an incompetent official. Some or all of these measures are, on the face of the matter, essential. A finance system under which a Minister so able and experienced as Sir John Strachey is liable to be misled on a wholesale scale fails in one of its principal objects, and calls for searching inquiry into defects which to so large extent impair its usefulness. The forms of Indian account, however, have been prepared by English financiers of high position, and are not ordinarily supposed to be deficient in checks on expenditure or the means of estimate. The experience of the former Afghan war has proved that there are very special difficulties attending the supervision of military outlay in a country such as Cabul, where a large number of officers, most of them unfamiliar with accounts, are necessarily entrusted with the use, practically unfettered, of public funds. If an officer is desired to place his force, *coûte que coûte*, in a specified position, he will have to pay for carriage and commissariat exactly what the exigencies of the occasion enable the suppliers to extort. Prices in India, moreover, are liable to enormous fluctuations, and it is conceivable that in this way the military accountants may be able to justify a part of their miscalculation. Another possible explanation is that, in the course of the campaign, the Viceroy, dissatisfied with the existing commissariat arrangements, placed a single officer in charge of this department, and armed him with an absolute dictatorship. Sir Michael Kennedy's proceedings in the discharge of this important duty are known to have been exceptionally vigorous; they must have largely enhanced the expenditure at numerous points; and it is not unlikely that, with a view to expedition, the ordinary

routine of audit may have been departed from, and considerable outlay thus escaped notice for the time. The fact that the miscalculation was so speedily discovered shows that the department, though perhaps too cumbrous and slow in operation, does not, in the long run, fail to do its work. Nor did Sir JOHN STRACHEY profess to be dealing with more than conjectural figures. "The military "estimates," he expressly warned his hearers, "must "of course be to a great extent speculative," and though on the figures then before them the Government did not think it necessary to enter a loan on the Estimates, the likelihood of such a necessity was distinctly intimated, and the Government "emphatically reserved to itself the "freest discretion to raise, during the year, any loan which "actual events may render necessary." "Loan trans-"actions," Sir JOHN STRACHEY added, "are habitually "presented with expressed reserve, and this reserve must "be understood to be this year greater than usual." The wisdom of this reservation was shown more speedily, no doubt, than the Finance Minister expected; in the meanwhile, it is surely no unforgiveable offence to have so far accepted an avowedly conjectural estimate as to refrain from borrowing until the necessity for a loan was proved.

As to the general question of the soundness of the financial position in India, it is natural enough that Mr. FAWCETT should welcome an opportunity of justifying views which practical experience has shown to be erroneous. He has again and again declared that the country was being imperilled by financial mismanagement, that a day of stern reckoning was at hand, and that England would have soon to deal with the bankruptcy of an Empire. He will no doubt convince himself, and endeavour to convince others, that what he is pleased to call the present "grave "crisis" is a fresh illustration of the truths which he has so persistently enforced. But how far is this the case? The resources of India sufficed in the year 1878-9 to provide three-quarters of a million for "war," 313,000*l.* for famine, and a surplus of 2 millions; they sufficed in 1879-80 not only to defray the expenses of the war—3½ millions—and to spend 99,000*l.* in famine relief, but to meet an outlay of 1¾ million on strategical railways, designed not only with a view to the present campaign, but for the permanent protection and profit of our North-Western frontier. Besides this, there was a balance of 119,000*l.* During 1880-81 2½ millions more will be spent upon the frontier railways, and this sum, in addition to nearly 2½ millions of war expenses, can be met out of the revenues of the year, and still leave a surplus of 417,000*l.* It results, therefore, that the income of India for the three years, 1878–79, 1879–80, and 1880–81, has been more than 13 millions in excess of ordinary expenditure. Assuming the war to cost 6 millions in the present year, and thus to involve a total expenditure up to the close of 1880–81 of 10 millions, the whole of this can be met out of current income, and a balance of three millions on the three years' transactions would yet remain. The idea of defraying the cost of the strategical railway system out of annual revenue would of course never have been suggested but for the extraordinary prosperity of the last three years; but as the object of the Famine Insurance Fund was either to diminish existing debt or prevent an increase of debt which would otherwise be inevitable, the employment of the annual surplus on these works, supposing it to be available, would have been strictly logitimate. Now that it is shown that the war expenses of the present year will exhaust the available surplus, the money for the strategical railways must be found elsewhere. But there has never been any doubt that these railways ought to be made, and their construction out of borrowed capital is entirely unobjectionable. Ignorant or unscrupulous assailants of Sir JOHN STRACHEY have frequently declared that his "famine "surplus" has disappeared. As the object of his arrangements was to establish an annual margin of two millions of ordinary income over ordinary expenditure, it is obvious that it has been accomplished with more completeness than its author could have hoped.

These figures appear to us to establish a position which Mr. FAWCETT and those who draw their inspiration from his speeches would do well to study. Most of them are matters of account, formally audited and beyond dispute. They harmonise with the experience of the last decade, which, as any one who will take the trouble to peruse the Budget speech may see, shows an average annual balance of [illegible] millions of ordinary income over ordinary expenditure. A writer in the *Spectator*, who does not, apparently, include a perusal of the document criticized among the requisites of conscientious criticism, denounces "the "preposterous system under which an Indian Budget "covers four years—the revised actuals of 1878, the actuals "of 1879, the partly estimated accounts of 1880, the anti-"cipation sketch estimate of 1881." He and his readers will be surprised to learn that the whole of this account is an absolute figment of the writer's imagination. No such preposterous system exists. The Indian balance-sheets exhibit the closed and audited account of the past year; the account, closed but for two months, of the current year; an estimate of the income and revenue of the year about to come. They will of course mislead those who look at them as carelessly as did Mr. GLADSTONE; nor is it probable that they will enlighten persons who, like the writer in the *Spectator*, are ignorant of their very outline. But so far as the general arrangement goes they are simplicity itself, and to those who care enough about India to study them with attention they supply ample ground for believing in the substantial prosperity of the country and the marked success of its financial administration.

TURKEY.

MR. GOSCHEN will probably do all that can be done at Constantinople; but whether he can do anything remains to be seen. Sir HENRY LAYARD has never been wanting in activity and vigour, and for a long time past he has, under the instructions of his Government, applied to the Porte and to the Palace incessant pressure. The Ministers who had succeeded to office during his temporary absence have proved even less amenable than their predecessors to warning and remonstrance; while the SULTAN, who retains in his own hands a large share of arbitrary power, scarcely disguises his impatience of foreign interference and control. No effectual measures have been taken for the removal of fiscal abuses, or for the protection of the peaceable communities which suffer from official oppression, and, in the Eastern provinces, from the rapacity and cruelty of Circassian exiles and Kurdish marauders. There is no proof that the perverse obstinacy of the SULTAN and his Ministers has on this occasion been caused or encouraged by Russian intrigue. The impediments which have been offered to the due punishment of a ruffian from Bosnia who murdered a Russian officer indicate an impartial antipathy to all Christians and foreigners. No serious efforts are made to avert or relieve the terrible famine which has broken out in parts of Asia Minor and Armenia; but military preparations have been made for the suppression of the disturbances which will certainly ensue. The English AMBASSADOR is not responsible for the failure of his endeavours, and the Consular agents in the Asiatic provinces have constantly furnished him with abundant materials for advice and complaint. The results of the Russian war have been disastrous to the subjects of a Government which was always weak and vicious, but which has never before been reduced to its present condition of helplessness. The SULTAN at the same time shares and dreads the fanaticism of the Mahometan population. Even the protection which he has hitherto afforded to an obscure assassin is plausibly attributed to his fear of resentment on the part of Bosnian soldiers, who form a part of the guard of the palace. Neglect of the counsels of foreign Ambassadors, though it may end in the overthrow of the Empire, at least involves no immediate danger to his person.

The Government is well advised in despatching on a special mission to Constantinople a representative of high political rank who will enjoy the fullest confidence of the Cabinet. Mr. GOSCHEN will perhaps not find occasion for the exercise of his financial skill and knowledge, inasmuch as he will not bring the aid of English credit to a bankrupt Treasury; but the SULTAN and his advisers may perhaps listen to an Envoy who will be supposed to bring with him a new policy. Mr. GOSCHEN himself has during the long Eastern controversy maintained for the most part a judicious silence. He is not supposed to have approved Mr. GLADSTONE's one-sided violence, and, on the other hand, he gave no active support to the late Government. While he is not known as an enemy of Turkey, he will speak in the name of a Cabinet which will make no additional sacrifices for its preservation. Only a few months ago a Turkish Minister insolently suggested to Sir HENRY LAYARD that his urgency for the reform of the administra-

tion was affected for the purpose of influencing the elections in England. It is now understood that a powerful section of the dominant Liberal party is indifferent, if not hostile, to the maintenance of the Ottoman Empire. Whatever may be thought of the expediency of reversing the ancient national policy, possible or imminent alienation may not improbably serve the purpose of a diplomatic weapon. There is no doubt that the Turkish Government has frequently relied on the supposed interest of England in the maintenance of the Empire. Its late obstinacy and unfriendliness are in some degree the result of disappointment at the refusal of support during the war, and of financial assistance at a later period. Mr. GOSCHEN will perhaps appeal rather to the fears of the SULTAN than to his hopes, yet his mission is so far friendly that he will make no demand which would not be for the benefit both of the Turkish people and of the Government.

In entering on the administration of foreign affairs Lord GRANVILLE has been fortunate in an opportunity of acting in concert with all the Great Powers. Their Ambassadors, including the representative of Austria, concurred in Sir H. LAYARD's protest against the incapacity or bad faith which has prevented the settlement of the Montenegrin frontier question. The fact that armed Albanians are in possession of the districts which were to be ceded by the Porte to Montenegro has not been excused to the satisfaction of the Powers. The commander of the Turkish troops evacuated the territory before the appointed time, and without giving due notice to the Montenegrins. It is possible that he may not have been strong enough even to hold his position. Some of his men were Albanians who have since joined their countrymen; and his remaining force is insignificant. The report that the Albanian League has declared its independence of the SULTAN is contradicted, but it is more than doubtful whether he is able to enforce his authority. There may perhaps be no reason why the national rights of the Albanian tribes should not be as fully recognized as those of Bulgarians or Montenegrins; but the Treaty of Berlin contained no stipulation in their favour, and the Turkish Government is at least technically responsible for the acts of its nominal subjects. In an elaborate memorandum the Turkish Ministers affected to prove that the evacuation had been executed with punctuality and good faith. The Ambassadors unanimously reply that the statement is not satisfactory; and they further demand that the Turkish forces shall reoccupy the ground, and that they shall secure a free entrance to the Montenegrin garrison. It is uncertain whether Turkey will be either able or willing to comply with the demand. The Albanian force is said to amount to some thousands of men, with a proportion of artillery; and the Christian and Mahometan tribes appear for once to be united. Foreign Powers, not having recognized the Albanians, can deal only with the Turkish Government.

The not less perplexing alteration of the Greek frontier will possibly at last be arranged. In this case also there is an Albanian element to be considered; and the Turks can scarcely be expected to give armed assistance to an unfriendly neighbour against claimants who perhaps still profess allegiance to the SULTAN. The reasons of the long delay which has taken place are imperfectly understood, for the alleged backwardness of the late English Ministers affords neither a certain nor a sufficient explanation. The Turkish negotiators might be excused for pursuing their usual policy of delay. They could not be expected to appreciate the claim to an accession of territory which was founded on abstinence from unprovoked invasion during the Russian war. The neutrality of Greece was due as much to the fear of Turkish superiority at sea as to the remonstrances and assurances of the English Government. At Berlin the Greek agents perhaps relied too exclusively or too ostentatiously on the patronage of France; but during later negotiations all the Powers appear to have been equally tolerant of procrastination. It is uncertain whether Mr. GLADSTONE and Lord GRANVILLE propose to support the claim of Greece to the acquisition of Janina. The opinions which may have been expressed by the UNDER SECRETARY of STATE before his accession to office afford no clue to the present intentions of the Government. The feud between the Greeks and Bulgarians, which has lately revived with increased acrimony, may possibly have suggested to the Turks the expediency of conciliating the less unfriendly neighbour. It is believed that Austria, which has never cordially supported Greek claims, offers no impediment to an early conclusion of the controversy; and the French Government, though it may have relaxed its efforts, will favour the extension of Greek territory. The Emperor of RUSSIA has on all occasions professed to support the demands of Greece, although the Slavonic races are more direct objects of his protection. If all the Powers are agreed, not only on the immediate settlement of the dispute, but on the details of the frontier line, which have been abundantly studied and discussed, one possible cause of war ought to be finally eliminated. There is no reason to suppose that Lord GRANVILLE sympathizes with Mr. GLADSTONE's enthusiasm for the inhabitants of the provinces which have been wholly or partially detached from the Turkish dominion. He will at least not attempt to extend or alter in their favour the provisions of the Treaty of Berlin; and the Austrian Government has judiciously consented to forget a wanton rhetorical challenge. Whatever may happen hereafter, there is for the time no question of an Austrian advance to the South; and, on the other hand, Bosnia and Herzegovina must be content to defer any aspiration to alliance with Montenegro or Servia or East Roumelia. Mr. GOSCHEN will scarcely be able to provide a remedy for the disorders which result from the war and from the subsequent arrangements. The cruelties which are perpetrated on the helpless Turks in Bulgaria, the outrages which are committed by roving Mussulman bands in Macedonia, could only be suppressed by a strong and honest Government, which is to be found neither in Turkey nor in the newly-established Principality. Probably the instructions under which Mr. GOSCHEN will act may relate rather to Asia than to Europe. The present Ministers may be expected to rely on the Treaty of Berlin in preference to the separate convention between England and Turkey; but in any attempt at concerted action they will be confronted with the difficulty of inducing any Power except Russia to take an interest in the administration of Armenia and Asia Minor. It might be possible, but scarcely expedient, to obtain the intervention of France in Syria, which was reluctantly evacuated by NAPOLEON III. in deference to the urgent demands of Lord PALMERSTON. It was probably for the purpose of excluding the action of either Power, and more especially of Russia, that Lord BEACONSFIELD negotiated the subsidiary convention which still needs a satisfactory explanation.

MR. BRIGHT AND FOREIGN OPINION.

IT is impossible to converse with that intelligent foreigner whose opinion on the late political crisis has been so often invoked without perceiving that there is one of the new Ministers whose presence in the Cabinet makes more impression on him than even the Premiership of Mr. GLADSTONE. The PRIME MINISTER has declared his views on all public questions in a hundred speeches and writings, and, if he is misunderstood, it is not for want of material. But Mr. BRIGHT is the symbol of a policy which out of this country is regarded as in the highest degree mysterious. He belongs to history; and in the view of the instructed foreign observer he is still the Mr. BRIGHT who was Mr. COBDEN's friend and colleague from 1840 to 1855. A great deal has happened since then in this country which enables us to form a judgment on Mr. BRIGHT; but abroad he remains the public man who, next to Mr. COBDEN, did most to overthrow the most powerful Government of its time by converting its chief to new opinions, and who immediately afterwards endeavoured to popularize the doctrine which was no doubt inaccurately described as "Peace "at any price."

Perhaps we have never in this country sufficiently appreciated the deep sensation created throughout Europe by the rise and fall of Sir ROBERT PEEL's Government. The political calamities which befell the English Tory party in 1831 and 1832 had corresponded to the dethronement of the older branch of the French BOURBONS; and the return of a strong Conservative Government to power under PEEL had seemed to answer to that restoration of political authority in France which LOUIS PHILIPPE prematurely boasted that he had effected. The form of opinion which had governed Europe since the end of the great war at the beginning of the century appeared to have revived in both countries in a modernised shape. What followed in England was even more surprising than the events which happened three years later in France. The

success of a Parisian street revolt in 1848 was intelligible; there had been plenty of precedents for it within the memory of living men; but in this country a powerful Minister had succumbed, not to popular discontent, but to the force of conviction, and the agents in producing the change of opinion had been Mr. COBDEN and Mr. BRIGHT. Now it may confidently be said that disinterested conversion from one set of opinions to another had not been heard of for centuries in Europe as a force in politics, and it was natural that the men who wielded the new instrument should be regarded with universal curiosity. Soon, however, it appeared that, next to Free-trade, Mr. COBDEN and Mr. BRIGHT believed in peace—almost in non-resistance; and the advocacy of this policy by men who had shown themselves to be possessed of new and genuine power caused as great and as general astonishment as the surrender of Sir ROBERT PEEL to their economical opinions.

Neither of the doctrines with which Mr. COBDEN and Mr. BRIGHT were identified has ever been well understood on the Continent of Europe; and the surprise which they occasioned when they were first promulgated has left plain traces behind it. Free-trade has made some way in a few Continental countries; but almost never in the shape in which it triumphed in Great Britain. There is no European statesman who can be said to have accepted it as the logical result from a body of incontrovertible truths. Here and there certain industries recognize it as for their interest, and are anxious to introduce or extend it; but it is hardly ever advocated on theoretical grounds; and indeed the all but universal assumption throughout Europe is that Protectionism is the natural characteristic of a tariff, and that a special case must always be made out for the reduction of any particular duty of importation. And if the doctrine of Free-trade is misunderstood, still less is the doctrine of Peace comprehended. The date of its first promulgation at Manchester almost exactly marks the beginning of an era of gunpowder and glory. The principle that peace should be purchased at any price short of the most extreme thus remains a wonder in the eyes of all men but Englishmen; and it is only not ridiculed because, like Free-trade, it is believed to be specially associated with England. There has been much striking evidence in the conduct of English Governments, of all sorts of political complexion, that this country is as far as possible from having adopted it; yet the belief that she is influenced by it, or is going to be influenced by it, is always growing up from time to time in European Chanceries; and of course it is this impression that England cannot be depended upon not to do something some day quite as startling as the sudden abandonment of protection to all domestic industry, which causes the present Continental speculation as to the significance of Mr. BRIGHT's seat in the Cabinet.

It is doubtless the irony of fate which has made Mr. BRIGHT the symbol of long-suffering and non-resistance. We Englishmen who know him well have long since seen that, when his cheek is smitten, it is not the other cheek, but the doubled fist, which the reflex action of his nervous system presents to the assailant. We may even suspect that, now that he is in office, if any intolerable insult were offered to his country, his temperament would be too strong for his convictions, and no Minister in the Cabinet would perhaps be more eager in the demand for reparation than Mr. BRIGHT. But this is purely British knowledge. The foreigner can only judge Mr. BRIGHT by his public declarations, and these are exactly of a kind to produce the impression that he has changed in nothing since, in the heyday of his oratorical vigour, he first preached peace at Manchester. For, as we all know, Mr. BRIGHT always nowadays makes the same speech. The prosperity of the United States, and the excellence of their institutions; the virtues of the Liberal party, and the innumerable benefits which it has conferred on the British people; the inborn wickedness, stupidity, and obstructiveness of the Tories; the inestimable value of the penny press, and the burdensomeness of India—all these topics recur again and again, with an iteration which is only not wearisome because the language in which they are clothed has not lost much of its ancient spirit and point. It is only a close observer who perceives that, in the eulogy on all things American, there is now an absence of reference to that peculiar peacefulness by which the American people was once supposed to be distinguished, and who recognizes in the combativeness which animates every sentence the temper of mind which, if the circumstances surrounding the speaker were altered, might even lead him, as a Minister, to prefer war, upon adequate provocation, to peace.

It is not, therefore, surprising that, seen in the dimness of distance, Mr. BRIGHT should appear to have neither learned nor forgotten anything since his Manchester days, and that the Cabinet which includes him among its members should appear to nine-tenths of Europe to have hoisted the flag of peace at any price. It would be idle to deny that this impression about the new Government is far more important than any opinion which may prevail on the Continent as to the views of the British Foreign Office on the execution of the Treaty of Berlin or the development of nationalities in the Balkan peninsula. The doctrine proclaimed by Mr. COBDEN and Mr. BRIGHT seemed singular and paradoxical when it was first given to the world, and yet forty years ago there was much to explain it. There had been peace since 1815, and men, as is their habit, had begun to think that what had lasted so long would last for ever. The one Power which had remained armed to the teeth was Russia, and it has been generally believed that the Russian EMPEROR had sufficient faith in the new principles to be persuaded that they had added to his strength by removing one formidable opponent from his path. But nowadays a Ministry of non-resistance is a far greater paradox than it would have been in 1840 or 1850. Such a Ministry issues Circulars to its representatives abroad, entertains enlightened opinions on all sorts of questions, and gives the most admirable advice. But when a great crisis comes, it is obliged, if it is true to its principles, to stand by while facts accomplish themselves. This reverses the process of which we have had so much experience during thirty or forty years. Wherever great results have been achieved, action has come first, and lecturing or theorizing afterwards. The members of the French National Assembly were seized during the night in their beds towards the end of 1851; and then came an Empire which was afterwards discovered to be Peace and a good many things beside. The most considerable event of our time is the establishment of the German Empire in the centre of Europe. But it began in an elaborately contrived rupture, sought to be justified by the most technical and trivial pretexts, and it was not till much later that the cause of national independence was declared in hundred of pæans to have had its greatest triumph, and that Prince BISMARCK was able to affirm that nothing would delight him more than general disarmament and settled European peace. A policy without a determination to enforce it, or with a determination not to enforce it, has become the most singular of anomalies in Europe, however wise it may be, and however forcibly it may be expounded. One of the chief difficulties of the new English Ministry will be to prove to the world that its speech, which is silver, will be found at some point or other to be plated over iron.

ALSACE-LORRAINE.

It is natural that the French should have their lost provinces constantly in their minds, and should seek to assure themselves that it is not only France, but Alsace and Lorraine also, that have suffered seriously through the enforced rupture of their ancient ties. Prudence forbids any Frenchman of eminence and competent knowledge to write freely on a subject which is felt to be politically dangerous; but an anonymous French writer has recently done all that ingenuity and industry can suggest to make out a case bad enough to seem exceedingly satisfactory against the German occupants of the territory that France has lost. The burden of his story is that these provinces are as little Germanized now as they were ten years ago; that there is not the slightest sympathy between the conquerors and the conquered; that pedantic and irritating changes have been made in every department of administration; and that the bewildered provincials are being pushed rapidly down the hill of material decay. There is much more than vague declamation in this criticism, for it is based on facts that deserve attentive consideration; but from the outset we feel that we are in the hands of a writer who does not even pretend to be impartial, and who makes no effort to understand how it can be that ideas which are repugnant to him seem natural to Germans. He detests all Germanization—not only the Germanization of Alsace-Lorraine, but the Germanization of Germany. According

to him the Germans are a perverse set of military archæologists, who, while they have taught themselves to fight, have also taught themselves to look on the middle ages as the ideal period of their history, who are constantly retrograding, and have no proper place in the life of the nineteenth century. That everything German is sure to have its formal and pedantic side is undeniable; but then it may be safely said that no one except a Frenchman could have brought himself to regard the revival of national feeling in Germany as a mere archæological craze. This French critic writes as if he had never heard of the wars of the first NAPOLEON, of the tyranny and insults to which Germans were exposed during the years of the French domination, and of the crushing repression of all national aspirations under the monotonous absolutism of NAPOLEON and his Marshals. When the yoke of NAPOLEON was thrown off the Germans longed, not only to be left to themselves, but to feel themselves a nation. They went back in thought to the time when Germany seemed to have been really and exclusively German; when there was a unity of institutions and something like a unity of aims, and when Germany had not yet been broken up into the petty States which afterwards became the tools or the prey of the foreigner. The French critic dwells on the easy, happy life which the inhabitants of these petty States often led. To be the obscure subjects of obscure princes is the precise lot which, with the calm superiority of a Frenchman, he considers the Germans were created to enjoy. He mourns over the Alsatians because they were not permitted, in becoming Germans, to enjoy the only kind of happiness of which Germans are capable. If they had been provided with a Serene Highness, and been left to vegetate under his benign influence, they might have been tolerably prosperous and tolerably contented. It is impossible that any one outside France should acquiesce in this mode of interpreting the wishes and destiny of Germany. In becoming a great and united nation the Germans no doubt had to give up something. They lost the humble placidity which so often compensates the obscure for being forgotten by the world. What they gained in exchange was a reasonable security that there should be for them no recurrence of the days of NAPOLEON and his Marshals. If they had to take new provinces into the Fatherland, they necessarily made them a part, not of the Germany that was trampled on by NAPOLEON, but of the Germany that trod underfoot his successor at Sedan.

The French critic thinks it something dreadful that Prince BISMARCK should on one occasion have frankly confessed in the German Parliament that he could not be always troubling himself about the likes and dislikes of the inhabitants of the conquered provinces, that Alsace-Lorraine was primarily meant to be the rampart of Germany, and that he would take care that it was made as good a rampart as possible. This seems nothing more than the statement of an elementary fact. The Germans hoped that the large portion of the population which speaks the German language would not be unwilling, or even perhaps would be glad, to find itself once more incorporated in the country to which it formerly belonged; but they never pretended to draw the line of their new frontier for any but purely military purposes. There are half a million of Lorrainers who have nothing whatever to do with Germany, but who were arbitrarily turned into Germans because German soldiers considered their territory indispensable for strategic purposes. Soldiers built forts and devised military railways where, for their own objects, they thought it best that forts should stand and railways run. Of one of these military railways, that from Strasburg to Lauterburg, the French writer gives a picturesque description, piling up his epithets and accumulating his details in order to give the impression that this line must be a terrible nuisance to the unfortunate inhabitants of the district. The construction of the line is, he tells us, that of a continuous embankment for fifty kilometers, so as to furnish a cover for sharpshooters. Every little arch has its chamber ready for a mine; every little guardhouse has its loopholes and its barbicans; at every five kilometers there is a station, and the station building is surrounded by a tower in which there is a clock, the face of which masks the embrasure of a cannon. The outbuildings and surroundings of the stations are on far too grand a scale for peaceful purposes, and all around stretch beautiful kitchen and flower gardens, where deceptive lettuces and nasturtiums grow, but which the keen eye of a French traveller detects to be meant each as a little Cyprus and a possible place of arms. It is sad, too, to think that the natives of the district got nothing out of the construction of these barbicans and clock-towers or the planting of the lettuces and nasturtiums. The Government paid for the line out of the milliards, and was in such a hurry to spend its money and get its railway that it brought in a host of strange workmen to carry out its designs without the loss of a moment. The railway has been finished, the workmen are unemployed, and these intruders now hang in idleness and poverty about the towns and villages of Alsace. This is impressive; but it only comes to the simple fact that the Germans made a military railway, and made it as it best suited them. There is nothing to constitute a grievance for the Alsatians, if it is once understood that it is their special mission to provide Germany with a scientific frontier. When this is once accepted, it is difficult to see why the Alsatians should complain of the mode in which they have been treated with regard to public works. We do not know that they do complain, but their French friend feels sure that they ought to complain. The military railways were not made with their money, but with the milliards extorted from France. When it came to spending their money on public works, they were allowed to spend it or not as they pleased. They even resisted successfully a strong pressure put upon them by the Prussian Government to execute a work in which that Government was much interested. The coal-fields of Saarbruck belong to Prussia, and the outlet towards France is through the canal of the Saar in Lorraine. By means of a new system of canalization made since the war, the French on their side of the frontier can bring Belgian coal into the district. The Prussians wished to compete, but found that in order to do so effectually the bed of the Saar canal must be deepened. They offered the province a subvention to induce it to carry out the work; but it refused, and, as Lorraine belongs to Germany and not to Prussia, the Prussian Government was powerless. This seems a curious instance to choose of German harshness and tyranny. The injured provincial as he gazes at those treacherous nasturtiums may at least comfort himself with the thought that he can prevent Prussians from sending their coals to market at a remunerative price.

There are, however, some respects in which the situation of the inhabitants of the annexed provinces has changed for the worse. In the first place, they have to pay more in taxes than they used to do. This is what would have happened to them even if they had remained a part of France, and both in France and in Germany taxation has largely increased since the war. But the provincials find German administration not only more irritating, but more expensive, than French, and this is the part of their new burdens to which they most object. Secondly, the German commercial system and German commercial habits have nothing very attractive for those who have been recently brought within their influence. Protection favours German goods, and the provincials complain, not only that German goods are forced upon them, but that the goods forced upon them are very bad of their kind. Cheap and nasty was the verdict passed on German goods at Philadelphia, and it is the verdict passed on them by the provincials who are now excluded from access to the superior workmanship of France. Then the humble German trader is not a fascinating being. The Alsatians complain that he is nothing but a Jew who comes among them merely to make the best of petty bargains, with some malicious scheme always in his wily head, and having no real connexion or sympathy with those whom the fortune of war has permitted him to plunder. Lastly—and this is the point on which the French writer dwells with the greatest urgency—the whole legal system and the whole system of the administration of justice have been recast in Alsace and Lorraine. The provincials have been deprived of all the advantages which they believed themselves to derive from the Code NAPOLEON and from the symmetrical system of French legal administration, and instead they have got the new German Code and Germans to work it. The writer is, if possible, more contemptuous of German law than of anything else that is German. It is in his eyes a mere childish return to feudal customs and mediæval institutions. The worst point on which he can fasten is that there have been established everywhere very subordinate judges who go about their little districts and are helped by assessors. The notion of a judge trotting about a district seems ludicrous to a Frenchman, and the employment of assessors is open to the reproach

that assessors were employed a thousand years ago, and are not employed under modern French law. Then far too much importance is attached to oral testimony. There may have been little other testimony on which to rely when the art of writing was known to few but the clergy; but the superiority of written over oral proof has been recognized in French law for three centuries, and it seems strange that German jurists should be blind to the danger of allowing men by free swearing in Court to go back on that which they have committed to paper. An inevitable consequence of a lax mode of regarding writings is the increase of speculative litigation. To check litigation judicial fees have been increased, and in one way or another litigation has become in Alsace-Lorraine so much more frequent or so much more expensive that the judicial fees now figure in the provincial budget for a sum twenty times as large as that which they produced under the French system, while the communes have had to provide seventy-six new houses of detention to receive those who may fall under the displeasure of the wandering Judge and his assessors. No doubt all these things produce a certain amount of friction. New laws, more suits, judges of a new pattern, goods cheap and bad, Jew-like hucksters, and more taxes to pay, do not make life pleasanter, or cause those who bring them in their train to be beloved. A Frenchman who would be very sorry, or who would perhaps refuse, to see anything different, may still be right in seeing in Alsace-Lorraine a failure on the part of the Germans to win over their new brethren to a cheerful acquiescence in the fate that has befallen them. But at any rate the provincials cannot think that they are specially badly treated. Everything the Germans do to them they do to themselves, and it is not easy to see how Alsace-Lorraine could have been treated better if it was to be seized in order to form the rampart of Germany.

RUSSIA AND CHINA.

IT seems probable that the Chinese Government has determined on war with Russia. If the sentence on the unfortunate Envoy who signed the Treaty of Livadia is executed, the judicial murder may be considered as a ceremonial announcement of the rupture. The merits of the quarrel are but imperfectly understood, though it is admitted that the Russian Government promised several years ago to restore the province of Kuldja to China on certain conditions which seem to have been satisfied. By the treaty of which ratification has been withheld, certain districts, which are of course described by the Chinese as the most valuable parts of the province, were to be retained by Russia on the abandonment of the rest. It is impossible to judge whether the provision was equitable, or how far such an arrangement was comprehended in the powers given to the Ambassador. According to the European doctrine of public law, the Chinese Government had a strict right to decline ratification; but in dealing with Asiatics civilized Governments are not always in the habit of conforming to any definite international code. Although the Russian Government professes to have taken offence, its grievance must be effectually mitigated by its possession of the disputed territory, especially as the former promise of evacuation will be regarded as no longer binding. Although the Russian army in the eastern part of Central Asia may perhaps not be for the time strong in numbers, a few regiments would easily hold their own against any force which could attempt to drive them out of Kuldja. It may perhaps not be true that some of the Chinese troops in those regions are still armed with bows and arrows; but neither their weapons nor their discipline would enable them to contend with comparatively weak bodies of Russians on equal terms. The Mahometan population which may have survived the former war and the massacres by which it was attended will probably prefer the Russians to their implacable Chinese enemies. On the other hand it is probable that the Russian Government would not have undertaken to restore Kuldja if the possession of the province had been profitable or convenient.

The difficulty of divining the motives of the Chinese Government is aggravated by uncertainty as to the persons with whom the direction of the Imperial policy may rest. The grandmother and mother of the young EMPEROR, who ostensibly exercise his prerogatives, are more likely to be governed by Court favourites than by grave and responsible Ministers. The extent of authority possessed by the EMPEROR's kinsman, Prince KUNG, who is an experienced statesman, is imperfectly understood. The project of war with Russia appears to be too serious a policy to result from a palace intrigue; and yet it offers no intelligible hope of national advantage. Its promoters have already displayed commendable activity of preparation by settling the dispute with Japan. No other ally could in case of war have been so useful to an enemy of China; and it would be a triumph of diplomacy to convince the Japanese that they also are threatened by their powerful Western neighbour. The impending rupture will happily not involve European complications. The Ambassadors at Pekin, including the representative of England, have used their utmost exertions both to save the life of the late Envoy to St. Petersburg and to dissuade the Chinese Government from its warlike policy. One or two Russian papers alleged that the Kuldja dispute was prompted or embittered by England with the object of creating a diversion in Central Asia; but, even if any English purpose could be served by the extension of Russian territory which may probably be a consequence of the war, the interest of England in the commerce of China largely preponderates over any benefit which could be derived from a war in the heart of the continent. It is not impossible that irritation against Russia might extend to all foreigners; and a maritime war is always injurious to the trade of neutrals. The great bulk of foreign commerce with China is in English hands, and heavy loss might result from a blockade of any of the treaty ports. Probably Shanghai might be exempted from such an inconvenience. It has often been remarked that, in consequence of common relations and of exposure to similar dangers, the European and American community has there constituted itself into a sort of little republic. When powerful Mandarins from time to time encourage the lower classes in their hostility to foreigners, the merchants at Shanghai make joint preparations for defence.

The Russians have lately strengthened their fleet in the Pacific; and although the Chinese Government possesses some powerful war steamers, it will scarcely be able to contest the maritime supremacy of Russia. Indeed there seems to be no vulnerable point at which, either on sea or land, the Chinese can reasonably hope to inflict any damage on the enemy. To uncivilized enemies they are formidable by reason of their inexhaustible numbers and their dogged perseverance. The Mahometan States which were established as the result of a successful insurrection seemed likely to be permanent; but when they were weakened by accidental circumstances, the Chinese gradually pressed on, and filled up the gaps which were produced by a war of extermination. A civilized opponent such as Russia may find Chinese hostility troublesome and expensive; but it has nothing to fear from their military or naval force until China shall have adopted European organization. If the Russians intend to keep Kuldja, they cannot be driven out, although they may possibly have a long struggle to maintain their dominion. It is fortunate that the Indian Empire is for the most part separated from the Chinese frontier by wholly or partially independent States; and there has not yet been a territorial dispute between the two Empires. The treaty rights, indeed, which were acquired twenty years ago rest ultimately on force; but the coast of China is accessible to ships of war; and Pekin might, if necessary, be once more occupied. The two Chinese wars which shocked the philanthropists of the last generation have produced lasting peace and commercial intercourse, if not good will on the part of the defeated combatant. The English and French were at that time compelled to assume the offensive. The Russians, in the event of a rupture, may, if they think fit, avoid collision with the Chinese, except in the improbable contingency of an attempt to obtain forcible possession of Kuldja. They may perhaps extend their dominion over the adjacent provinces of China, but they are probably not anxious to burden themselves with an unprofitable addition of territory.

Notwithstanding the apparent laxity of administration which prevails throughout the Empire, the Chinese Government has for some years past encountered no formidable resistance in any part of its dominions. Since the victories of Colonel GORDON, the Taepings seem to have become extinct, and minor attempts at rebellion have been

easily crushed. The recent collapse of an insurrection headed by a bold adventurer has been followed by an attempt to resume an obsolete sovereignty over the Portuguese possession of Macao. The circumstances are not accurately known, but it appears that the Chinese authorities have taken proceedings which imply a refusal to acknowledge the Portuguese title. Whether a legal form or fiction will be converted into a practical claim probably depends on the power of the foreign settlers to maintain rights which are now for the first time questioned. It is highly probable that in Chinese estimation Hong Kong, though it is possessed in full sovereignty by England, may be either a feudal dependency or perhaps a province of the Empire. The Chinese know how to make practical use of their partly real and partly affected ignorance of the condition and rights of foreign nations. On ceremonial occasions the representatives of civilized States have found it almost impossible to assert their equality by methods at the same time satisfactory to themselves and intelligible to prejudiced native spectators. The contrivances by which Chinese courtiers seek to humiliate unconscious strangers have a childish and ludicrous aspect; but, as far as they sustain the natural conviction of superiority, they may sometimes have political value. It is possible that the injustice inflicted on the unfortunate Ambassador, and the menacing attitude which has been assumed towards Russia, may be intended rather to impress the imagination of Chinese subjects than to prepare the way for an impolitic war; yet it is surprising that the Government should not have seized the opportunity of recovering that portion of the province of Kuldja which Russia was willing to cede. It would always have been possible to repudiate or violate the treaty after profiting by its provisions, if circumstances had rendered the recovery of the territory retained by Russia safe or easy. Although China is not yet formidable to great and civilized Powers, the resources which it possesses in the inexhaustible numbers of the population are in their kind wholly unequalled. The national indifference to human life would enable an ambitious Chinese ruler to make enormous sacrifices for the increase of his power, and the tried stability of the Empire renders possible a steady and continuous policy. The bigotry which restrains the Chinese from the use of material improvements of foreign origin suggests a large reserve of wealth and power. The prohibition of railways, because they must in the first instance be constructed and worked by Europeans, will not be perpetual. The Chinese Government has, with a certain inconsistency, imported from England vessels of war of the newest construction; and, although the armament of the troops is still defective, it is believed to have been greatly improved since the last war. If there should be a prolonged contest with Russia, though the result will not be doubtful, it is probable that the Chinese may learn much from the enemy.

PRINCE BISMARCK.

PRINCE BISMARCK has kept away from the German Parliament long enough to make his re-appearance interesting, even if he had not turned the occasion to such really remarkable account as he did last Saturday. As has happened with some of the PRINCE'S most important speeches, what he said went very far beyond the question actually before the House. The occasion of his speech was a motion of Dr. DELBRÜCK'S providing that the ratification of the revised agreement between Germany and Austria relative to the navigation of the Elbe should not prejudice the right of Parliament to determine whether the Customs frontier on the Elbe shall continue, as now, above Hamburg, or be transferred, as the German Government are understood to wish, to a point considerably below that city. This question is indirectly associated with the proposal to incorporate a part of Hamburg into the Customs territory of the Empire. If the change is made, the examination by the German Custom House officers of vessels coming up the Elbe will take place before they reach Hamburg, instead of after they have passed it. It is easy to see what large powers of annoyance this would place in the hands of the Government, and how easily it might be used either to force Hamburg to surrender her rights as a free port or greatly to hamper her in the use of them. The original agreement between Germany and Austria, which dates from the year 1821, specifies the point at which the Customs station shall be fixed; and Dr. DELBRÜCK contends that, in any alteration of the agreement, the place of the Customs station should equally be fixed by Parliament.

It was in answer to this contention that Prince BISMARCK spoke. He did not affect to regard the particular issue as of much importance. The reason he assigned for his reappearance was his desire once more to bear his testimony against the parties which seek to obstruct the development of German unity. It might, however, be the last time in which he should bear this testimony as CHANCELLOR, though he hoped to bear it to the end as a private member. It was especially necessary for him to expose the wicked designs of these parties, because their authors have succeeded in deceiving the very elect. Dr. DELBRÜCK had been his most active and valued fellow-worker in the establishment of the Empire, yet he is now making common cause with the Clericals. The Clericals are the worst enemies the Government had to contend with. They are very strong, and very well disciplined, and the consequence was that they are usually able to furnish half the numbers in an average division. The Samoa Bill was thrown out the other day by a majority half of which were Clericals, and as they are commonly ready to reinforce any party which desires to see the Government defeated, there is never any security that this incident would not repeat itself. Poles, Progressists, Free Traders, all become important in proportion as they make common cause with the Centre. It is to be noted that Prince BISMARCK himself has been guilty of the very crime which he attributes to his adversaries. Last year he went away from Parliament under the conviction that the Centre meant to effect some compromise with the Government. They showed, that is to say, a decided disposition to vote as the Government wished them to vote, and the PRINCE was so pleased with their behaviour that he had serious thoughts of making peace with the POPE. This Session, however, things have gone from bad to worse. The Centre has voted against the Government, and every fraction of the Opposition in turn has supported the Centre in doing so. All this makes for the advantage of Particularism. The National Liberals, who have of late been the greatest sinners in the way of keeping bad company, very much mistake their real interests when they give support to the Centre. They only encourage the Particularist Governments, who want no encouragement. Nor are these Governments themselves much better advised. They may vote against one another in the Federal Council as much as they like, but they may find it dangerous to vote against Prussia. As to Prince BISMARCK himself, it is a matter of very small moment whether the Liberal fractions continue to make common cause with the Centre, or refuse it all support for the future. In the latter case, he is confident of his ability to carry out his policy to the end; in the former case he will be able to wash his hands of the whole concern and go back into private life. Thus he is sure either of victory or rest, and both will be equally agreeable to him.

For the first time Prince BISMARCK seems to have threatened resignation without conveying any sense of terror to those who listened to him. It may be that he has at last convinced the Liberal party in the German Parliament that he does not mean what he says, and that if they continue to vote according to their convictions, he will find some excuse for not inflicting the penalty so often denounced. Great Ministers have been taken at their word before now, and found in the end that a resignation which no one really desired had to be persevered with out of pure shame. At all events, the particular motion which had called forth Prince BISMARCK'S speech was virtually carried against the Government. The new Elbe Navigation Act was referred back to the Select Committee, which has already reported on it, because it contained the clause objected to by Dr. DELBRÜCK. Probably it is not only the frequency of the CHANCELLOR'S threats of resignation that has brought about this result. This undisguised indifference to the issues professedly involved in the legislation against the Catholic Church can have pleased nobody. For nine years Prussia has been agitated by the conflict between the CHANCELLOR and the Vatican. The May Laws have been a constant source of confusion and disturbance. They have not been accepted by the clergy, and in so far as they have been carried out by the secular authorities, they have simply made a united

community a divided one. These are serious consequences to be laid at the door of a particular policy; but it is conceivable that the gain arising from this policy has been so unmistakable that even such drawbacks as these may be put up with. In this case, however, it is for Prince BISMARCK to indicate what these gains have been. It might have been supposed, for example, that he would not have been ready last year to suspend the May Laws unless he had been of opinion that they had answered their purpose. Prince BISMARCK attempts to show nothing of the sort. His object in passing these laws, and his object in holding out hopes of their repeal, has been exclusively Parliamentary. He has been punishing Catholic priests and Catholic bishops because Catholic laymen would not vote as he wishes them. He admits that this is what he has been doing for the last year. It is the action of the Centre in the German and Prussian Parliaments that has made him change his mind about the May Laws. Prince BISMARCK has so accustomed Europe to avowals of this sort, that their full cynicism may scarcely be appreciated. It is very much as though M. DE FREYCINET were to declare that he had published the decrees against the religious orders, not because the religious orders did any particular harm, but because the clerical members of the Chamber of Deputies had voted against the Government on the renewal of the commercial treaty with England. If the May Laws were designed not to ward off a specific danger from the country, but to coerce Catholics into supporting Prince BISMARCK's general policy, there is no section of German or Prussian opinion that can really defend them. Those who dislike this kind of legislation will be able to point to Prince BISMARCK's speech in proof of their contention that it was not required. Those who approve of this kind of legislation will naturally resent an assurance coming from so authoritative a source that it was resorted to merely as a piece of political strategy, and without the slightest reference to any danger to be apprehended from the Catholics. Prince BISMARCK has so often frightened his adversaries into supporting him against their will, that he may succeed in doing so again. But he has never strained his influence so severely as he has done in this instance.

THE DEVONSHIRE CLUB DINNER.

SOME fault has been found with the members of the Devonshire Club for dining together last Wednesday—a piece of fault-finding which we are inclined to think very unreasonable. It is an established maxim in English life that there is no event in existence which does not justify one or both of two proceedings on the strength of it—a presentation at Court and a complimentary dinner. Moreover the guests on this particular occasion, having stood for constituencies in which the Devonshire Club is situated, and of which a large number of its members may be supposed to be electors, had a perfectly sufficient claim to be feasted. The entertainment might perhaps have been spared the presence of the very talkative and very self-satisfied young gentleman whom Middlesex rejected, and whom Leeds was not too proud to pick up. Mr. HERBERT GLADSTONE's reference to the "purer political air of the North" was quite in the paternal style, both in its probably unconscious identification of purity and self, and in the remarkable felicity of the conjunction of the ideas of Leeds and pure air of any kind. But Mr. H. GLADSTONE's presence since his adoption, *faute de mieux*, by the town of cloth, was in some sense a superfluity at the Devonshire Club dinner, which was designed to celebrate not so much victory as defeat. Even had it been otherwise, Lord HARTINGTON's very graceful and temperate opening speech would have disarmed the most exasperated Tory—supposing that, after certain recent events, exasperation could linger in any Tory breast. There is something curiously odd in the contrast which the actual leader of the present Ministry and the somewhile leader of the late Opposition present. With one signal and unfortunate exception, Lord HARTINGTON has never eaten his words, simply because he has always measured them. He rarely speaks —he rarely spoke even in the heat of the late contest —without bringing his hearers back into that serener atmosphere of political conflict where the weapons are "arms of courtesy," and where the battle is conducted on the principles which befit a battle in which the question at stake is who shall do most good to the country in his own way. There must indeed have been considerable mental qualification in the hope which Lord HARTINGTON expressed that his party had "succeeded in avoiding personality." But for his own part he might have made the statement in stronger terms than that of hope. It is Lord HARTINGTON's misfortune, not his fault, that he has to repair the blunders and excuse the indecencies of colleagues who are older than himself, but certainly not wiser.

In the replies of the guests the same spirit of moderation was not uniformly exhibited. Sir ARTHUR HOBHOUSE has before now exhibited proficiency in the art of putting his foot in it, and he certainly repeated the manœuvre on Wednesday night. It appears, indeed, that Sir ARTHUR "does not desire a seat in the House of Commons." The grapes in May are still sour, no doubt. But the original fox did not, as far as we remember, make his statement to an assembly gathered together to congratulate him on the efforts he had made to show that they were sweet. Sir ARTHUR's references to the past were, however, less remarkable and much less unfortunate than his hopes as to the future. He hopes, it seems, that at the next general election the strongest argument in favour of the Liberal candidates for Westminster will be a comparison between the present Government and the last. He hopes to be able to say that "since Lord BEACONSFIELD was "driven from office, no Minister has tarnished his honour "by saying the thing that was not, and that when "our Ministers make an assertion, that assertion represents a fact." Alas for Sir ARTHUR HOBHOUSE! His speech was doubtless composed before the publication of Mr. GLADSTONE's letter to Count KAROLYI and of Mr. STANHOPE's reply to Mr. FAWCETT. Mr. FAWCETT, at any rate, is, we should have said, a very conspicuous instance of a Minister, if not a Cabinet Minister, making an assertion which represented the very reverse of a fact. Mr. JOHN MORLEY, as was to be expected, steered clear of such rocks. He need not perhaps have done vicarious penance for the "journalist and man of letters" over whom Lord HARTINGTON had indulged in the least little crow—the most polite and gentlemanlike of crows. The INDIAN SECRETARY had perhaps fair game of not a few of our contemporaries in his reference to the dispositions evinced towards the new Government by some pretty loud supporters of the old. The jades which are galled by this may wince, and those whose withers are unwrung need not affect any inordinate sympathy with them. But when Mr. MORLEY declares that the London journalist has latterly been the "wrongest of men," and attributes his wrongness to a belated admiration of Lord BEACONSFIELD, he is scarcely on such safe ground. His attribution of causes is certainly erroneous, and events seem in the most obstinate and ungracious way in the world to be showing that the men of letters and journalists were curiously right in their wrongness. They said, for instance, that Mr. GLADSTONE would as Prime Minister make himself and the country ridiculous, and he has done it almost before his chairs and tables have had time to get into Downing Street. They said that the incoming Ministry would find it impossible to reverse the foreign policy of the late Government, and this, too, has already been proved true. On the part of the "wrongest of men" these must be admitted to be singular and unaccountable glimmerings of rightness, shown to be such in a still more singularly and unaccountably short space of time.

Politically speaking, the two speeches which Lord HARTINGTON made, if they do not contain much positive information, present a sufficiently curious study, and throw not a little light on the present somewhat anomalous state of the Government. As to what the Ministry was going to do, the speaker naturally could or would give but little information on the subject, only begging for no indulgence in great expectations. It seems to have burst upon the late Opposition quite suddenly that the government of the country in such times as the present is not such an easy thing after all, and requires considerate handling. As to general lines of conduct, Lord HARTINGTON could only make the familiar reference to "those principles which we are endeavouring to "support and that policy which we wished to condemn." But to these mysterious principles the old Herodotean phrase, "which it is not lawful to mention," might conveniently have been added; and, as to the condemned policy, it must have struck even Lord HARTINGTON's hearers as odd

that it should already have been adopted. But the real subject for remark was the singular position which the speaker and his hearers assumed towards each other. Lord HARTINGTON spoke as the virtual leader of the Liberal party; expressed, as such, his acquiescence in present arrangements; was treated as such by the guests. The general conclusion resulting from the whole affair was that Mr. GLADSTONE is Premier by the grace of Lord HARTINGTON. And this conclusion results, not from any assumption in words on the part of the younger leader, nor from any suggestion of disagreement, but simply from an indefinable total impression. That such an impression is in accordance with what Mr. CARLYLE used to call the laws of the Universe, such events as the KAROLYI letter seem to be rapidly proving. The situation is altogether a peculiar one, and it remains to be seen how far it will prove lasting or possible. As far as Lord HARTINGTON is concerned it must necessarily be to his advantage. He has plenty of time before him, he can afford to wait, and every folly and false step of his nominal superior must redound to his credit. Probably, too, the triple wall of self-esteem which hedges in Mr. GLADSTONE will prevent him from realizing the relation in which he stands to the INDIAN SECRETARY. If he did realize it, the effect might be rather alarming; for Mr. GLADSTONE, as was said of DRYDEN, "is not of a temper to design to be a foil to "any one." But while the nominal unity of the Ministry may thus be maintained notwithstanding a position almost as logically false as, as it was said beforehand, would be that of a Ministry with Lord HARTINGTON at its head and Mr. GLADSTONE as a subordinate, the possibility of permanently maintaining the unity of the party seems more doubtful. In the first flush of victory Radicals like Mr. COHEN, and even Radicals of a more advanced type than the member for Southwark, may be content to eulogize Lord HARTINGTON. But when the situation which is just emerging becomes further developed, when the divergence of Radical and Whig becomes once more marked, how will the Extreme Left bear the increase of Lord HARTINGTON and the decrease of Mr. GLADSTONE, and what will be the result of their apparently inevitable discontent? We can only say that then will come the time for Lord HARTINGTON to clear himself of the only stain on his political scutcheon—the too memorable surrender to Mr. CHAMBERLAIN on the Army Discipline Bill. It is possible that that surrender was dictated by a feeling that in Opposition and in the day of battle "it would not do to discourage "friends," a feeling politic perhaps, if of doubtful morality. There will be no such excuse in the case now supposed; and it will be at that day, which must sooner or later arrive in the ordinary course of things, that Lord HARTINGTON will have to show whether his moderation comes from the consciousness of strength or from the consciousness of weakness.

SUNDAY LABOUR IN FRANCE.

THE French Senate has lately had under consideration a Bill to repeal the law which forbids labour on Sundays and Feast-days. Englishmen may be surprised to hear that such a law is in existence. A "French Sunday" has long been a synonym in this country for a day on which the shops are open and the ordinary occupations of life go on as they do during the week. There has of late years been a considerable movement among Catholics in the direction of a stricter observance of Sunday, but it has not been extensive enough to affect the general aspect of business life. Ever since 1814, however, a law forbidding Sunday labour has had a place in the Statute-book, and the Sabbath-breaking customs which have so shocked English travellers of the gentler yet stricter sex have grown up in distinct violation of it. It may be thought that, as the law has never been obeyed, it was needless to provoke religious strife by a proposal to repeal it, and before the resuscitation of the laws against the religious orders this argument might perhaps have prevailed. But it is not an argument to which a Government which has been hunting up disused weapons in the legal armoury can resort without danger. The law against Sunday labour is at all events more recent than the laws on which the decrees against the Jesuits are founded, and it is certainly not more obsolete than the latter were till lately supposed to be. Supposing that an attempt to put the law of 1814 in force had suddenly been made, the Government would have found themselves in a difficulty. They could hardly have allowed the law to be put in action without remonstrance or contention, and yet, if they had resisted the application of it, they must have done so on the ground that laws which have been allowed for a long course of years to go unexecuted have thereby become obsolete. The spectacle of the Government lawyers reduced to employ this argument would have been more pleasing to good Catholics than edifying to good Republicans.

That the law has never been popular in France is not wonderful. It dates from a bad time. The religious reaction of 1814 was one of the least respectable of its class. It was vindictive rather than reforming, and more anxious to annoy the sinner than to reclaim him. The repose of the workman held but a small place in the thoughts of the authors of the law. They were more interested in securing the observance of an occasional Feast-day which was only recognized by Catholics, than in giving legislative force to the weekly holiday. What is stranger still, however, is that the French workman has never learnt to regard the observance of Sunday in the light in which the English workman regards it. What this light is is very well shown by the reception which the working classes have mostly given to the movement in favour of opening museums and picture galleries on Sundays. The English artisan is not specially devoted to church-going, and he is probably quite indifferent to the alleged antagonism between the opening of those places and the religious observance of Sunday. The change would enlarge his opportunities of amusing himself during his weekly holiday; and if he chose to put the necessary pressure on the Government, he could obtain it without difficulty. Yet he does not put this pressure, although he is diligently called upon to do so by a Society which has been founded for the special purpose of opening his eyes on the question. The reason of this apathy is easily told. He has a very keen fear that, if there is more amusement to be had on Sundays, there will be more work to be done on Sundays. He does not believe, with one of the speakers in the late debate in the French Senate, that there is no need to protect the workman against his master, and that no matter what the law says, the workman will always be sure of the weekly holiday for the simple reason that he will choose to have it. The theory of the English workman evidently is that the security of the weekly holiday would be gone if there were no legal difference between Sundays and other days. He is so convinced of this that he does not wish to see that difference done away with, even in a particular in which it operates to his disadvantage. He believes, rightly or wrongly, that, in proportion as Sunday labour is recognized by law—he does not object to a good deal of it so long as it is not so recognized—the practical exaction of Sunday labour will be brought nearer. A habit of stipulating for work to be done on Sundays, and of including Sunday in the week's wages, and deducting a seventh part in the case of workmen who worked only six days, would, he thinks, grow up by degrees. Weighing one thing against another, therefore, he is content to see a few public galleries closed against him on the one day when he can go to them. He would rather, that is, have them closed than opened under conditions which, as he believes, might leave him no more opportunity of visiting them than he has now.

Why is it that there is no parallel to this feeling in the mind of the French workman? His position with regard to his employer is in no way superior to that of the English workman. He is no better able to resist a demand for more work than the English workman. Indeed it may fairly be said that in this respect his position is very much worse than that of the English workman. The hours of labour in France are very much longer than they are in England; and, whatever may be true of peasants working on their own ground or shopkeepers working in their own business, there is no reason to suppose that Frenchmen working for other people are any more disposed than Englishmen to work longer hours than they are obliged. The natural conclusion from this would be that the French workman, finding himself not so able as the English workman to hold his own against his master, would be proportionately more anxious not to part with a single element of protection which the law happens to give him. If this was the feeling, however, it would certainly show itself in the action of the Legislature. A Bill to repeal the prohibition of Sunday labour, instead of being supported by

a Radical Government, and commanding a majority even in the less Radical of the two Chambers, would have been stoutly and successfully resisted. It is the working-men who are most immediately interested in the maintenance or abolition of the law, and under universal suffrage there can scarcely be a doubt that a vote in favour of its abolition means that the working-men are glad to see it go. Why should French working-men look at the question in such a different light from that in which English working-men look at it? They are not less fond of holiday-making; they are supposed to know very much better how to make the most of a holiday. In the natural course of things, therefore, they should be even more anxious not to see the principle of a weekly holiday broken down, the more so as they cannot complain that in practice the law has ever prevented them from working on Sundays if they wanted to do so.

The explanation is to be found in that passionate hatred of Catholicism which supplies the key to so much in contemporary French politics. The French workman will risk the loss of his weekly holiday, just as he will risk the loss of the right of public meeting, or the right of association, or the right of educating his children to his mind, or of anything else that he values, provided that by risking it he can inflict a similar loss upon Catholics. He does not want to make holiday on Sunday; he prefers to make it on Monday. In England the workman's love of the Monday holiday is intelligible. It is another holiday in the week, a holiday tacked on to the Sunday, not a holiday substituted for the Sunday; and there is much more to be done on it in the way of amusement. In France the Monday is to a great extent substituted for the Sunday, not tacked on to it; and there is no reason in the nature of things why the workman should prefer the Monday. In fact, however, there is the very best reason possible. Catholics like to make a holiday on Sunday, and that is enough to send the majority of the artisans to work on that day, and to fill them with the hope that Catholic workmen may somehow suffer from their determination to treat this particular day as something distinct from the rest of the week. It is nothing to them that the interests of Catholics happen to be identical with their own, inasmuch as both desire a holiday, and only differ from one another as to the manner in which it is to be spent. The agreement goes for nothing, the difference goes for everything. The abolition of the law forbidding Sunday labour will get rid of one more link between religion and the State, and that is an object to bring about which a French Radical would gladly work an additional day a week. Even self-interest is silenced in the presence of theological passion.

SOCIAL AND LITERARY DANDYISM.

DANDIES, like saints, are never much beloved by their fellow-creatures. Like saints, they have an ideal perfection of manner and dress, and ideals are felt to be impertinent. To be a dandy is to outrage the vanity of every one who has not the energy to be wakefully attentive to details of deportment and costume. The great dandies of old days, Brummell, Lauzun, and the rest, were everywhere welcomed because they made themselves disagreeable to so many people. There is a kind of popularity which is acquired by an attitude provokingly unpopular. Men and women are attracted by the courage which despises and disregards their feelings. People whose minute perfections and sense of their own merit make them detested, become notorious, and consequently are sought after. A sage might say to aspiring boyhood, "Young man, be a puppy." In this respect, as in others more important, the prizes of the world are to the impudent. Society truckles to people who can consistently display their conscious superiority. The very magnitude of their insolence and the calmness of their fatuity excite curiosity and welcome analysis. People are anxious to judge for themselves as to whether a conspicuously conceited fellow is in earnest and a supreme fool, or whether he is quietly playing a part. Thus the eccentricity of imperturbable vanity, a vanity which declares itself in peculiarity of dress and manners, is rather a good introduction to society. A famous living statesman was remarkable for his canes and waistcoats even before he was admired or feared for his wit or eloquence. Dandyism was to him only a stepping-stone, as it usually is to young people of high ambition and real strength of character. They learn very early in life that to be remarked is the first thing necessary for success, and social is of course more readily attained than literary or political notoriety, and may lead on to these higher prizes. It would probably be a mistake to suppose that "the higher dandyism" is entirely a matter of calculation. The most distinguished dandies in the history of society have been men of great power and ambition disguised as fops. They have thus disguised themselves, not only because the distinction gained by impertinent perfection of dress was necessary to their projects, but because they could not do anything by halves, and because they were supremely vain. Vanity, a quality much decried, is really necessary for some sorts of success. Without vanity there could scarcely be any ambition. In the evolution of character vanity first declares itself in the love of finery which is remarkable in the child and the savage, and which clings to many generals, statesmen, and divines. The gigantic tailor's and jeweller's bills of a son do not usually make a parent's heart sing for joy; but these bills may, in rare cases, be more full of promise and encouragement than any number of medals and first-classes. It is difficult, however, to get parents and guardians to take this hopeful view, and the young genius for dandyism, like genius for the other arts, is too often persecuted by indignant and terrified relations.

A young man is never more certain of social success than at the moment when most other young men never mention him without saying that they "would like to kick him." As Thackeray observed in the case of Pendennis, that desire is the result of envy and of conscious humiliation awakened in manly bosoms. To provoke people so much is a token of superiority, and a prize of nonchalance. Nor is it social dandyism alone which thus irritates the rabble of decent fellows who have neither the vanity, nor the impudence, nor the strength of resolution to win distinction. Literary dandyism is also excessively annoying to the rugged hodmen of letters, the rapid picturesque writers, the half or quarter-educated persons who crowd the press, and carry their farrago of ill-assorted observations to an uncritical public. These industrious persons detest the literary dandy, the man who minds his periods, and regards the cadence of his sentences, and shuns stock illustrations and old quotations, as the social dandy avoids dirty gloves and clumsy boots. They howl at him as the little humorous street boys bully some small Etonian with a tall hat and a broad white collar, who has lost himself in Seven Dials. This antagonism naturally breeds more excess in literary dandyism, till the prose of some critics is as full of musk or millefleurs as the handkerchief of a popular preacher. Both parties are hardened in their ways; the rough and ready pressman becomes careless even of grammar, and trots out his quotations from Macaulay's essays more vigorously than of old. The prose of the exquisite begins to die away in aromatic nonsense, and his great genius tires itself to death in the hunting for rare exotic adjectives.

There have been schools of literary dandyism, there have been literary dandies, more robust than those of our time. Where we can show nothing much better (if Mr. Arnold belongs to an earlier generation) than Mr. Dowden and Mr. Pater, the great literary ages can boast of Plato, Catullus, Ronsard, Pascal, Horace Walpole, Sir Philip Sidney—nay, one might add, Buffon and Machiavelli. The two last named may be recognized as literary dandies because they respected the mere details of their literary labour. They were not of the sect that swears by tattered old slippers that toast at the fire, and ragged old jackets perfumed with cigars. They arrayed themselves in fine linen, if not in purple, before they sat down to describe the animal kingdom or give rules for the conduct of the Prince. The other writers, whose names we have taken very much at random from a crowd of the greatest authors, were dandies in style, exquisites in literary manners, precisians who turned away from what was commonplace in thought. They lived among slipshod writers, or in ages when all the world scribbled, or in times when style was disregarded, or not invented, and they set themselves to seek after grace and distinction. One can imagine how the Athenians, who were accustomed to the harsh and niggardly style of the old chroniclers, or the half-developed prose of Herodotus, laughed at Plato. That philosopher, if the portrait-bust of him does him no injustice, was very careful about the dressing and curling of his ambrosial locks. It is more certain that he must have given immense labour to the perfection of his style, to that instrument of extraordinary suppleness and grace which was derived from no model. The tradition says that the first clause of the *Republic* was found written in nine different ways in a note-book of Plato's. Whether the legend be true or not, the polish of his manners and the "educated insolence" of his wit sufficiently mark Plato as the great father and patron of all literary dandies. Catullus was not less a literary exquisite, with his airs of a spoiled wit, and his style, like his *novum libellum, arida modo pumice expolitum*. He naturally takes his place among *homines venustiores*, among gentlemen who care for the attire of their thoughts, who let the toga trail with a delicate grace, and despise all muses *inlepidæ atque inelegantes*. The famous Pleiad of France, the seven poets and critics of the sixteenth century, was a *coterie* of literary dandies. They made it their business to care for the way in which thoughts were presented; they devised lace and jewelry of style and of versification; and boasted of *ceste celeste maniere d'escrire*, a celestial transcendental manner of writing. Du Bellay ventured to discover that the old French of Froissart and Villon was *scabreux et mal poly*, and he and his friends were only the precursors of three or four successive schools of literary dandies in France. Who can consider the polish, the precision, the accuracy of that speech, its point and elegance, which make even dull writers seem witty, and fail to acknowledge that the work of the literary dandies has not been wholly wasted? Some advantage came of the conceit and careful periods even of the elder Balzac. And though the great Balzac of a

later time is more remarkable for vigour than elegance, it was at perfection that he too aimed. Plato did not rewrite his sentences more frequently; and the ruin of at least one publisher, by Balzac's expensive corrections of the press, proved how minutely careful he was to have his thought draped in the very best and richest language he could procure by incessant research. Our own revival of letters had its heroic dandy in Sir Philip Sidney, with his contempt for the slovens and grobians of literature, those "paper-blurrers" who, "by their own disgracefulness, disgrace the most graceful of *Poesy*." Sidney's censure of the dramatists of his time is a typical example of the scorn of the literary dandy of the nobler sort. "Now you shall have three ladies walk to gather flowers, and then we must believe the stage to be a garden. By-and-by we hear news of a shipwreck in the same place; then we are to blame if we accept it not for a rock. Upon the back of that comes out a hideous monster with fire and smoke, and then the miserable beholders are bound to take it for a cave; while, in the meantime, two armies fly in, represented with swords and bucklers; and then, what hard heart will not receive it for a pitched field?"

It would be easy to carry on the history of literary dandyism. The elegant disdain of Pascal, and his care for polished insolence of irony, might lead us to the reserved conceit and minute toil of Gray, and thence we might pass to the fine gentlemanly literature of Walpole. Modern France had its school of *dandysme* under the master whom Ouida and the Society journals call by the appropriate name of Beaudelaire. It might probably be demonstrated that literary dandyism has been salutary as well as irritating, that it has served as a protest against the lax language and outworn commonplace of the press-man and the poetaster, and that, like ordinary dandyism, it has made its disciples more distinguished among than beloved by their literary brethren.

THORNS IN THE CUSHION.

BELIEVERS in the operations of Nemesis must have found much agreeable and interesting reading in their newspapers during the past week; and the ingenious author of the *Happy Land* must, we should think, have received important hints for the *scenario* of a new drama. It is very doubtful whether, within the space of about forty-eight hours, three prominent members of an English Ministry ever cut such remarkably sorry figures as the Prime Minister, the Home Secretary, and the Postmaster-General cut between Saturday evening and Tuesday morning. The misfortunes of Mr. Gladstone and Mr. Fawcett bore, moreover, a painful similarity to one another, while that of Sir William Harcourt was, to do him justice, more of the involuntary order than those of his colleagues. Already we have had occasion to notice a singular mania for repentance in the minor members of the triumphant party, and Sir Rainald Knightley's truly diabolical suggestion that Mr. Samuel Morley should be put on the Bradlaugh Committee has given that particular jest a new lease of life. But the apologetic contortions of the minnows are naturally less attractive than those of the tritons. *Ab Jove principium* (which we do not mean to translate, as a student less attentive to the proper construction than to the separate meanings of the words and the facts of the moment might take it, "By Jove, this *is* a beginning!" but) let us begin with Mr. Gladstone. The stereotyped formula of comment on his remarkable letter to Count Karolyi has been that "probably no such missive has ever been signed by a Prime Minister of England before." We should be inclined to add a sincere hope that no such document will ever be signed by a Prime Minister of England again. If indeed it were possible to identify Mr. Gladstone with England, the letter would be productive of less amusement than vexation to good Englishmen. But, as it would be just as sensible to identify Mr. Gladstone with the country as to identify a fit of scarlet fever with the patient who had incautiously caught that disease, it does not so very much matter. The terms of the apology have been discovered by some connoisseurs in language to be "graceful," but the particular variety of grace which they display would be a little puzzling to indicate. The culprit begins by saying that when he accepted the Queen's commands to form a Ministry he made up his mind that he would not repeat, or even defend, the "polemical language" which he had previously used. Polemical language is a phrase rather neater than is usual with Mr. Gladstone, and we hope that the next offender who appears at Bow Street charged with sins of the tongue will remember it. But it is a little odd that a statesman should confess to indulgence in language which, by his own admission, is utterly unsuited to the part he may have to play a few days after using it. Then comes the apology proper, and an assurance of Mr. Gladstone's "cordial respect for the efforts of the Emperor"—the efforts, be it remembered, which he had previously described in polemical language as those of the ruler of a country "which has been the unflinching foe of freedom," and of which "it was impossible to say that it had done good in any spot of Europe." This lands us in a pleasing dilemma. Either Austria is not the unflinching foe of freedom, &c., or else Mr. Gladstone has a cordial respect for the unflinching foe of freedom. After this, in his usual lengthy fashion, Mr. Gladstone hints that, if he had been supplied with a declaration of the purity of Austria's intentions, he would never have talked polemically. Now, by his own description, he was at the time of speaking only a private person fighting for his seat. From which we gather that it was the duty of the Emperor of Austria to supply every English candidate with a categorical statement to the effect that he, the Emperor, intended to keep his pledges. The "grace" of this attempt at self-excuse is peculiar. But it has long been a characteristic of Mr. Gladstone's apologies that they never allow himself to have been really in the wrong. In consequence of this custom, several birds are invariably killed by these stones. The offended person is not unduly propitiated, and the apologist has the advantage of having to apologize, with the additional awkwardness of seeming to grudge his apology. Still it would be wrong to quarrel with so great an authority on the art of speaking in haste and repenting at leisure as the present Prime Minister. The garden space allotted to his official residence is not extensive, but it is to be hoped that he has already sent to his new constituents for a supply of the best Musselburgh leeks. The guests at the first Ministerial dinner next Wednesday are sure already of at least two dainties. Mr. Gladstone is known to have no fancy for whitebait. But of cock-a-leekie there should be good store, and a prime humble pie is already in cut at Downing Street.

The Postmaster-General has, so to speak, eaten his leek with a difference—a difference which may surprise those who, disagreeing with Mr. Fawcett in politics, have hitherto had in many ways a high respect for him. Mr. Gladstone's original crime was simply the indulgence in indecent and violent language, which is with him "pretty Fanny's way," and the fault of his apology lies chiefly in the awkward and unctuous verbosity which is also natural to him. But Mr. Fawcett's case is not so pleasant a one. Indeed, to describe it properly, we are almost afraid we should have to borrow the vocabulary of the Chancellor of the Duchy of Lancaster. Mr. Fawcett goes to Hackney, describes the courtesy he has himself received from members of the late Government, and then goes on to charge that Government with what, had it been the fact, would have been not merely an act deserving impeachment in days when impeachments were, but one which would also have been impossible to any body of gentlemen or any individual gentleman. After which he was good enough to promise his "assistance" to Lord Hartington in looking after Indian matters. If the Indian Secretary on reading this speech did not with emphasis express the wish that Mr. Fawcett would mind his own business, the House of Cavendish has in its heir a model of Christian meekness. The story which Mr. Fawcett must have got from some backstairs tittle-tattle of clerks was an utterly and ludicrously false one, and received a flat contradiction from Mr. Stanhope with great promptitude. Thereupon Mr. Fawcett apologizes in language which, though not so involved as Mr. Gladstone's, far surpasses the latter in ungraciousness and impropriety. Mr. Fawcett tries in a roundabout fashion to fix once more upon his adversaries the charge which has been shown to be utterly baseless, and "regrets having blamed the Government for not communicating the information" which they had not got. Mr. Fawcett's sorrow certainly does not seem to weigh heavily upon him, and he does not seem to understand too clearly what it is that he ought to regret. However this may be, the duet with his chief is a very sufficient one, and the country, we have no doubt, is proud of the powers of the executants. The Congregational Unions which pass resolutions hailing "the new legislative and administrative era" may have this little exhibition respectfully commended to them. In the hurry of the moment Mr. Samuel Morley forgets his God; in the hurry of the moment Mr. Gladstone forgets history, statesmanship, and international courtesy; in the hurry of the moment Mr. Fawcett forgets the Ninth Commandment. *Redeunt Saturnia regna.* The leader of the new era first makes a blustering attack and then a grovelling apology; and one of his aides first utters a slander and then, forced to retract it, endeavours to make out that it was not so very much of a slander after all. A Radical wit, in the elegant polemical language affected by that party, once designated Her Majesty's late advisers as the Ministry of All the Liars. It was a fortunate anticipation, for otherwise the phrase might have found a different application.

We must almost apologize for classing Sir William Harcourt's misfortune with these. The thorn in his cushion is something of a bull, for the Home Secretary's particular woe is that he has not got a cushion. He is the dark star of the Government Pleiad, the wandering Achamoth of the Ministerial Pleroma. But his mishap, if more ludicrous than those of his colleagues, is also more respectable and more reparable. A Ministry which cannot find seats for its chief members is not necessarily disgraced thereby; a Ministry whose members alternately make false statements and retract them abjectly or grudgingly may perhaps go near to be thought so shortly. Yet at the bottom Sir William Harcourt's troubles have had the same cause, though not quite the same complexion, as his friends. The mania for polemical language which for some years has affected almost all the chiefs of the party (Lord Hartington being almost the only exception) has wrought all this woe. If the Home Secretary could have refrained from vulgar exultation and coarse abuse in his hour of triumph, he would probably not have had to suffer an indefinite period of specially inconvenient defeat. If Mr. Gladstone could have grasped the fact that anybody who did not wish him success was not necessarily the offscouring of the world, he would not, at least on this particular occasion, have been laughed at in every capital of Europe, and have proclaimed his hopeless incapacity for statesmanship simultaneously with his assumption of the reins of State. If Mr. Fawcett could have waited a day or two, or have minded his own business, he would not have had to brook the plain words—"That is not true"—which leave a sting in the soul of every gentleman. Such little accidents as these can of course have no effect—no immediate

effect that is to say—on a majority of some three or four score and a Cabinet of all the virtues. But still it might be well for the Government to put some restraint upon their undoubted capacity for making themselves ridiculous, and perhaps a little more. If they force the pace in this fashion, even they must find it impossible to keep it up. No Cabinet, no Government, can serve up a member hot as the laughing-stock of the country every morning for an unlimited period. A Home Secretary as seatless as a cherub, defeated by the very party over whose utter overthrow he has been crowing his shrillest; a Prime Minister proclaiming himself to have been a windy talker about things on which he was not "supplied with the information" which everybody else had, and dragging his country through the dirt of an apology for which there never ought to have been any cause; a Postmaster-General pumping clerks of Government departments for information like a private detective, and pushing his own colleague out of the way to make false platform revelations on matters within that colleague's province—these are characters and situations of a strength which no dramatist can sustain through the piece. And even if the superhuman power of the chief in this respect should continue to inspire his subordinates with unwonted efforts—if, for instance, an odd little story about a certain interview of a certain Under-Secretary with a certain correspondent should turn out to be true—the laughing powers of the spectators will soon be exhausted. Man may be a risible animal, but none of his faculties are capable of indefinite exertion. It is even just possible—we beg the pardon of the Congregational Unions for the suggestion—that amusement might in time give place to another feeling. It did so, if we remember rightly, once before, indeed not much more than seven years ago. Innocent self-revelations of the Gladstone-Fawcett kind are apt after a time to create a dim notion even in the Congregational mind that there is something wrong. "The Lord's lambs mun' play," as an indecorous story has it. Mr. Gladstone and Mr. Fawcett are undoubted "brébis du Seigneur"; but they are surely beginning their gambols with injudicious energy and speed.

THE MUSICAL MAN.

MR. DU MAURIER has of late devoted himself in the pages of *Punch* with great ability to holding up to the derision of the world the silly side of æstheticism. Would-be poets and painters, *dilettanti* and *cognoscenti*, are the victims of his pencil. At times he has attacked the musical amateur, but not with the sting which he employs in other cases. Perhaps it might be argued that there is hardly the scope for ridicule in the case of musical amateurs that exists with regard to the class of people Mr. Du Maurier generally deals with; but the real reason is to be found in quite another quarter. If there is a subject upon which society considers it has a right to speak, it is music. Any amount of nonsense, any quantity of dogmatic assertion, any foolish jingle of empty words, passes in society as musical criticism. Knowledge of the subject matters not, provided the expressions of approval or disapproval are sufficiently vehement, and downright abuse only adds piquancy which the vulgar mind mistakes for satire. It always was and ever will be so. The artist will sneer at the critic's ignorance, the critic at the artist's. There is nothing new in it, and had the case remained so there were no necessity for our present remarks.

Formerly this kind of musical criticism was mainly confined to the newspapers, but now some able professor of the art is to be found in every drawing-room. The musical man, as he is called, as if in unconscious recognition of the superiority of the true musician, is far from the rarity that he was at one time. There is hardly a hostess in London who could not produce one at a few moments' notice to delight the ears of her guests with his views upon music. He is, to outward appearance, much the same as his brethren in the other arts. A plentiful lack of hair on his pallid face, with an abnormal development of the same on his head; a languid air, indicative of the earlier stages of consumption; a sad expression of countenance, as if weary of the ways of men; a looseness of collar and necktie; an affectation of poetical abstraction; and a general effeminacy in movement and posture, are all present in the musical man. So far he is inoffensive enough, and may even become amusing; but it is when we are brought face to face with him that the disagreeable characteristics make themselves apparent. As far as we are able to judge, he has three distinct ways of addressing an interlocutor —the humble, the patronizing, and the insolent. The first he employs whilst conversing with a musician, when his remarks are chiefly confined to monosyllables of affirmation or negation; the second in his intercourse with ladies generally; and the third to all those whom he considers his inferiors, and this is a very large proportion of the human race. As to his claim to the title of musical, it will generally be found to be the slightest. He plays the pianoforte, and sings with more or less success little French or German songs, and will, if asked (he needs no pressing), give his audience a little *chanson* of his own composition. As far as talk about music is concerned, he will talk to Doomsday; but his remarks are dogmatic and void of argument. Most musical men have their musical heroes, though we have met with some who honestly affirm that they are their own heroes. Brahms, Wagner, and now Hermann Götz, can each boast of their musical men, who cannot converse for five minutes without dragging in their own special heroes by the heels; but perhaps the most exasperating specimen of this type is he who has a musical hero that no one has heard of before, or, at least, that you suppose no one has heard of before. Not to know the writings of Herr Ignatius Brausekopf is a sin that you will not easily be forgiven by such a one, and the full vials of his wrath will be poured out on your devoted head. His dogmatism will show itself in all its terrible vigour. Do you think Rossini a great musician? You will be met with invective against the Italian school. Mozart a master of his art? You will be answered that you are an advocate of tunes. And here, in passing, it may be remarked that this special form of musical man avows himself almost an enemy to melody. Perhaps you may express a strong liking for the intense power of Beethoven; you will immediately be met with a patronizing assent, only to be flooded with praise of the hero Brausekopf. And, for all you know, the poor man whose name has thus been thrust upon your attention may be a most worthy and rising musician who is personally as unknown to the musical man as to yourself. To such nonsense as this is one subjected, and in protest we write, Let every one beware of the musical man if he would enjoy himself at any social gathering. The ignorance of the creature is colossal. One of the tribe, in discoursing in his usual self-opinionated way of the rendering of Beethoven's *Waldstein* sonata some time ago, persistently called it the "Wallenstein" sonata, in spite of charitable attempts to make him see the mistake he had fallen into. Our forefathers were apt to discourage all attempts at the dissemination of musical knowledge among men, giving as their reason that music was only an accomplishment fitted for women and for fools. Had they any foreknowledge of the advent of the musical man?

Who is responsible for this new and rapidly increasing genus? Sorrowfully it must be admitted that women are the fosterers of this unpleasant type of man. Formerly, in fact quite within the memory of middle-aged men, to be unmusical was not considered a sin. Now alas, it is. Not to be able at least to talk upon the subject will, if it does not totally extinguish, at least cast a shadow over your conversational powers. And this is the decree of ladies in society. It is doubtless an easy way of paying a social debt to invite a host of friends to an uncomfortable crush, where each one, after having saluted the hostess, endeavours with all the alacrity at his command to escape from the miseries impending; but such crushes become irksome to the average mortal, and it was necessary to enliven them with some excitement, and what more pleasant than music? Thus music became fashionable. The rich paid heavily for professional performers, but what were the needy followers in their steps to do? The musical man became at once an attraction, and the competition for him increased to a mania. Now this personage, being a Brummagem article, was easily manufactured to meet the demand. Given a certain amount of assurance and a nimbleness of finger at the pianoforte, the rest might be safely left to the tailor, barber, and haberdasher. Thus sprang into life the musical man as we now have him. Of course it is only human nature that he should suppose he really has the ring of true metal about him, and even if he were to fall into a momentary fit of modesty and fancy that he was not the genius he supposed himself, society—that is, the ladies—would not allow him to undeceive himself. There was no help for it; so the musical man became society's hero even in spite of himself. Fashion demanded him, and he was produced. This would not have been so had the fair hostesses who cultivate the music mania lived in the time of their forefathers, when music was studied as an art, not as an accomplishment. Sad as it may seem, it is nevertheless true that, although the taste, as it is called, for music is more general, the study of the art is much more rare than formerly. We speak, of course, of those who do not make music a profession. The accomplished young lady of the present day, who plays the most difficult music with facility, could not do what probably her grandmother, let us say, considered a matter of no inordinate difficulty. For instance, we have known old ladies transpose at sight, read a figured bass or score, and show themselves in every way acquainted with harmony and thorough-bass—words which to the ordinary accomplished young lady of our time mean an amount of knowledge scarcely to be attained in a lifetime. In those days men travelled by stage-coach and not by steam, and it appears they studied earnestly and were not driven by fashion. The fact is that those who wished it were educated in music, and those who did not wish it left it alone. Of course there was no room for musical men. Times like those may perhaps come again when a sufficient amount of rope has been granted to these gentlemen to hang themselves, but meanwhile we have to submit to their dictation. As things stand at present, however, five minutes' conversation with any of the ladies who encourage him will show you what the musical man's power is. Even if you are not favoured with his name, you will find that you are considered a fool for not thinking as he does. That he is a tyrant to his patronesses we doubt not, but we fear that even under these circumstances they value the appearance of culture too much to rid themselves of this useful purveyor. We do not know that the existence of this class of men does any permanent damage to the cause of music, but it accounts in a great degree for the large amount of nonsense that one hears people talk upon the subject, and it is a pitiable thing to see persons, otherwise in their right minds, listening to and applauding such rubbish as these musical men give forth. Prigs there ever will be, and they are sufficiently irritating companions, but still they are mostly tolerable in comparison with the musical man. His priggishness is combined with a contempt for his sex and a disgusting effeminacy. We are apt to inveigh against the affectation of manliness in a

woman; but how much more detestable is the affectation of womanliness in a man!

Believing, however, as we firmly do, that there is some use in nature for all created things, we set ourselves to work to find out in what possible way the musical man fulfilled his destiny. For a long time we despaired, and began to think that at last we had found one exception to an otherwise universal truth; but at last we were rejoiced to discover that the musical man, like all other things in creation, has his sphere of usefulness. Indeed, judging from the answers of many ladies of whom we have inquired, he is a veritable treasure, an unpaid private secretary, a confidential agent, a general trouble-saver, the one thing needful to the over-worked lady of fashion. He will arrange, we are told, a dinner-party, write all the invitations, nay even instruct the French cook in his own tongue. We have met with some musical men, it is true, whose only recommendation is that they are veiled in mystery. "Who is he?" we have heard asked. "I don't know; but he is charming, and so useful!" comes the answer; "and you meet him everywhere"—the latter part of which we can endorse sorrowfully. There are rumours that the musical man has been known, through sheer gratitude, to be the medium of introducing a wealthy but somewhat vulgar patroness into those regions which take the place of paradise to the opulent *parvenue*. Need more be said? Indeed he has his uses, this gentle, insolent musical man; it is only to be wished that he would stick to his last and leave music to musicians. We fear, alas! that that is just what he will not do.

THE FRENCH STAGE.

THE opposition to *Daniel Rochat*, M. Sardou's play at the Comédie Française, has gradually diminished, and the can now be judged on its merits. When we saw it a short time since, any loud expression of opinion, whether favourable or adverse, was rarely heard. It is curious that a people so dramatic as the Parisians should not be able, when their religious or political convictions enter into the question, to separate the author from the characters. They do not wait to see what he intends to do with his personages, but they continually interrupt the action, according as the sentiments expressed give them pleasure or pain; and in newspapers and in conversation the language used is such that one would almost think that M. Sardou had been giving a lecture instead of writing a play. The following, for instance, is one of the passages that raised the loudest storm:—

FARGIS.

Ah! ça! voyons: entendons-nous une bonne fois. C'est donc à toute idée religieuse que vous en avez? Et voilà donc votre programme? Plus de religion.

DANIEL.

Et pourquoi faire? Est-ce que ma raison accepte ce qu'elle ne peut pas contrôler? Est-ce que j'admets que l'on règle toutes les pensées et tous les actes de ma vie sur de pretendues vérités dont on ne peut me fournir aucune preuve? Rêveries, divagations, tout cela! Le positif, le réel, le voilà! La terre où je suis né, où je vis, où je meurs! Que mon intelligence s'applique à me rendre ce séjour forcé le plus agréable pour moi; c'est mon droit! Le plus profitable aux autres! c'est mon devoir! Et je serais halluciné d'aller me rêver une destinée chimérique dans les nuages, quand elle est si bien marquée, d'ici à là, de mon berceau à ma tombe.

FARGIS.

Une société sans Dieu.

BIDÂCHE.

Il y a assez longtemps qu'il nous gêne.

FARGIS.

Il n'y en a plus, c'est convenu! Mais du moins ne commets pas dans ta maison la faute impardonnable que tu as commise ailleurs. N'y soulève pas la question religieuse. Tu as une femme éclairée, instruite, dont la religion n'a rien que de [illegible] Et tu vas compromettre tout ton bonheur pour ce malheureux temple! Eh! n'y vas pas pour toi, vas-y pour elle!

BIDÂCHE.

Opportuniste!

DANIEL.

Une lâcheté, tout bonnement, que tu me conseilles!

Here are three sets of opinions—the coarse and somewhat vulgar atheism of Bidâche, Daniel's faithful friend and most obedient servant; the more polished materialism of Daniel himself; and the common-sense liberalism of Fargis, who has preserved some shreds of belief, and is most anxious, on the grounds of private peace and public tolerance, that all the world should be left to believe or not as they please. It is at first uncertain to which of these views M. Sardou himself may lean; although it seems a matter of certainty towards the end that he is of the opinion of M. Fargis; but the orthodox were deeply shocked to hear infidel sentiments expressed so crudely, and their opponents resented with equal violence the possibility of toleration.

As a piece of dramatic work, it is not likely that *Daniel Rochat*, notwithstanding two or three excellent situations and a brilliant dialogue, will have a lasting reputation. The author is not one of those rare writers who can give a permanent value to that which is written to serve a particular purpose. One merit the play undoubtedly possesses, and it is precisely a merit in which many of M. Sardou's most successful pieces have been deficient. The characters are real men and women, not lay figures pulled by strings of the author's own making. In Lea Henderson, too, he has drawn a real English girl, full of love and tenderness, but firm in her adherence to a creed which is for her a reality, not a form. The first two acts are excellent, but the last three, which belong to a pamphlet rather than a comedy, are, it must be confessed, exceedingly dull. Everybody discusses the question of the civil and the religious marriage, in turn, and at considerable length. To an Englishman it is inconceivable that Léa should not have known Daniel's real opinions after the opportunities she had had; and, secondly, on the given conditions, it is equally inconceivable that Daniel should have wounded her deepest feelings by declining a ceremony which to him would have been devoid of all meaning. To the first of these objections there seems to us to be no reply; but to the second Frenchmen answer that a man in Daniel's position could not have entered a church or submitted to any religious ceremony. This situation it was M. Sardou's avowed intention to set before his countrymen in the clearest possible light. He did not intend Rochat to be at all an unusual person—as he seems to us to be—but only a leader of the extreme party now in power, whose happiness is wrecked by the exigencies of his political and social creed. The title of the piece might well have been "Extremes." It is throughout admirably acted. Mlle. Bartet realizes to the life the author's conception of Miss Henderson, than which we can give no higher praise. M. Delaunay, who plays Daniel—a part wholly out of his line—shows more clearly than ever how great a dramatic artist he is; and M. Thiron makes of Bidâche the coarse and slightly vulgar personage which is requisite for the sake of contrast. Mlle. Jouassain is delightful as the old lady with a mania for deeds of charity and the distribution of tracts; and the whole is charmingly enlivened by the somewhat romping loves of Esther Henderson and Casimir Fargis, parts which are played by Mlle. Barretta and M. Baillot.

Hardly less interesting than *Daniel Rochat* is a revival of *Britannicus*, in which Mlle. Favart plays Agrippine for the first time. The talent of that really great artist, which it has been the fashion of late years to decry, was never exhibited to greater advantage. She seems all at once to have corrected the defects of her voice, and to have given to it depth and richness; while her expressions and her gestures in the scenes with her son bring back before our eyes that imperious dame of whom Nero stood in awe, and from whose dominion there was no escape except by assassination. The Nero of M. Mounet-Sully has merits, but, like all he does, is sadly unequal; and in the reconciliation with his mother, when he bends over her hand to kiss it, the measured jerkiness of his movements compelled even the solemn occupiers of the stalls to undisguised laughter. M. Volny is Britannicus. He is of the age required for the part; but cannot be said to possess any other merit. Youth alone is not sufficient for success in the impersonation of a youthful character.

Les Noces d'Attila is the title of the four-act drama which M. Henri de Bornier, the author of *La Fille de Roland*, has just produced at the Odéon. The piece is full of fire and movement, and the verse, in which it is not difficult to detect the influence of Victor Hugo, is sonorous and picturesque. The author, however, is a poet rather than a dramatist; his characters talk, but they do not act; and he has an unfortunate habit of getting rid of them when they have uttered a sufficient number of fine lines. In treating his subject he has followed closely the ordinary narrative of Attila's marriage and death, with this difference, that he makes him fall by the hand of Hildiga, a Burgundian princess who, like a second Judith, avenges the ruin of her country. Attila is played with much picturesque vigour by M. Dumaine; and Hildiga by Mlle. Rousseil, who however lacks "sympathy"; but the honours of the evening are for M. Marais, who enacts Walter, a young French general in love with Hildiga. He comes to Attila's camp to protect her; but, strange to say, the author kills him at the very moment when he might have been of some use to the lady. Into his mouth are put all the patriotic speeches; and, as nature has endowed him with a fine voice, which he knows how to manage, and an attractive person, which he drapes becomingly in the most gorgeous of costumes, he becomes an object of much interest to the audience. For it must be understood that Attila is Germany, and Walter France; and all the fine speeches of the latter, while containing no word that the Censure could object to, have an undercurrent of meaning which the public is not slow to seize. Take, for instance, the following lines, which are besides a good example of the author's style:—

ATTILA.

Donc, pour vaincre Attila tu crois qu'il suffirait
D'un seul homme?

WALTER.

A Lutèce une femme l'a fait!
Les hommes voulaient fuir devant toi—sur la grève
Une femme parut, son nom est Geneviève.
Elle leur dit, "Partez! mais nous vous le jurons,
Epouses, filles, sœurs, mères, nous resterons!"
Ils restèrent. Dès lors, la crainte et l'égoïsme
S'enfuirent emportés d'un souffle d'héroïsme,
La vaillante cité de fer se hérissa,
Et quand Attila vint, il eut peur et passa!
Eh bien! j'imiterai la sainte prophétesse,
J'irai trouver là-bas les soldats de Lutèce,
Je leur dirai: Je viens, si je n'ai trop d'orgueil,
Dans vos murs consacrés par la gloire et le deuil,
Créer le point d'appui du monde qui chancelle;
Soyons les artisans de l'œuvre universelle;
Qu'ils s'appellent Gaulois, Franc, Burgonde, ou Germain;
Aux peuples éperdus montrons le vrai chemin;
N'attendons pas les Huns chez nous, comme naguère,
Dans l'antre de ces loups allons porter la guerre,
Et les vieux étendards, dont nos temples sont fiers,
Joints aux jeunes drapeaux, sauveront l'univers!

The theatres where long sensation melodramas are usually performed have not been fortunate of late. The Ambigu, however, has revived with some success one of Frédérick Lemaître's most famous creations, *Robert Macaire*. The original two-act melodrama is played as a prologue to the farcical comedy which Frédérick produced after the great success of his fantastical creation. M. Gil Nasa plays Macaire; and though he has to contend with recollections of his great predecessor, is as successful as could be expected in pleasing his audience. The Porte St. Martin is giving *Les Etrangleurs de Paris*, adapted from M. Belot's novel at tremendous length, with all the realistic effects that are so delightful to the Boulevard. It appears, however, to be hardly more than a *succès d'estime*. At the little Troisième Théâtre Français, on the other hand, a well-merited, and let us hope permanent, success has been achieved by a five-act drama with the strange title *Chien d'Aveugle*. It is a story of modern life, dealing with three persons only, one of whom is blinded by his mistress for fear that he should abandon her. The fifth act is unnecessary, but the first four are excellent, and the interest, painful as it is, never flags for a moment. It is a first work of two authors, one of whom is an actor at the Gymnase. His professional experience probably accounts for the cleverness of the principal situations; but it should be added that the development of the characters is natural and artistic, and that the dialogue is fresh and original.

There is yet one matter on which we have a few words to say. Mlle. Sarah Bernhardt has thought proper to leave the Comédie Française. The dramatic critics had the audacity to find fault with her performance of Donna Clorinde in M. Emile Augier's fine play, *L'Aventurière*. On reading the articles of these faithless persons—of whom the Abdiel was, of all men in the world, M. Zola—the injured lady no doubt felt an intense desire to revenge herself on some one. Maggie Tulliver, in *The Mill on the Floss*, kept a fetish for these occasions, which she used to thrash until she had recovered her temper. Apparently Mlle. Bernhardt is not so prudent. She looked about for a victim. A body of critics strong in their unanimity is invulnerable, even to an actress in a rage. Not so, she thought, would be M. Perrin, the official head of the Comédie, a man as innocent in the whole business as ourselves. She probably expected, if she thought at all—for she admits in one of her numerous letters that the next day she was as much astonished as anybody at the action she had taken—that he and his company would approach her on their knees, in humble supplication, as gentlemen and ladies in mediæval pictures approach their patron saints, and beg her to return. She must have been singularly disconcerted at the course he actually took. He wrote to M. Augier a letter which gives a singularly agreeable picture of the relations between authors and manager in the first of French theatres; and called the Committee together to consider the legal position of the recalcitrant actress. M. Augier, in a letter as generous as M. Perrin's, entreated them to deal gently with a lady who practised so many arts equally well (or ill), and to reserve their severity for talents less universal and more serious. The Committee, however, felt themselves unable to take this lenient view of the case; nor, on the evidence before us, can we see how they could have acted otherwise. According to M. Perrin's formal statement in the letter above referred to, Mlle. Bernhardt is wrong in her facts. The piece had been rehearsed eighteen times; and, if she had not thought proper to take advantage of those opportunities for making herself perfect in her part, it was her fault and not his. Again, she had twice announced herself as ready to play—on Saturday, April 16; on the Tuesday before, and again on the Friday after, the final rehearsal. Lastly, after the performance, she appeared delighted with her reception, and spoke of her intention to play still better on the following Tuesday. Of course, in a theatre like the Comédie Française, no actress can be allowed to come and go at will. The rules may be severe, but the position is one of exceptional advantages; and those who enjoy them must submit to the control they impose, or be content to bear the penalty fixed by law for their violation of their engagements.

We have been at the pains of investigating this amusing quarrel because we have a sincere respect for the management of the Comédie Française, and a warm admiration, up to a certain point, for the undoubted genius of the wayward lady who has put herself so completely in the wrong. It is the old story of the overstrained string. Not content with a reputation as an actress which a year or two since promised to rival that of the greatest names in the art, Mlle. Bernhardt strove to be distinguished in painting, sculpture, and literature. She became the spoilt darling of a whole coterie of flatterers. Newspapers that live on the doings of the successful or the eccentric had her followed about, and regaled the public with details of her escapades, and reports of her witticisms. The folly of London society last summer completed the work that Paris had begun. With a repetition of that unseemly adulation in view, she was overtasking her delicate physical organization in a feverish preparation for it. To her ordinary occupations she added rehearsals of long and unfamiliar parts. Meanwhile, that which ought to have been her real work, the careful study of parts entrusted to her by the Comédie, was the last thing she thought about. For more than a year she had not appeared either in a new piece or in a revival. It was evident that the quality of her work was degenerating. Her voice was not what it had been. It was only too clear that her heart was not engaged in the characters which she might be called upon to represent. Her eyes wandered about the house, and her by-play became unmeaning. In a word, she had ceased to impersonate, and had begun to act. M. Sardou was too wise, notwithstanding her reputation, to let her play Miss Henderson in *Daniel Rochat*. And when she did attempt Donna Clorinde, it was plain that she was not at her best. The least severe of her critics admits that any other actress would have been received with a silence that would have told her how completely she had failed. Her Theatre is now showing her that it can do without her. Mlle. Croizette has appeared with success in the very part in which Mlle. Bernhardt failed; Mlle. Bartet has been welcomed with vociferous applause as the Queen in *Ruy Blas*; and though probably she is not what Mlle. Bernhardt was, when she chose—for it was one of her very best impersonations—it must be remembered that Mlle. Bernhardt herself did not play the part at the Odéon in 1872 as she played it at the Comédie Française in 1879. It is sad to think that when she repents, as of course she will do before long, it will be too late. It is not likely that the Comédie, which of all theatres in Europe most dislikes a star, will open its doors to her. She will soon discover that she has lost more than the Theatre by her impetuosity. How will she be able to perform any of her most successful characters without the help of those distinguished artists who formerly surrounded her? What will her Mrs. Clarkson in *L'Etrangère* be without M. Coquelin and Mlle. Croizette; her Marie de Neubourg without M. Mounet-Sully, M. Febvre, and the rest, whose talent gave to the Court of Spain that colour which aided so remarkably her touching delineation of the neglected princess whose heart was frozen by its formality? She may possibly achieve a partial success in London, where the French language and French literature is imperfectly understood, and where the audiences of such performances as hers are likely to be fashionable rather than intelligent; but in Paris it will be different. She is not strong enough, artistically or physically, to be the sole attraction of a theatre. Other artists have left the Comédie in a huff, as she has done; but not one of them realized their fond hopes of independence and success. Mlle. Sarah Bernhardt is not likely to succeed in an enterprise in which Rachel herself failed miserably. With the Comédie she might have been almost anything; without it she will be nothing.

This may be a convenient occasion for noticing an odd and not very sensible performance which took place on Monday last at the Prince of Wales's Theatre, assuming the shape of a representation by English actors in French of *L'Aventurière*, the piece connected with Mlle. Bernhardt's retirement from the Français. Miss Geneviève Ward appeared as Donna Clorinde, and showed a very remarkable command of French accent and rhythm; nor was her acting without considerable merit. Two French players, Mlle. Hébert, or Herbert, and M. Marius, appeared respectively as Célie and Don Annibal; and their French, although M. Marius showed some traces of his long residence in England, offered an odd contrast to that of the performers of the other parts. M. Marius's acting was exceedingly clever. It must be said that the whole performance of the English players was, as a *tour de force*, creditable; but we cannot conceive what good end is served by such an entirely inartistic undertaking. The praise bestowed upon it must at best be of that kind which might be given to a company of actors who chose to go through a serious drama perched on stilts, assisted by two people walking in the usual way, and succeeded in avoiding a dangerous fall.

OUR LONDON CORRESPONDENT.

WE called attention some little time ago to a curious and apparently authentic account in *Macmillan's Magazine* of "the Genesis of the *Times*." The present number of the same magazine contains, though not from the same hand, a record hardly less curious and equally circumstantial of the origin, development, and present condition of the London Correspondent of the provincial press, whose power, if Mr. Wemyss Reid may be trusted, has increased and is increasing, though he does not add that it ought to be diminished. The influence of the provincial newspapers, which Mr. Gladstone is never tired of proclaiming, has received a fresh illustration in the result of the late elections, and this seems to have suggested the subject of Mr. Reid's paper. He speaks throughout in a tone of assured confidence as being in full possession of his facts, and intimates again and again that if he chose he could say a good deal more, "but a sense of discretion compels me to preserve a discreet reticence." For the accuracy of his details we cannot of course vouch, but his natural history, so to speak, of this particular development of species is certainly amusing, and has every appearance of being based on fact. That the London Correspondent of twenty or thirty years ago belonged to "a despised order of men" there can be no doubt. The late James Hannay summarily dismissed them as men "who do for money what old women do for love," whose function is "to gossip and retail gossip at so much a column." And the reproach is candidly allowed not to have been an unmerited one. It indicated fairly enough the kind of literary garbage—or "tawdry rubbish," to adopt a phrase of Mr. Reid's—wherewith the omniscient Correspondent of the *Little Pedlington Herald* periodically regaled his readers, who very often were quite content to accept for gospel whatever he was pleased to tell them. And he told a good deal:—

He could tell you the precise words in which Prince Albert had expressed his satisfaction on receiving a certain piece of intelligence; he knew that the Prince of Wales—then verging upon his tenth year—was

already giving trouble in the matter of cigars; he had the latest jest of Lord Palmerston, or the newest display of Lord John's jealousy, at the point of his pen; and as for the "secrets" of the clubs, he had such a mastery of them as must have filled club-men themselves with amazement. He "lounged"—that was his favourite phrase—from the Carlton to the Reform, and from the Reform onwards to the Athenæum or the United Service, apparently having the run of all those august establishments, and being on the terms of greatest familiarity with everybody in them. He was a "silent member" of the House of Commons, and favoured you with strange anecdotes of the smoking-room and the terrace; he was at home behind the scenes in all the theatres in London, and talked of the leading actors and actresses of the day by their Christian names; he was the bosom friend of this or the other great novelist, and furnished the world with remarkable particulars concerning the Oriental luxury in which his friend and patron lived.

As a matter of fact he was probably a gentleman who, in modern slang, was "out of it" altogether, who had never entered a club in his life, scarcely knew a single statesman of the day by sight, and whose thrilling paragraphs were a mixed compound of his own internal consciousness, and "the dull chatter of third-rate taverns." There was clearly, as Mr. Reid observes, nothing sinful, or indeed unnatural, in the desire to know something more of public men and public matters than could be gathered from reports of the Parliamentary debates. And it may be true that "the essayists and gossiping diarists" of the last century to some extent catered for this craving, which, as we learn from Aristophanes and Juvenal, in a still earlier age, when the printing press as yet was not, found its gratification in the gossip of the barbers' shops of Athens and Rome.

But at last "this miserable kind of impostor" who used to trade on the curiosity and credulity of the public began to be found out, and about fifteen or sixteen years ago—Mr. Reid is precise in his dates, and he fixes the commencement of the revolution in "the year 1865 or 1866"—the old order changed, giving place to new. At that epoch—for it was quite an epoch in the career of Our London Correspondent—one or two leading Scottish journals hired special telegraphic wires, which were placed at their exclusive disposal from 6 P.M. till early next morning. It soon however became evident to them that a special wire was of no great use without a special telegram to communicate, and accordingly branch editorial offices came to be established in London, whence arose the new order of Correspondents. But meanwhile a great change had taken place in the relations of the London daily press to the political leaders of the day. When Mr. Barnes was editor of the *Times*, he did not belong to a single London Club, and held no friendly intercourse with the leaders of either political party. But his successor, Mr. Delane, who was courted for his own sake as well as from his influential position, became the recipient of Lord Palmerston's confidence as Prime Minister. He used his information, however, on the principle of *ars est celare artem*, not to produce an impression of special knowledge, but in order to suggest or predict what he knew was in fact going to be done, and thus gained a reputation for sagacity and influence for the paper which could both perceive what was necessary and enforce its convictions on the Government. But that reputation of course declined as the *Times* began to lose its monopoly, and the representatives of provincial journals came to the front. At first indeed they were rudely repulsed, if not positively insulted, by the Under-Secretaries and Lords of the Treasury on their promotion to whom they ventured to appeal. But their pertinacity was indomitable, and if Mr. Reid's information is to be trusted—and he assures us that he knows much more than he cares to reveal—by no means always of the most creditable kind. "Repulsed by the master, the London Correspondent had recourse to the man"; he was not above touting for odds and ends of news among Government clerks and copyists, and, if these failed, there were postmen and messengers to fall back upon. Mr. Reid even assures us, of his own knowledge, that the Home Secretary's private desk was upon one occasion opened by a false key, to discover whether a certain important document had or had not received the royal signature. Moreover, as several country papers had taken Government clerks into their pay, they became the organs of the grumbling and tittle-tattle of the lower classes of the Civil Service. And the Correspondent found another means of picking up stray scraps of information in the practice of "lobbying," that is, getting into the lobby of the House of Commons through introductions to members, and there interviewing his M.P. friends. This led Lord Charles Russell, then Sergeant-at-Arms, to issue an order in 1869 excluding all representatives of the newspapers from the lobby, which is now however overrun with them. But in the same year the provincial press achieved what Mr. Reid considers its crowning and decisive triumph. And it happened in this wise.

Mr. Gladstone's reforming Government had just come into office, and the new brooms were making a clean sweep everywhere. But as one official abuse after another was assailed and doomed, the outcry of the officials naturally grew louder and louder, and they as naturally took advantage of their connexion with the press to air their grievances before the public. The answer of the new heads of the different departments was to appropriate to their own use the weapons of their assailants. Their method of procedure is detailed in the following very curious and circumstantial narrative:—

One day in the beginning of 1869, when as yet the new Government was barely beginning its work of reform, the "London Correspondent" of one of the leading provincial papers was surprised by the receipt of a letter from an important member of the Ministry, inviting him to call upon him at the office of which the writer was the new chief. "Mr. ———," said the Minister when the correspondent had been ushered into the handsome room looking out upon St. James's Park, where the affairs of one of the great departments of the State were administered, "I have sent for you to ask you a favour. You have no doubt seen that nearly all the London newspapers are attacking me for the changes I am introducing into this office. I have ascertained that many of these attacks are being made by clerks in this department. What I want to know is whether you will be willing to set my side of the case unofficially before the public. I don't ask you to praise me or to defend me, but simply, through your correspondence with the paper you represent, to let the facts about this office become known to the outside world. If you consent, I'll supply you with all the information you require, only making it a condition that you exaggerate nothing, and that you publish nothing which I wish you for the interests of the country to withhold from your readers."

Thenceforth, Mr. Reid assures us, the gentleman in question became the medium of communication between a great department of State and the public at large, and the attacks of the permanent officials were successfully rebutted. And he adds that within a very few years there was not a department in the State that did not make use of the press for the purpose of replying to attacks which could not be conveniently met in the House of Commons; and the whips of both parties, as well as individual members of every rank, recognized the great advantage of this means of establishing direct communication with the outer world. The London daily journals, as well as the Central News Association, have found it necessary to follow the example of their provincial contemporaries in adopting a regular system of "lobbying." And thus finally "the London Correspondent has become a person of exceptional influence and importance," and our legislators are not only willing but anxious to expose to his eyes the mysteries from which twenty years ago he was jealously excluded. Nay, more, the legislators themselves descend into the arena, for "it is notorious that some of the best London Letters published in the provincial newspapers are written by politicians who have made no mean reputation for themselves in Parliament." Mr. Reid declines to discuss at the fag end of his article how far this change is an unalloyed advantage, nor have we space to enter into that question here. He intimates pretty clearly however his opinion that the benefits of the change greatly preponderate, inasmuch as it tends to bring the governing body into closer and more direct relations with the people, and to make "the real working of the great legislative machine" better understood by the public out of doors. "We have to educate our masters in something more than the three R's." Be it so; but there is surely another side of the question, though it is too wide a one to examine here. The necessary tendency of this "new order of things" is not only to familiarize the people with the workings of Ministerial and Parliamentary business, but also to bring popular influence far more directly to bear on Ministers and Parliaments, and to give large additional power to "the fourth estate of the realm." That is certainly a very important, and perhaps an inevitable, but it does not therefore follow that it is a beneficial change. Mr. Reid appears to us throughout his paper either to overlook or to ignore it.

WRECK REPORT OF THE BOARD OF TRADE.

THIS Report which has been lately issued is not on the whole encouraging. From the abstract which it gives of the returns made to the Board of the casualties which occurred between July 1st, 1878, and June 30th, 1879, it appears that the total losses during that period exceeded those of the two preceding years. The vessels lost are spoken of in the report as "classed" and "unclassed"; the first heading comprising those which were classed at Lloyd's, the Liverpool Registry, and the Bureau Veritas; the second, those which were either classed at one of the smaller registries, or not classed at all. In 1876-77, the total tonnage of vessels belonging to the first category which were lost was 167,491. In 1877-78 it was 148,957; in 1878-79, 189,903. The increase, it will be observed, is very large. With unclassed vessels the case is different, as the number of accidents has happily diminished. In 1876-77, the tonnage of those lost was 123,999; in 1877-78, 120,077; in 1877-79, 108,546. The decrease is certainly satisfactory; but it must not be forgotten that the classed vessels are very much more valuable than the unclassed ones, and that the diminution of accidents to the latter does not, so far as regards loss of property, at all counterbalance the increase of accidents to the former. The totals are:—for 1876-77, 291,490; for the succeeding year, 269,034; and for 1878-79, 298,449. These figures tell a very painful story, and unfortunately they are not the only disagreeable ones in the Report. This contains, according to custom, a statement of the casualties to British vessels abroad, and to foreign vessels on the coasts of British possessions, and gives the annual average, as shown by the accidents which have occurred during a period of five years. It appears that the average number of casualties, other than collisions, causing total loss, is 688⅕. In 1878-79 there were 710 of these losses. The average number of collisions causing total loss is 30⅗. In 1878-79 the number was 39. The average of casualties of all kinds—with the exception of collisions not causing total loss, the records of which are deficient—is 3,090⅘. The number for 1878-9 was 3,198. Certainly the Report does not show that there has been of late any improvement in shipbuilding, or that sailors are becoming more skilful. It must not be supposed, however, that all the facts set forth in the official publication are of this unpleasant nature. There appears to have been, on the whole, considerably more than the usual amount

of misfortune at sea during the year mentioned; but nevertheless some of the returns are decidedly satisfactory. The casualties, other than collisions, to British vessels on the coasts of the United Kingdom were less than in the two preceding years. The losses were 274, as against 294 and 315; and the serious casualties not causing loss, 517, as against 587 and 726. The return of collisions on the coast, which includes those that occurred to foreign vessels, also shows a diminution, being 701, against 795 and 847; and the number of collisions involving total loss is below the average of ten years. This average number is $69\frac{8}{10}$. In 1878-79 the losses from collisions were 64. The casualties, other than collisions, involving total loss of British and foreign ships were also below the average of ten years, which is $410\frac{3}{10}$. In 1878-79 the number of these casualties was 333, the smallest, with one exception, of the whole period. Most important of all, there has been a diminution in the loss of life. In 1876-77, 3,051 lives were lost at sea; in 1877-78, 2,452; in 1878-79, 2,064. It should, however, be remembered that, in the second of these years the list was largely swelled by the loss of the *Eurydice*, and that, had it not been for this great misfortune, the number of deaths in 1877-78 would only have been slightly in excess of what it was in 1878-79. There can now unfortunately be no doubt that the return for the present year will be swollen by a calamity similar to that which occurred in 1878, and that the Board of Trade statement will have to include the loss of 320 lives by the foundering of the *Atalanta*.

In the tables giving the number of deaths from wrecks and other casualties some facts are shown which are well worthy of consideration. The comparative immunity from danger on board large ships is made evident in a very striking manner. In 1878-79 one casualty, causing the loss of two lives, occurred to a classed vessel over two thousand tons. In 1877-78 there had been no such accidents, and in 1876-77 there had only been the loss of one life. A similar proof of the safety of big ships is afforded in the tables, which give, irrespectively of loss of life, a classification according to size of the British ships lost on the coast. From this it appears that during the three years which have been mentioned there have only been thirteen serious casualties to vessels over 1,500 tons, and that only two of such ships have been lost. The largest number of accidents on the coast occur, it seems, to vessels of between 50 and 100 tons, but it must be remembered that most coasters probably come into this category. Of casualties on the coast or abroad causing loss of life, the largest number has occurred to vessels between 500 and 1,000 tons, but this apparently disproportionate amount of accident is to some extent accounted for when the huge number of vessels belonging to this class is remembered.

Some other facts of much interest can be gathered from the elaborate tables of this Report. The superiority of iron vessels is shown in the return giving the build of the ships which were lost on or near the coast during the twelve months. Only 4 iron vessels are returned as having foundered, against 45 wooden ones. Amongst the latter were probably a considerable number of small craft weak in construction and poorly manned, but, even when this is allowed for, the disparity seems great. Another fact well worth attention is shown in the tables relating to collisions on the coast. From them it appears that during 1878-79 collisions between sailing vessels and steamers caused more loss than collisions of the other two kinds, no less than 39 complete losses out of a total of 64 caused by collisions having been due to mishaps of this sort. To what is this large amount of serious accident due? Owners of steamships would say that it was caused by the misconduct of the captains of sailing ships, and by their reliance on the rule of the road as protecting them under all circumstances. Owners of sailing ships would attribute these mishaps to the recklessness of the captains of steamers, and probably would have better grounds for their statement than the others. In any case the fault must be held to be with those who have to administer the law, for there can be no doubt that, if the rule of the road were strictly and consistently enforced, transgressors would be few, since no class of men would continue long to violate an ordinance the breach of which was invariably followed by severe punishment. As it is, it can only be said that the facts set forth in the return are decidedly unsatisfactory. As a set-off, however, against the unpleasant impression made by the return which states them may be mentioned another, which shows how much has been done by a competent administrative department to diminish the dangers of navigation in the British seas. Out of a total of 2,013 casualties to British ships on the coast during 1878-79 only 7 are attributed to the want of lights or buoys. In the two preceding years the number had been yet smaller; and it seems clear that the enormously difficult work of lighting our coast and properly buoying all shoals is at last well-nigh concluded.

Of a variety of other matter of considerable interest which the Report contains want of space prevents us from speaking. On the whole, the impression which the most important of the many facts recorded in it give is, as we have said, unsatisfactory. The comparison of them with those of previous years certainly seems to show that casualties are not decreasing, that in spite of all that science and civilization have done, the dangers of the sea are not diminishing. Lamentable, however, as this necessary conclusion appears, it is not so surprising as it at first sight seems, when attention is given to the facts which from time to time come to light respecting shipbuilding. The most astonishing carelessness still prevails, and in the construction of large and expensive ships the elementary principles of naval architecture are more or less disregarded. Such at least is the inference to be drawn from the statements made by the Wreck Commissioner in a judgment which has been recently published. "The practice seems to be," said Mr. Rothery, "for the owner," who may be "previously totally unacquainted with ships or shipping matters, to give the builder certain dimensions, according to which he requires the vessel to be built. The builder takes the dimensions, and builds the ship without considering whether the dimensions are in due and proper proportions, or whether the ship when built will be a stable ship, and capable of carrying the cargo which could be put into her." After quoting the evidence of some of the witnesses in the case before him, Mr. Rothery went on to say:—"That gentlemen should invest money to the extent of some 30,000*l*. or 40,000*l*. in a vessel, and send her to all parts of the world, without having previously ascertained whether she is capable of carrying the cargo which they put in her, is to us utterly inconceivable, when at the very small expense, Mr. Merrifield tells me, not more than 20*l*. to 25*l*., they could have calculations made which would show them to what depth they could safely load the vessel. I do think that there is great room for improvement in this respect." There is too much reason to fear that this case is not by any means exceptional, but that a large number of vessels are built and sent to sea every year with a like recklessness on the part of their constructors and owners. While such incredible carelessness and indifference to all but immediate gain prevails, it is hopeless to expect that the list of grave accidents at sea will become smaller. Whether legislation can mend matters may well be doubted. It would be very hard to frame a law which could not be evaded, and Government surveyors cannot do the work of shipbuilders and shipowners throughout the kingdom. All that can be hoped is that in course of time enlightened self-interest may produce the necessary result. It cannot pay to build ships which, owing to the neglect of inexpensive precautions, are unsafe. Mr. Rothery's statement shows that there is at present not only disregard for life, but also disregard for sound principles of business.

COUNTRY HOUSES AND FRESH AIR.

THOSE that go down to the Thames in search of furnished houses will do well to lay to heart the case of "Kelson *v.* Queensberry." If they are particular about drains and keen in the detection of bad smells, let them before all things beware of agreeing to take a house in the condition in which it is at the time of letting. Without such an agreement the law is merciful. It holds that a house let for habitation should, as a rule, be habitable. But where the tenant has gone out of his way to specify the actual condition of the house as the condition in which he is prepared to take it, the law (*per* Coleridge, C.J.) holds that what the tenant has said, that he must be supposed to mean. It is no matter that he imagined the condition of the house at the moment when he signed the agreement to be a habitable condition. He had no business to assume anything of the kind. The condition of a house at a given moment is the condition in which that house is, not the condition in which some one who has never lived in it supposes it to be. The bargain in this case was express, and as such was not to be set aside by any number of implied contracts, however reasonable they may be in themselves. If Lady Queensberry had employed a surveyor to examine the house on her behalf, she might have been warned in time; but she accepted the lessor's assurance that the drains were all right, and signed the agreement containing the compromising words on which Lord Coleridge laid so much stress. Yet a little suspicion on this matter of drains might have been allowable when negotiating about a house which dated in part from the fourteenth century, and was provided with cesspools which, if not of this venerable antiquity, were probably as old as any cesspools known. One of these cesspools—a disused one—was exactly under the house; so that the family were separated from the ill savour of centuries by nothing but a concrete floor which had been substituted for an earthen floor in the year 1877. The cesspools actually in use were outside the house; but one of them, which communicated with the scullery, was filled with the overflow of an open cesspit covered with a grating. Considering the singularly sickening character of the odours from a scullery drain, this simple arrangement would go some way to account for the annoyances experienced by the inmates. These annoyances were of a decidedly unusual character. Lady Queensberry declared that she had smelt three distinct smells in her bedroom, which seems to argue either extraordinary gifts of nasal discrimination, or an extraordinarily varied accumulation of matter on which to exercise them, or perhaps both. The most striking testimony was that borne by Lady Florence Dixie. This witness had happily been in Patagonia, and in the course of her travels there had come across a dead Indian. Apparently a dead Indian is a remarkably ill-smelling object, for Lady Florence Dixie evidently thought that after this comparison no more remained to be said. Possibly a dead Englishman may in some far-away century have found his way into the closed cesspool underneath the house. The most singular part of the case is the patience which Lady Queensberry and her family displayed under these trials. The plaintiff seems to have behaved properly enough; for after Lady Queensberry's first complaint to him, he offered to cancel the agreement. Lady Queensberry declined this, and continued to live in the house for three months longer. As

late as July she asked an old servant to come down for the benefit of her health, which looks as though she had for a time forgotten the smells. Even Lady Florence Dixie, who had imported the parallel instance of the dead Indian, does not seem to have thought that the odour of the dead was of necessity injurious to the living, for when she went away herself she left her children behind her. It seems a singular house to be chosen, either as a sanatarium or as a nursery, and the fact that it had been picked out to serve both purposes in turn is *primâ facie* evidence that things were not quite as bad as Lady Queensberry ultimately came to regard them. Lord Coleridge told the jury that the point they had to decide was whether the thing delivered by Mr. Kelson to Lady Queensberry was substantially the thing which Lady Queensberry had contracted to take, and to this question they could not well have returned a different answer from that which they gave. The house at Marlow may have had many sanitary defects; houses, parts of which are five hundred years old, usually have. But there is nothing to show that Lady Queensberry inquired into the existence of such sanitary defects, or that Mr. Kelson knew anything about them, or had any thought of concealing them. The house was let as it was, and hired as it was; and even when Mr. Kelson offered to let Lady Queensberry off her bargain, she chose to hold by it. It took a quarter's acquaintance with the dead Patagonian to convince her that his neighbourhood was intolerable.

There are two lessons which make this case profitable reading for a large number of persons at this season of the year. One is not to agree to take a house in the condition in which it is, unless they have satisfied themselves that this is a condition in which they would like it to be. If they do enter into such a contract, there is no escape from it, and they had better not add the irritation and expense of a lawsuit to the annoyance already incurred. Lady Queensberry had made no stipulation against the presence of a dead Patagonian in the house, and as he was there and made part of the actual condition of the house when she took it, she was not allowed to raise objections to him founded upon longer and nearer acquaintance. Unfortunately, when people take furnished houses for short periods, they seldom think of their sanitary condition. Either they assume that, as the owner has himself been living in the house, there can be no very unsavoury smells in it, or they think that any slight inconvenience that may arise from this source will not matter for a short stay. It constantly happens that both these assumptions turn out to be unfounded. Either the owner has that singularly obdurate nose which the owners of ill-smelling houses not unfrequently have, or he is himself anxious to be released for a time from odours which even long custom has not made pleasant. It may not seem a very serious matter to have to live for a few months in a house which those who wish to make the best of things call "stuffy," while those who think more of truth than of politeness give it a stronger name. But a smell which is quite bearable so long as it is only a contingent product of the imagination may easily become intolerable when it is experienced as an actual fact. Alarm at possible consequences to health comes to strengthen the tenant's emotion, and in the end he probably leaves the house before his time is up, and prefers to pay double rent rather than one rent and one doctor's bill. It seems a hard saying to tell such a tenant that he ought to have had the house properly surveyed before he hired it; but, hard as it is, it is the only advice that it is of any use to give him. In fact, the shorter the term for which a house is taken, the more particular it behoves a tenant to be about its sanitary condition. If he has it for a good number of years, it is worth his while to lay out some money on it; but when he has it only for a few months, it becomes equally costly to throw up the house and to make it habitable.

The other lesson is that delightful old houses in delightful situations are not necessarily healthy. There was a period in sanitary history when, in order that things should be out of mind, it was sufficient that they should be out of sight. It was essential that there should be cesspools, but there was no reason why they should not be placed exactly under the living rooms of the house. It is sometimes assumed that the danger of bad drainage only exists in towns or villages, and that a house standing in its own grounds is necessarily immaculate in this respect. No assumption can be more unfounded. The danger is precisely the same whether a house stands by itself or is one of a group. It may have no neighbours within ten miles, and yet enjoy all the latest developments in the way of sanitary mischief. Its cesspools may be under the house, and no proper provision have been made for either cleansing or ventilating them. They may be constructed so as to retain their contents, in which case they will always be present to the noses of the inmates, and be inhaled by them at every breath; or the contents may be allowed to drain away into the surrounding soil, in which case the dangers arising from polluted water will be added to those arising from foul air. The best caution that can be given to the intending tenant of a country house is to suspect everything. Unless he can account for every yard of ground underneath his house, there may be some disused and unsuspected cesspool which is the real source of the nuisance which he is vainly trying to abate by improvements in the cesspools of the existence of which he is aware. When he has searched diligently, and succeeded in disproving the existence of any possible cesspool beyond those which he knows of, then—and not till then—he may call his friends and his neighbours together to rejoice with him over the house that he has found.

THE AMSTERDAM LOAN EXHIBITION.

THE Artists' Club at Amsterdam, known generally as the "Arti et Amicitiæ" Club, from the words inscribed over its house on the Rokin in that city, has lately opened a most interesting exhibition of works of art in the precious metals of the seventeenth and earlier centuries. A Committee was formed of members of the Club, with Mr. Philippeau as its President and Dr. J. P. Six as its Vice-President, to invite the loan of specimens of the handiwork of the old goldsmiths and silversmiths of the Netherlands, not only from private persons, but from municipalities and other corporate bodies, secular or religious. The result of their labours is a most novel and valuable collection, which ought to attract many visitors to Amsterdam, both artists and antiquaries. The exhibition will be open, we understand, till the middle of July. It is to be hoped that a French edition of the catalogue will be prepared before long. At present the only catalogue is in Dutch, and those who are able to read Dutch fluently are but few. Fortunately the works exhibited appeal to the eye of the connoisseur, and generally tell their own story.

The collection, which is displayed in the somewhat confined exhibition rooms of the Club, is not very well arranged. It is not always easy to distinguish the articles on loan from the very similar works of art belonging to the permanent collection of the Club itself. And the numbering of the specimens, at least in these early days of the exhibition, is not successfully managed. The catalogue itself, however, is well classified, and gives a great amount of information. What, perhaps, will first strike the visitor is the fact that the great majority of objects displayed are drinking-vessels of some form or other; indeed the catalogue, so far as it is completed, groups nearly the whole exhibition under the heads of different kinds of flagons or cups. Again, the rarity of ecclesiastical ornaments or utensils in this collection will surprise any observer who is accustomed to the predominance of such articles in any similar exhibition in any other country than Holland. There is not even a special heading for communion cups, and an *avondsmaalsbekertje* (such is the concise Dutch expression for a chalice) contributed by the Evangelical Lutheran Consistory of Weesp, and a like one from Alkmaar, are boldly reckoned among the "beakers." We suppose the Reformation, which so completely eviscerated the churches of the Netherlands, was fatal to all movable church ornaments. But we should think, judging from this Exhibition, that no country can show more gorgeous ancient plate than Holland can produce from its municipalities and guilds. Certainly the London Companies, or our old Universities, are less rich in proportion. Amsterdam itself, Rotterdam, Haarlem, Utrecht, Zutphen, Nijmegen, Arnhem, Bois le Duc, Kampen, and Zwolle (both names associated with the beloved memory of the author of the *De Imitatione Christi*), as well as many other towns, are represented in this Loan Collection, besides in addition many Guilds or Companies within them. Messrs. Six, Van West, Becker, Fuld, and Cuypers may be mentioned among the private contributors.

We wish we could give any intelligible description of some of the choice treasures of ancient art here for the first time collected together. But no words can adequately picture to the eye the beauty and fancy and variety of really first-class specimens of the goldsmith's art. Neither indeed can even photography give more than the outward form of such works. The colours of enamelling and the delicate manipulation and tool-marks of first-rate chasing must be seen to be properly appreciated. But we may mention a few of the more remarkable objects here exhibited. Among these must certainly be reckoned the drinking-cup in silver, parcel gilt, presented to the town of Kampen by Johan van Urck in 1551. It is adorned with three engraved medallions of Tamar, Nero, and Esther (a most inexplicable combination), and is a marvel of bold design in the reliefs and figures—women, animals, minstrels, and the like—with which it bristles. It bears this legend:—"Qui bibis hunc cyathum cui. sunt munera quæris + Largus Johannes Urckius ista dedit." Not less remarkable is the silver drinking-horn of the Guild of Foot-Archers of St. Joris of Amsterdam. This again is embossed with reliefs and medallions in the boldest style of the Renaissance. Its date is given as 1566. Another magnificent work is the copper-gilt enamelled drinking-vessel belonging to the Hoogheemraadschap (the High Board of Dyke Administration) of Rynland at Leiden, wrought in 1687, contrasting well with the more graceful "beaker" (that is, standing flagon) which was wrought for the Bakers' and Millers' Guild at Geppingen in 1684. Both these specimens are crowded with arms, names, and inscriptions. Inscriptions, indeed, generally in Dutch, abound on all these works, and are of considerable historical and genealogical value. They are not often very well chosen, and are sometimes, it must be owned, prosaic in the extreme. We noticed one silver cup, belonging to the Dyke-Administrators of Zeeburg and Diemerdijk, that bears the appropriate epitaph, "Adversus mare luctor."

A separate class is devoted to what the catalogue calls *Stortebekers* (spilling-goblets) and *Molenbekers* (mill-goblets). These are what we should call "heel-taps." They are cups which are suspended on frames, and cannot stand on their own bases. Usually they are in the shape of old women in the costume of the sixteenth century; or else of revolving windmills, or (as in one example) of a Turkish warrior, or else of birds balanced and poised. All these are in private hands. Several are contributed by Dr. Six, a descendant of the Burgomaster Six immortalized in

the magnificent portrait by Rubens belonging to Sir Richard Wallace. Dr. Six, who is a distinguished antiquary, most courteously admits visitors into his house on the Heerengracht, which is full of priceless treasures of Flemish art.

Another group of specimens contains ostrich eggs and cocoa-nut-shells in metal settings; and there is a subdivision of what are called Nautilus Bekers. Then we come to horns—of the eland, the buffalo, and other animals—in metal settings, of inconceivable richness, variety, and elaboration. The most remarkable is also the oldest in date. It belonged to the Rhijnschippers' Guild of St. Anne of Kampen, and is dated 1369. The ornaments are groups of St. Anne with the Blessed Virgin and Holy Child, St. Paul, and a magnificent ship in full sail. Most of these belonged to trade or art guilds. Some of them are historical annals in themselves. Thus the silver-mounted horn of the Shippers' Guild of Nijmegen has appended to it by chains no less than ninety-one shields, bearing the names, with arms or monograms, of all the masters of the Company from 1646 to 1810. All who know Van der Helst's *chef-d'œuvre* at Amsterdam, the "Banquet of the Archers," will remember how prominent an object one of these drinking-horns is made in the hands of one of the figures. The next division contains Drinkschalen—that is, drinking-shells, or open bowls. One of these, silver-gilt, was given by the city of Antwerp, in 1581, to John Godin. The inscription is as follows:—"S. P. Q. A. Joanni Godino ob egregiam operam in sopiendis dissidiis quæ religionis ergo ingruebant gratitud. monument." A pair of these bowls, of sixteenth-century work, were marriage gifts, and may be compared (though not perhaps to their advantage) with the well-known marriage dishes or bowls, *bacili* and *bacinetti*, of the famous potters of Gubbio. They exhibit also—just as the Italian bowls do—a most strange mixture of Christian and classical ornaments. For example, the devices on a pair of these bowls are groups of Juno, Venus, and Minerva, and Venus, Ceres, and Bacchus, with representations of the miraculous feeding of the five thousand and the miracle at the marriage of Cana. The same mixture is found in the couplet which explains the latter scene:—"Connubii ad festum Christus cum matre vocatus E lympha promit genialis dona Lyæi." We pass on to the section headed Drinkkroezen, -koppen en -kannen. These are pitchers, cups, and cans; but our English terminology of drinking-vessels is less scientifically accurate than the Dutch. Two of those are very ancient, being dated 1341, and both having belonged to the Archers-guild of Kampen. One (No. 163), of fifteenth century date, is ornamented with religious groups and inscriptions, one of which has not been accurately deciphered by the compilers of the catalogue. Had they been familiar with the famous Christmas carol "Quem vidistis pastores?" they would have known that the words which they give as "dicit (ur?) annua pat(e)r" are really "dicite, annunciate." Here is a somewhat ghastly inscription from a bowl of 1669:—

> Die dese beecker gaf
> Leeft eeuwig by sijn Godt,
> Wyl 't lichaam in het graf
> Tot zwol vast legt en rot.

Perhaps the most sumptuous specimen in the whole exhibition is a kind of flagon of sixteenth-century work, lent by the Grand-Duke of Mecklenburg-Schwerin, one of the few contributors to this collection who live out of Holland. It is made up of three magnificent enamels, held together by rich metal-work. The enamels, which are superbly coloured, and not over-modest in design, represent three Old Testament heroines, Jael, Judith, and the woman who "all to brake the skull" of Abimelech. The catalogue erroneously puts Deborah in place of the woman of Thebez. The last specimen which we shall notice is a most remarkable rose-water dish and ewer of seventeenth-century date, of boldest Renaissance design, with subjects from Pagan mythology. It is exhibited by the Guardians of the Popta Hospital at Marssum. In addition to the catalogued specimens there are countless metal badges, collars, crowns, circlets, insignia, and staves of office, civil and military; quaint owls and conventionalized birds for the table; keys, spoons, candlesticks, watches, snuff-boxes, and fans; book-covers (chiefly ecclesiastical), with metal reliefs, and costly jewelry; ivories in precious mountings, some metal statuettes in the round, and any number of swords, lances, and other weapons. The ecclesiastical works are, as we said, few in number, and not very remarkable. There are one or two silver-gilt Renaissance shrines, a processional cross in coarse *repoussé* work, and two or three monstrances, thuribles, pectoral crosses, and candlesticks. The specimens are almost exclusively of Low Countries workmanship, and are more remarkable for boldness, vigour, and exuberance of fancy than for delicacy or refinement. But the exhibition is exceedingly worth seeing by all who value archæology or art.

In conclusion, we notice that some attempt has been made to supplement the exhibition by a collection of old tools used in metal-chasing, engravings of other famous works of the same kind, and portraits of eminent metallurgical artists, together with some original broadsides, advertisements, &c., of some of the latter. No Dutch artist is likely to become as famous in the annals of art as Benvenuto Cellini. But the names of Van Miereveld, of Adam and Paul and John van Vianen, of Mayr, of Theodore Rogiers of Antwerp, of Quintinus a fossa, and Lutma of Oudely, ought to take their place amongst the roll of distinguished artists. Only a few of the works here exhibited can be accredited to their authors; notably one or two to Paul van Vianen, of Utrecht. One specimen is inscribed, "J. Pietersen inventor, H. Middelhuygen fecit." We may be permitted to commend to the Artists' Club of Amsterdam the expediency of keeping open this unique exhibition till the close of the autumn. Many English visitors might wish to see it who could not easily leave home before the Long Vacation.

THE TRADE OF APRIL.

THE Board of Trade returns issued at the close of last week are the most satisfactory that have appeared since the commercial revival began at the end of the summer, and they are more especially satisfactory because of the complaints of renewed depression which have been rife of late. Of course it is possible that the large increase of the exports which, as we shall presently see, took place last month, may have been due to orders given in the autumn and winter, and only executed in April, and that when those orders have all been completed, a great decrease may manifest itself. To some extent we are prepared to find that this will be the case. The fall in prices on which we commented a couple of weeks ago proves that business is not now as active as it was a little while ago. Nor can it be doubted that some of the orders given while the speculative fit was hot have been cancelled, those who gave them paying forfeit for the privilege. But, as we pointed out when considering the fall of prices, there is nothing to show that the causes which produced the revival have spent their force; on the contrary, there is much to lead to the opinion that the check is merely temporary. Without, however, dwelling further on these considerations, let us pass on to the examination of the Board of Trade figures; and in the first place let us turn our attention to the exports, which declined so greatly during the long depression as to quicken once more into activity the old protectionist craze.

The exports of British and Irish produce last month were of the value of 19,623,360*l.* against 14,642,358*l.* in April of last year; an increase in round numbers of almost 5 millions sterling, or just 34 per cent. For the first four months of the year the increase was only 14,170,000*l.*, or less than 25 per cent.; so that, while for the four months since the end of December the exports in comparison with the same period of last year have not increased quite one-fourth, in April alone they have increased more than one-third. In other words, our foreign customers have gone on doing with us a better business as time passed on. But, as we remarked above, new orders are not now as numerous as they were some time ago. Part of the increase in last month's exports is due to the rise of prices witnessed since the spring of last year, and part to an augmentation of quantities; but without such an analysis as was made by Mr. Giffen when he undertook to show that the decline of exports which was creating apprehensions for our commercial future was chiefly a shrinkage of prices, it would be impossible to attribute to each its share in the increase, for the reason that in many cases the quantities are not given. As regards the commodities exported in larger quantity or value, they are so numerous as to afford reasonable ground for believing that the revival is no temporary spurt, but a real and general improvement. Amongst them we find woollen manufactures of all kinds, woollen yarns, and wools, silk manufactures, tin, telegraph wires, paper, seed oil, machinery and mill-work, linen manufactures, lead, iron and steel, haberdashery, glass, cotton manufactures, and chemicals. We have given this list without any attempt at classification, without even an indication by the order of enumeration of the relative importance of the commodities mentioned, our object being solely to show that the improvement is not confined to this or that leading item, but is so general as to render it highly improbable that it can be passing or accidental. If we confine our attention to the most important articles, we find the returns equally satisfactory. Thus the total of iron and steel of all kinds, manufactured and unmanufactured, exported last month, amounted to 455,191 tons, against 227,989 tons in April of last year, being an increase in quantity of 227,202 tons, or, as nearly as possible, 100 per cent. In value the increase was from 1,481,466*l.* to 3,203,378*l.*, being 1,721,912*l.*, or over 116 per cent. The increase here is greater in value than in quantity, though not nearly so much as might have been expected from the great rise of price during the twelvemonth. But it is to be borne in mind that old iron bears a much larger proportion to the total last month than it did twelve months ago; being 40,415 tons last month, against 4,451 tons a year before; in other words, while the total export of iron and steel was barely doubled, the old iron exported was multiplied nine times. Yet, even when we make allowance for this circumstance, it is evident that the orders executed last month were placed very favourably for those who gave them. Thus, for example, the quantity of railroad iron of all sorts exported increased 108 per cent. and its value only 146 per cent. We have thus confirmation of the opinion that last month's exports were but the execution of orders long since given.

As regards the countries to which the increased exports of iron and steel went, the United States stand first, but British North America, India, and Australia likewise purchased much more largely than before. In cotton manufactures, again, of which the quantity is given, there is an increase in yards of 23

per cent., and in value of 35 per cent. It would seem, however, that the rise of prices is really much greater than this. As our readers are aware, there is a dispute in Blackburn between the manufacturers and the weavers as to wages, and the operatives have not been slow to point to the increase of exports last month in support of their case, urging that, if an increase of wages can be given to the spinners though there is a falling-off in the export of yarn, *à fortiori* may the concession be made to them. But it is replied that the increase is in light goods, and in length only, in weight there being a decrease. If this be so, it is evident that the rise of price is very considerably more than it appears from the Board of Trade returns. With this illustration before us of the impossibility of determining how much of the increase even in a particular commodity is due to improvement in prices without knowing the difference in quality of the exports we compare, we may perhaps be excused from carrying further the analysis we have made in the case of iron and cotton. Broadly, we may state that there has been an augmentation both in quantities and values, and for our present purpose that is enough. In cotton piece goods the increased exports were to British India, the Straits Settlements, Turkey, Egypt, Brazil, Chili, British America, Japan, and the Philippine Islands. In woollens they were to the United States, British America, India, China, and South America. It will be seen from these lists that the enhanced demand does not come from the United States alone, any more than it is confined to a particular class of goods, though the purchases of that country first gave the impetus towards revival, and still are most important of any. It will further be noticed that the cessation of famine in India and China has instantly made itself felt, more especially in the new life it has imparted to the cotton industry. In the four months of the current year there have been imported into Bombay alone about 71¾ million yards of cotton piece goods more than in the corresponding period of last year; into Madras about 6 million yards more; into Bengal about 66 million yards more. We have in these figures evidence of the correctness of what has often been urged in these columns—namely, that the long depression which caused so much alarm was really due to the temporary failure of the purchasing power of our chief customers, rather than to any fault of our own, and that, with the recovery of those purchasers, our industries would once more start into activity. This is what is actually happening.

Coming in the last place to the imports, we find in them also an increase of value of 6,876,000*l.*, or about twenty per cent. The increase is found in the raw materials of manufacture, as well as in articles of food—as, for example, in wool, wood, tallow, unrefined sugar, lead, jute, iron ore, hides, and cotton. But in these the rise in prices seems to play a greater part than the increase of quantities. Even raw materials vary considerably in quality, the produce of some countries being either intrinsically superior to that of others, or being sent to market in better condition; while in the same country crops vary with the seasons. Still quality does not count for so much in raw materials as in finished goods. Besides, there are cases, as, for instance, tanned hides, where with a decrease of quantity there is an increase of value. But it is in articles of food that the principal increase of the imports is found, constituting about 2½ millions out of the 6¾ millions of the total increase. In other words, while the total increase in the value of the imports amounts to 20 per cent., in articles of food it is as much as 30 per cent. In wheat alone the increase for the month exceeds 900,000*l.* From the beginning of the agricultural year—that is, from September 1 to the end of April—the total imports of wheat amounted to 9,280,292 quarters, being an increase of 1,977,726 quarters over the corresponding period of last year, or between a fifth and a fourth. Considering the badness of the last harvest, and the estimates of our requirements that were then current, this is a very moderate augmentation. With two-thirds of the agricultural year already over, our wheat imports but slightly exceed half the estimate put forward on good authority last autumn. Even if we include the wheat flour imported, the total but slightly exceeds 11,300,000 quarters. These figures illustrate anew the inevitableness of exaggeration in the presence of disaster, and the readiness with which consumption adapts itself to price. But to come back to last month's return; we find a small increase in the quantity of coffee imported, and also in that entered for home consumption, and a very large increase in both items in the case of cocoa, especially in the home consumption. In tea, on the contrary, there is a large decrease under both heads. In all these articles there have been very heavy losses, the speculative rise of prices having been excessive, and the consequent fall severe. It is, moreover, noteworthy that the imports of refined sugar fell off very considerably both for the month and the four months, while those of unrefined sugar decreased but slightly for the four months and actually increased for April. Our readers are aware of the complaints of our sugar refiners, insisted upon for years, that they are being ruined by the competition of bounty-fed sugar. An increased import of the raw material for refining, accompanied by a decrease of the bounty-fed refined article, certainly does not suggest ruin.

REVIEWS.

HISTORIES OF THE HUGUENOTS.*

THESE two works are like the beginning and ending of a great whole, the middle part of which is wanting. We may regard Mr. Poole's work as a kind of unintended sequel to Mr. Baird's, or may regard Mr. Baird's as an unintended introduction to Mr. Poole's; but in either case there is an evident gap between them, and the missing link is not the least important or least interesting portion of the great tragedy of French Protestantism. The American Professor includes within his two thick volumes a period of fifty years, closing with the death of Charles IX. in 1574. Throughout the main part of his first volume he runs side by side with Merle d'Aubigné, and there is no conspicuous difference in their religious point of view, though Mr. Baird has a firmer grip of the political aspects of the French reforming movement, and of its relation to the general history of Europe, than D'Aubigné had. His scene lies almost wholly in France, though he is of course obliged to travel to Geneva, since the extra-national throne of the successive pontiffs of French Protestantism, Calvin and Beza, was erected in that city. Mr. Poole begins with the Revocation of the Edict of Nantes, merely prefixing a summary account of the state of the Huguenots in their own land under the qualified and insecure toleration with which they had to content themselves prior to the Revocation. His scene lies principally out of France; he follows the Huguenot emigrants into England, Ireland, America, the Low Countries, Germany, Switzerland, and the various nations and cities in which the French fugitives found settlement. The reigns of Henry III., Henry IV., Louis XIII., and nearly fifty years of the reign of Louis XIV., lie unchronicled in the long interval between the two accounts. Hence the two books, when taken together, notwithstanding the conscientious ransacking of newly-opened materials and the scrupulous re-examination of the older materials which characterize both writers, give but an incomplete picture of the Huguenot drama. When Mr. Baird closes his work, we look upon French Protestantism as a mighty political force, identified with the hopeful cause of the Bourbons, and contending for domination in France. When Mr. Poole begins, the Bourbons have been triumphant for nearly a century, but their old ally, Protestantism, has sunk into a mere religious party; it has lost its original importance as a great political force. The decisive moments in the fate of French Protestantism are to be found in the omitted interval between Mr. Baird's subject and Mr. Poole's. It is of the first importance to remember that during this interval the French King had succeeded to the place which was held at its beginning by the Spanish King; he had become, so to speak, the real secular chieftain of Latin Christendom. What the Holy Roman Emperor was in theory, the "Most Christian Kings" of France became in fact, and they became so with the help of the Protestants. From the middle of the sixteenth century to the middle of the seventeenth, a whole succession of French monarchs and statesmen frowned upon native Protestantism, or during its breathing-time treated it but coldly, while they smiled upon foreign Protestantism. To put it down as a disintegrating force in France, and to encourage it for the same reason in Germany, was the policy alike of Francis I. and Henry II. and of Cardinal Richelieu. The measure of toleration which the Huguenots enjoyed under Richelieu and Mazarin was in great part due to the need of standing well with the Protestant princes and States, though both these great Ministers were too much of statesmen to be religious fanatics. The able writer of the "Interest of Princes and States" observed, a few years before the Revocation, that a great change had already occurred in French policy in 1680; no longer in any fear of Spain, the French had taken to "personating," as he puts it, "a great concern for Popery, that they may be no more thought, as formerly, Heretical Papists, but, on the contrary, the most zealous of that Church." The modified anti-Popery of the great Gallican clergy under Louis XIV. exhausted French Protestantism of what force it had as a protest against the extra-nationalism of the Vaticanist system; though indeed it must be added that French Protestantism was never so fundamentally national as French Catholicism, while during the period described by Mr. Baird it was little less Ultramontanist than French Romanism, its ultimate court of appeal sitting in Geneva instead of in Rome, and its fountain of pure doctrine flowing from the shores of Lake Leman instead of the banks of the Tiber. If Bossuet and his followers had been indeed Gallican Catholics rather than Gallican Papists, if they had not left a small Papal rift in the Gallican lute, the splendid intellectual and industrial forces madly expelled from France by the Revocation of the Edict of Nantes, and scattered abroad to enrich rival nations, must have been absorbed into the national Church. The noblest ecclesiastical traditions of France, maintained by Hincmar, by St. Louis, and by Chancellor Gerson, would have found a logical completion, and the subsequent history of the French people would have been less volcanic than it has been.

Mr. Baird's volumes include all the great determining moments

* *History of the Rise of the Huguenots.* By Henry M. [illegible] in the University of the City of New York. 2 vols. London: [illegible] Stoughton. 1880.

A History of the Huguenots of the Dispersion at the Recall of the Edict of Nantes. By Reginald Lane Poole. London: Macmillan & Co. 1880.

in the development of Huguenot history as far as the St. Bartholomew Massacre—the "Erasmian" epoch of the French reformatory epoch, when all that was best in French scholarship and piety inclined to the party of reform; the wavering attitude of Francis I., and his attempt to draw Melanchthon into France as a conciliator; the episode of the savage placards against the Mass, and the subsequent expiatory processions; Calvin's flight from France and settlement in Geneva; the political supremacy of the Guises; the colloquy of Poissy; and the Edict of January 1562, by which the Queen Mother, Catharine de Medici, gave proof that her political inclinations leaned towards the side of reform, as she had borne witness in the year before when she sent a defence of the Huguenots to Rome, declared that they were neither Anabaptists nor Libertines, that they held all the articles of the Apostles' Creed, that they ought not to be cut off from the communion of the Church, and that it would be advantageous to the Church if many of their demands were accepted, such as the removal of images, the abolition of a great part of the ritual, the administration of the Eucharist in both kinds, and the adoption of public worship in the vulgar tongue. Mr. Baird is so possessed by the conviction that nothing but that Presbyterian Protestantism which was afterwards definitively formulated, through a series of accidents, can have any logical title to admiration, that he everywhere shows himself as incapable as D'Aubigné was of doing justice to a sober *via media* party, to "Erasmians" and "Nicodemites." Bishop Briçonnet, Gerard Roussel, and even Faber Stapulensis, seem to be objects of his patronage and pity. He has not the heart or imagination to do justice to the earliest, most learned, and most attractive school of French reformers. He evidently prefers a very Hudibras to a Mr. Ready-to-Halt, though the preference is manifested rather in his manner of treatment than in actual statements. In his chapter on the early unCalvinist Reformation at Meaux under Bishop Briçonnet, which is compiled with conscientious study, and most pleasantly written, he flings a number of damnatory epithets and expressions at the representatives of the unpuritanical middle party. The occasional savagery and hot-headed intolerance of Farel are kept in the background; the entire plan which he had in view alone is dignified as "The Gospel." While Mr. Baird was composing his history and turning over the rich mass of materials which are now open to the student, he missed the deepest and most permanent lesson of the Huguenot tragedy by his tacit and uninquiring acceptation of the hypothesis that every Frenchman was obliged to be either a formal Papist or a formal Calvinist. Hence Bishop Briçonnet's natural hesitation to plunge forward headlong into the unknown and untried darkness whither the Hotspurs of the movement were wildly dashing is stigmatized by Mr. Baird as "pusillanimous defection." If he does not openly sneer at the great scholar Faber Stapulensis, and at the high-minded and eloquent Gerard Roussel, when they take refuge at Strasburg, by shouting after them "prudent reformers!" and by following them with cries of "cowardly souls," "paltry evasions," "timidity," and "excessive caution," he does his best to degrade them by contrasting them with the "fearless athlete," the young Farel. He might have remembered that the pious Bishop and the great Humanist had been life-long Gallicans and Reformers; while Farel, always in extremes, had been an ultra-Papist. He was at least as intolerant in his Protestantism as he had been in his Popery; no sooner had he arrived in Basel than he began to rail at the venerated Erasmus, who was then the guest of the city, as a "Balaam." The gentle Oekolampadius, the reformer of Basel, had to remind him that "men can only be led to the truth, they cannot be driven to it." That Mr. Baird knows how to apologize when he finds a wrong-doer whom he thinks deserving of a good word, is clear enough from his long note of three pages of special pleading on behalf of Queen Margaret of Navarre in her character as the author of the *Heptameron*. Mr. Baird's royal portraits are always lifelike; and, as the history of the Huguenots during the fifty years included in his volumes is the history of France, he has painted a whole series of kings, queens, and statesmen. The authorship of the *Heptameron* ought to have been placed to Margaret's credit, or discredit, when she is first introduced to the reader; it is too characteristic of that wonderful woman and her surroundings to be mentioned in an appendix, as if it were a purely accidental excrescence. It shows that the scholarly lady, who was at once a Catholic and a Protestant, and who saw no inconsistency in being both at the same time, was amusing herself with the unseemly gallantries of Boccaccio's *Decameron*, while she was sending out her colporteurs to sell jewelry and distribute New Testaments to the young girls of southern France.

Mr. Baird is far more at home in the political history of France and of contemporary Europe than our English religious historians usually are, or at least than they have been until late years. He is a faithful, if a somewhat partial, chronicler of all the main events which lie between the famous "Bath of Blood" at Vassy, with the consequent outbreak of the first civil war, and the St. Bartholomew Massacre, and he tells his story so well that it cannot fail to interest the reader. He might have added fresh light from the State archives of Zürich, Bern, and Basel, if he had consulted the late Dr. J. C. Mörikofer's *Geschichte der Evangelischen Flüchtlinge in der Schweiz*, a book which deserves an English translation. The Switzers, after their manner, fought in both camps during the French civil wars, and the Federation was courted by both parties. At the Tagsatsung at Solothurn, in April 1562, Coignet asked for three or four thousand men for the French King, while Condé and Chatillon urged the Evangelical cantons to oppose the demand. Bullinger not only stopped the Council of Graubünden from sending help to the Guises, but prevailed on Hercules of Salis and Ulrich Philip of Hohensax to take arms under Condé. On two critical occasions—on the road from Meaux to Paris, and at the battle of St. Denys—the bravery of Swiss mercenaries decided the victory in favour of the Catholics, and the French ambassador, Bellièvre, was directed to inform the Cantons of the fact. Ninety of the Evangelical Swiss warriors who had been enlisted to fight against their French co-religionists, and who deserted from the royal camp at Troyes, were cut down in mistake by the Huguenots. At the end of his chapter headed "The Year of the Placards," Mr. Baird indeed refers to "an appeal" from the city of Strasburg and the city of Zürich, and to "a formal embassy" from the cantons of Basel and Bern and the city of Strasburg, to Francis I. on behalf of his persecuted Protestant subjects. The championship of the French Huguenots, and of the Vaudois of Provence, by the four "Evangelische Städte," Zürich, Bern, Basel, and Schaffhausen, was not exceptional, but repeated and continuous for many years. Mr. Baird gives the reply of Francis to the Evangelical cities in 1537, though he does not cite the pithy report of the embassy which Bern communicated to her confederates:—"The King was much more gracious at the beginning of his speech than his written answer afterwards turned out to be. The ambassadors had done their best, and dealt faithfully, but received answer according to a Court's manner (*nach Hofs Art*)." Ten years later the Evangelical cantons were still begging the King to show some mercy to their persecuted co-religionists, and only a short time before his death Francis wrote to his "Très chers et grands amis" of Zürich, Bern, Basel, and Schaffhausen, expressing his anger at their repeated interference with his administration and government of his own subjects, which he carried on "comme un bon prince doit"; he said that he was astonished that they should give the name of cruelty to "la Pénition que nous faisons faire a ceux qui out commis plusieurs Rebellions et Désobéissances a l'encontre de nous"; he asserted that the rebels did not "follow the evangelical verity of which you say that they have made profession," but that "the Vaudois and other heretics whom we have caused to be punished hold such errors as no prince nor community in Germany would tolerate in their countries"; he ended by warning "his dear and great" Swiss allies that they must cease using "de tels si étranges termes comme Cruautés et Horribles Punitions, afin que nous n'ayons occasion de vous faire Rude Réponse." Here we see the key to the attitude of Francis. So long as he thought a mere scholastic quarrel was going on, he took side with the reformers as a patron of letters, but when he perceived the political tendency of the new movement he became its foe in his own kingdom. When we read "Le Conseil de Zurich," and "Le Conseil de Berne au Conseil de Bâle," as the sources of Mr. Baird's statements, although he urges us to "Cf. the documents, mostly inedited," we perceive that he is making use of some French writer, and not of the original German or Latin documents in the "Staatsarchive" of Bern, Zürich, or Basel. Mr. Baird is a severe critic of English historians who have gone astray in their references to his province of study; he hunts down and exposes Mr. Froude for his ill-chosen source of material for his description of the massacre at Vassy; he detects the chronological slips of his fellow-countrymen Mr. Motley and Mr. Prescott. Though his own *tendenz* as historian sets in the same direction as D'Aubigné's, he is keen enough to perceive that the latter too often plays the historical novelist rather than the historian, especially when he deals with his idolized hero, Calvin. Mr. Baird closes his picturesque and diffuse narrative in the same temper as a dramatic author closes a tragedy in which the hero of a cause ultimately defeated in actual history figures episodically as a conqueror. The curtain does not fall upon the St. Bartholomew Massacre, but upon the judicial death of Charles IX., and the spectator is asked to regard the Huguenots as having "survived four sanguinary wars into which they had been driven by their implacable enemies," as "just entering upon a fifth war under favourable circumstances," and as standing "before the world a well-defined body, that had outgrown the feebleness of infancy, and had proved itself entitled to consideration and respect." He thinks that "they had made it manifest that their success depended less upon the lives of leaders, of whom they might be robbed by the hand of the assassin, than upon a conviction of the righteousness of their cause." But "the hand of the assassin" struck at the leaders on both sides, and if the Bourbons owed much to the Huguenot enthusiasm, what did the Huguenots become when Bourbon leading failed them?

Mr. Poole's little book was originally a University essay, written in competition for the Marquess of Lothian's historical prize. Like Mr. Baird, Mörikofer, and all the recent French and German writers in the same province, he has made a very full use of the exceedingly rich volumes of the *Bulletin de la Société de l'Histoire du Protestantisme Français*. Apart from its genuine merits as a methodically planned and well-written contribution to "culture-history," Mr. Poole's work has no small bibliographical worth as a book of reference, for he has evidently made a conscientiously exhaustive study of the whole literature of his subject, English, French, German, Dutch, and Swiss. He scrupulously clenches every statement in his text with a verifying note; indeed his chief faults are the very pardonable ones of over-citation and over-illustration. He is usually broader, fresher, and less biassed in his judgments

than the American professor. We should hardly expect from Mr. Baird such a graceful and grateful homage to "the honoured name of Edward Bouverie Pusey" as Mr. Poole has rendered. He might have had a fresh glimpse of the emigration of the so-called "Palatines" in 1709 by looking at the interesting journal of the Quaker missionary, Thomas Chalkley, who sailed with a number of them from the Thames to the Delaware. In his remarks on the relation of the Huguenots to the Church of England, and to the Revolution of 1688, Mr. Poole contends that they "helped not a little to formulate the public opinion that offered the kingdom to William of Orange." He complains that this "fact" has been too commonly ignored by our historians, and cites as his witnesses three foreigners, all of whom are Frenchmen, and one of them is Michelet. He either ignores, rejects, or is unaware of the powerful letter which the Huguenot ministers in Germany addressed to their brethren in England, blaming them for their blind and weak compliance with the policy of James II., and urging them to follow the brave leading of the English episcopate. The Huguenots on the Continent saw through the King's Declaration of Indulgence, and accused their brethren in England of "contributing to re-establish Popery in their new country" by joining those Dissenters who had published the declaration or addressed the King to thank him for it. "Is this," they ask, "to answer the glorious quality of confessors, of which you so much vaunt yourselves? Could you see those faithful servants of God (the Seven Bishops), with a zeal worthy primitive bishops, disobey the order of their sovereign, suffer imprisonment, and prepare themselves to suffer anything rather than betray their consciences and their religion, without admiring their constancy and being touched by their example? How is it that the generous refusal of the Bishops, though at the peril of their liberty and estates, to publish the declaration in their dioceses should not at least have opened your eyes? Reflect a little on what we have here said, and you will confess that we have reason to commend the conduct of the Bishops who refused to publish the declaration, and to condemn those Dissenters who have made their addresses of thanks for it." This letter was printed in 1689.

MURRAY'S EGYPT.*

MR. MURRAY would seem to have at length realized the fact that his Handbooks have to compete with the rival publications of Baedeker, and that new editions are in some cases necessary unless he is to be thrust out of the market altogether. Were it not that there is as yet no English edition of Baedeker's Guide to Upper Egypt, we cannot conceive even the most patriotic Briton buying the unwieldy volume of antiquated theory and worthless information which has hitherto received the sanction of Mr. Murray's name, and we are glad to be able to draw attention to the very great improvements which have been effected in the present edition. A large part of the work has been entirely rewritten, many excellent maps and diagrams have been added, and not the least important alteration is the division of the work into two volumes, so that the tourist may now carry his Guide about with him, without having a huge pocket specially constructed to hold it.

It seems almost a truism to say that the merits of a guide-book must be considered with reference to the needs of ordinary travellers rather than of advanced students; but in writing a Guide to Egypt there is a strong temptation to overlook this fact. As the science of Egyptology is now only in its infancy, and the data before us are most incomplete, there exist very many possible theories on the art, history, and religion of ancient Egypt. Each new discovery of importance gives rise to new theories, and the few men who are qualified to speak with authority on the subject, even to the extent demanded by the superficial requirements of a guide-book, are for the most part pledged to one or another of these theories, if they are not absolutely the originators of them. There is every temptation to such men to use their opportunity as a means of spreading their own opinions, instead of giving the simple guidance necessary to a traveller of average ignorance. This danger the compilers of Murray have almost entirely escaped. The work is essentially popular in its character, and no special knowledge is necessary for the understanding of any part of it. We lay stress on this point because the same cannot be said of Baedeker. His descriptions of temples and courtyards are often rendered bewildering to readers who have little or no architectural knowledge, by the profusion of technical terms. Another point which renders Murray preferable for English travellers is the spelling of Egyptian names, both ancient and modern. The question of transliteration is of course a difficult one, and, from the point of view of scholars, it cannot at present be definitively settled. But in a guide-book the method suggested by common sense is to spell the names just as an educated member of the nation for whose use the book is intended would naturally spell them if he heard them pronounced by a native. For the first time, this method has been consistently followed in the present edition, and its adoption is all the more pleasing from the elaborate apparatus of mysterious symbols and the piling up of superfluous aspirates to be found in Baedeker. It will be agreed that "bakhshîsh" is a needlessly intricate way of spelling the word most commonly heard by travellers in Egypt; and English readers, at least, would not suspect that û was the equivalent of *oo*, or that a word written Zakâzîk was pronounced Zagazig. Again, Salâheddin may or may not be the scientifically correct method of spelling the name of Richard Cœur de Lion's celebrated adversary, but surely he would be more generally recognized as Saladin. The editor feels it necessary to make in the preface some apology for taking this liberty with modern Arabic words, but a large majority of his readers will be very grateful to him for having done so. Under this system the Arabic vocabulary has been made intelligible and useful. It is perhaps rather too copious, and contains words which the ordinary traveller will never require; but we cannot point out the omission of any useful words; and, unlike most Arabic and other vocabularies attached to guide-books, the words contained are such as are in common use, to the exclusion of those which belong purely to the classical or written language.

If we turn to the pages which describe the Museum at Boolak we shall find the same superiority over Baedeker. Those objects are selected for notice which, from their intrinsic beauty or from some special interest attaching to them, are likely to attract such visitors as have no intention of making a study of Eg[illegible]. The very few to whom Baedeker's exhaustive list could be of any value would be sure to purchase the excellent Catalogue, which is the work of M. Mariette and Herr Brugsch, while ordinary travellers would toil in vain through ten pages of microscopic print without receiving very much assistance in their search after the beautiful or the curious. In connexion with Boolak Museum we are glad to note an absence of the rather extravagant praises lately bestowed upon the statues of Rahotep and Nefert; while the wooden statue of a village sheik, which seems to us to be on the whole a better work of art, meets with due recognition. Passing from ancient Egyptian to Mohammedan remains, a word of praise must be given to the excellent account of the various mosques of Cairo, and the accurate plans of the more important among them. Here, as in the chapter on ancient art, the writer has not been content to give a description of each object of interest as it stands, but has added a brief sketch of the progress of Mohammedan architecture from the seventh century, when it was little more than a reproduction of Greek and Roman forms, as in the Mosque of Amer, to the fifteenth, when the style reached its most characteristic and graceful development in the mosque-tomb of Kaitbey.

The interesting Coptic churches are well described, and a special feature of the book is the notice given to the convents of St. Paul and St. Antony in the desert to the east of the Nile, and to those near the Natron lakes to the west. These convents are seldom visited, though they contain much that is of great interest to students of Christian antiquities, and, considering the large proportion of clergymen among the English travellers in Egypt, it is strange that they have not attracted more attention. However, it is the habit of tourists in every country to pay attention to what is generally considered most remarkable, regardless of their own ordinary tastes and studies, for the reason which induced Sheridan's son to go down a coal mine—not because he took any interest in mining, but to say that he had been; and no doubt the knowledge that a man has actually sat on the top of the Great Pyramid imparts an Oriental flavour to the details which he gathers from his guide-book for the benefit of his friends at home. A good history of the convents would no doubt make them fashionable among tourists, and would also be of great interest not merely to ecclesiastical students, but to general readers, for the monks must have experienced strange vicissitudes in the course of their history, and suffered much at the hands of their Mohammedan neighbours. Indeed the extreme precautions observed in admitting strangers seem to show that they do not feel themselves entirely safe, even at the present day.

It is comforting to find that the account of the quarries of Toora and Masarah has been rewritten. The description of the ancient method of quarrying given in previous editions was totally unintelligible; we have never met a single visitor to Egypt who was not puzzled rather than enlightened by it. The present account is simple enough, and the absence of any memorials of the early empire in these quarries is plausibly explained by the suggestion that the operations of this early period have been obliterated by subsequent excavations under the later dynasties. There is, however, no mention made of the probable reasons for the great length of the caverns cut into the hills, which seems to be that the rock near the surface is generally much softer than that found further in, and that the workmen tunnelled on until they reached stone hard enough for their purposes.

The descriptions quoted from various authors which are introduced here and there throughout the book are for the most part judiciously selected, and there is an almost entire absence of original fine writing. One advantage of this self-restraint is the avoidance of such ludicrous mistakes as one which occurs in Baedeker's description of sunset as seen from the heights above Cairo. Here we are told that "on the borders of the immeasurable desert tower the huge and wondrous old pyramids, gilded and reddened by the setting sun." As a matter of fact, the position of the pyramids is almost exactly between the spectator and the setting sun, and so far from being gilded and reddened, they stand out nearly black against a glowing background. On the whole there are singularly few mistakes to be found in the present work. We are inclined in one or two instances to dispute the advice given to tourists as to the choice of hotels. Many experienced travellers will, for example, prefer the Hotel Abbat at Alexandria to the one which is here recommended.

* *A Handbook for Travellers in Lower and Upper Egypt.* Sixth Edition. London: John Murray.

Nothing but unreasoning enthusiasm for all things Eastern could have led to the statement that the flesh of Egyptian sheep is good. Of course excellence in such matters is relative, and we fully admit that, as compared with Egyptian beef, Egyptian mutton is very desirable food; but, as compared with the flesh of any other animal that we remember to have ever eaten, it is tough and tasteless beyond expression, and requires all the resources of a good cook to make it either palatable or digestible. In the list of the various restaurants and provision shops of Cairo, the writer has forgotten to mention, what many thirsty Britons will be glad to know, that a glass of English draught beer is to be had at Ablett's in the Moosskee.

The photographs of Béchard (not Béchart) are strangely enough passed over without any share of the praise which is bestowed upon others of certainly no greater merit. It is true that some of his negatives are far too much manipulated; but, after making all due allowance for this defect, or rather excess, his views of the streets and neighbourhood of Cairo are, in our opinion, decidedly the best to be had. The only reference made to the beautiful red and black pottery of Assyoot is a casual remark that the best pipe-bowls in Egypt are made there, and yet this manufacture is one of the very few industries in Egypt which has any artistic merit still remaining. All travellers who go up the Nile should purchase specimens on the spot, as the somewhat similar ware to be bought in Cairo is utterly inferior in form, colour, design, and workmanship, as well as in the fineness of the paste. Perhaps the most astonishing statement in the whole book is that nailed boots are useful in the ascent of the pyramids. We shall next be told that skates are useful to prevent inexperienced persons from slipping on ice. In connexion with this part of the subject, the "panorama of the pyramids" must be excepted from the praise already given to the maps and diagrams generally. The angle at the apex of the pyramid is, in almost every case, much too acute; a somewhat false idea is conveyed of the curiously shaped pyramid at Dashoor; and the step pyramid of Sakkarah looks as if it were built of children's bricks. Such diagrams are quite useless unless they are perfectly accurate. No one needs a picture to give him a vague general idea of the shape of a pyramid. One more defect—not a very important one, perhaps—remains to be noticed. When a break is caused in a page by a diagram or a table of statistics, the subject-matter of the first column is carried on, after the break, sometimes to the foot of the page, sometimes to the top of the second column; and in one instance an amusing change of meaning is caused by reading on in the wrong direction.

We have confined our remarks mainly to the volume relating to Lower Egypt, partly because the second volume—consisting for the most part of a straightforward description of the successive objects of interest on the banks of the Nile—calls for no detailed criticism, and partly because, in the absence of any other English guide to Upper Egypt, those travellers who are unable to read German must use Murray, good or bad. However, after a careful examination of Part. II., we can confidently say that an English version of Baedeker's "Upper Egypt" does not seem likely to be so profitable an undertaking as it did a year ago.

CARTER ON EYESIGHT, GOOD AND BAD.*

THE author's long professional experience gives exceptional weight and importance to the scientific opinions put forward in this short treatise upon Eyesight, Good and Bad. Plain and simple rules for the exercise and preservation of vision need to be at least as much based upon wide and persistent observation as upon independent study of the physiology of the visual organs, or of the properties and influence of light in relation to the eye. As Ophthalmic Surgeon to St. George's Hospital, Mr. Brudenell Carter had for many years ample means of observing and classifying the various forms of disease to which the most delicate organ of the animal frame is liable, and he was thus enabled to fortify by copious notes of observation the lessons delivered by him as Hunterian Professor of Pathology and Surgery to the Royal College of Surgeons of England. The stores of knowledge and the therapeutical experience thus acquired will, we are glad to think, obtain a still wider field of usefulness by being embodied, as far as is possible, in the little manual now before us. Much of the time of every ophthalmic practitioner, as of every consulting physician, is taken up day by day, as our author's experience forcibly impressed upon him, in repeating to successive patients precepts and injunctions which ought to be universally known and understood. To make generally available these simple and ever applicable maxims, together with the scientific grounds upon which they rest, is the object he has proposed to himself in compiling the present work. He has no intention of entering more minutely into matters of anatomical detail than may be requisite to bring home to the ordinarily educated mind the reasons for the practical rules which he is desirous of enforcing. To the same extent he would take his readers over the elementary ground of optics, touching briefly on the simple properties of light and the formation of images by lenses, in order to illustrate the mode in which objects are figured upon the retina by rays passing through the crystalline lens of the eye. The use of the ophthalmoscope in investigating the functions of the organs of sight and detecting their hidden maladies is here pointed out, as well as that of the contrivance of Dr. Snellen of Utrecht for testing the acuteness of vision by test-types seen under various angles or at various degrees of distance. The curious lacuna in the field of vision, known as the blind spot, first discovered by Mariotte in the reign of Charles II., is explained. The author then passes on to one of the most prominent topics of his work—near and distinct vision, and presbyopia, or aged sight.

Comparable as it is in many respects with a transparent circular lens or disk of glass or other material, the crystalline lens of the eye is not a rigid or passive organ. If such were its nature, its influence in refracting the rays of light which enter by the pupil would be always the same. But it has been found by the labours of Donders, Cramer, and others, to have a certain power of adjustment, known by the name of "accommodation." A small muscle called the ciliary muscle, or muscle of accommodation, has been shown to produce an increase or diminution in the convexity, and also in the power, of the crystalline lens. In fig. 30 our author makes clear in a diagrammatical form the exact nature of this change, whereby the anterior surface of the lens becomes more convex and the pupillary opening smaller; one half of the figure showing the parts at rest, and the other half showing them as they are when accommodation is being exerted, the relative position or configuration of the ciliary muscle being indicated in each case. This change becomes tantamount to inserting an additional convex lens within the eye, and the amount of additional refracting power which can thus be added is capable of definite measurement. For every eye there is a point within which clear vision is no longer possible without optical assistance; and this, which is called the near-point, marks, Mr. Carter explains, the limit of the power of accommodation. Three classes of normal vision are to be distinguished, —(1) when the eye can unite parallel rays upon its retina, its axial and focal length being the same; (2) when the length of the axis is less than the focal length, the eyeball being flat, in which case the focus of parallel rays would always fall behind the retina could they pass through its tunics—this is called the hypermetropic state; (3) when the axial is greater than the focal length, the eyeball being comparatively convex and the pencil of parallel rays falling in front of the retina—this is the myopic state. In neither of the two latter states—called by the common name of ametropic—can there be by nature strictly defined images of distant objects upon the retina, which receives instead but a more or less diffused patch of light, technically called a diffusion circle. For the hypermetropic eye a convex lens is required in order to place the focus of parallel rays upon the retina, and for the myopic eye a concave lens, the degree of ametropia being definable in terms of the power of the correcting lens in the dioptric scale of measurement which Professor Donders has enabled us to substitute for the empirical and inexact method of graduation previously in use amongst opticians and surgeons. A hypermetropia of two dioptrics describes excessive length of sight, which requires a convex lens of two dioptrics for its complete correction; and a myopia of two dioptrics is one which requires a concave lens of two dioptrics. In many persons the two eyes are of unequal refractive power, calling for a combination of artificial lenses or spectacles adjusted to suit the inequality.

By the power of adjustment or accommodation before spoken of, the focal length of the eyesight is unconsciously yet rapidly enabled to bear upon and to define objects near and distant. The amount of this power of accommodation can also be expressed by the dioptric scale. Thus, in the case of an emmetropic eye, which can see clearly objects indefinitely distant and can also see small objects clearly at twenty centimetres, but not at any shorter distance, the effort of accommodation which is exercised in seeing at this near point is optically tantamount to placing within the eye an additional convex lens of the same focal length as the distance of the eye to the near-point—in this case a lens of five dioptrics. Were the near-point at twenty inches or half a metre, then the accommodation would be equal to a lens of two dioptrics. As life advances, the crystalline lens gradually loses its elasticity and becomes more and more rigid, the power of accommodation consequently diminishing, and the near-point receding further and further from the eye, whatever its original power of refraction. This is the condition known as presbyopia or aged sight, which generally begins to be felt between the ages of forty and fifty;—

> Taking the mean of many observations, we find that at ten years of age the accommodation is equal to a lens of 13 dioptrics, and the near-point is at 3 English inches. At twenty-one, the accommodation has fallen to 9 dioptrics; and the near-point has receded to 4·5 inches. At forty, the accommodation has fallen to 4·5 dioptrics, and the near-point has receded to 9 inches. At fifty, a great change has taken place. The accommodation is then only three dioptrics, and the near-point has receded to 13 inches; at sixty, the accommodation is only 1·5 dioptrics, and the near-point is at 26 inches; while at seventy-five the accommodation is wholly lost, the eye is passive, and the near-point is therefore at infinite distance.

A well-conceived diagram is added to make clear at a glance the comparative effects of declining accommodation in relation to age and to original power of refraction. The same scale will be found of use in determining the degree of optical power required in each individual case to supply the deficit of advancing age. Our author protests against the popular prejudice as to the hurtful effects of wearing glasses, a fallacy which leads to the exclusion from workshops of many a good workman who at the age of fifty or so shows signs of failing sight. That there is no harm in the habitual use of a convex lens is shown by the fact that watchmakers are by comparison, as a class, enviably free from eye diseases. His practice in an ophthalmic hospital has convinced Mr. Carter that

* *Eyesight, Good and Bad: a Treatise on the Exercise and Preservation of Vision.* By Robert Brudenell Carter, F.R.C.S., &c. With numerous Illustrations. London: Macmillan & Co. 1880.

the habitual exercise of the eye upon fine work tends to the development and preservation of its powers. Nor is the reason far to seek, seeing how largely the strength of vision depends upon the accommodation lying in the ciliary muscle, which, like all muscles, is fortified by exertion and atrophied by disuse. Many a case of glaucoma easily curable by an early operation has been erroneously met by supplying stronger and stronger glasses, to which the resulting blindness has been most unfairly set down. Our author in his defence of glasses tends, it may be thought, towards the opposite extreme. He would seem to fit the whole human race sooner or later with spectacles. In people with "wonderful sight," who can read without spectacles at seventy or eighty years of age, he sees no wonder at all. By their loss of accommodation they are simply reduced to the state of short-sight of three dioptrics, and enjoy the usual immunity of that state. He pictures vividly at the same time the delight of the myopic on finding their horizon of sight and power of defining objects suddenly enlarged by being fitted with concave lenses of the proper dioptric power. Chief among these joys is that of following the play of expression on the faces of persons with whom they converse. For want of this reciprocal power the speech of short-sighted persons often becomes indistinct; the unconscious action of the lips in response not following those of the other speaker. A lady who had for many years been engaged in teaching had her myopia corrected by proper glasses. Her first exclamation of pleasant surprise was an emphatic commentary upon the state in which her life had until then been passed. "Why, now I shall be able to see the faces of the children!" To the public speaker or preacher there can be no more serious drawback than being unable through shortness of sight to note the play of features and to rivet the gaze of his hearers.

In treating of the causes of myopia Mr. Carter takes note that, while this defect may be in many cases set down as hereditary, there is little definite evidence upon this point. Every one may have known cases of the most extreme differences of eyesight in children of the same parents. The most careful observations upon myopia in infants and young persons are those of Dr. Cohn of Breslau, who examined the eyes of 10,060 children, and found, out of this number, 1,004 who were myopic. The defect he further found to increase steadily as his observations rose from the elementary to the higher classes in the schools. Bad light was an unvarying concomitant in conditions of this kind, as was also the faulty construction of desks and seats, causing the children to stoop over their work so as to bring their eyes closer to it; both causes compelling an undue amount of convergence effort, fatiguing the sense, and accustoming the eye to a short focus. To the same result would contribute the odiously contracted type and coarse paper of German school-books in general. No wonder that the Germans are by far the most habitually be-spectacled race. Those who, on the contrary, live open-air lives, with their gaze most commonly fixed upon far-off objects—sailors, soldiers, field-labourers, and the like—are notable for their long and vigorous sight. Mr. Carter's precepts for the care of the eyes in childhood, as well as for their preservation in manhood and declining years, deserve to be read with all attention. His remarks upon natural and artificial illumination are of no less value, and may be the means of correcting many an injurious habit, and of bringing comfort and peace to many a mind tortured by dread of losing the most precious of nature's gifts. The cases of practical cure which he is able to exhibit will give confidence to those who, with the terrors of blindness before them, have recourse to his teaching. The influence of healthful habits of life towards the preservation of the eyesight is insisted upon, and many simple rules are laid down for the treatment of accidental injuries to the eye, and the avoidance of unhealthy and injurious strain. Several useful contrivances for saving effort to the weak-sighted, such as Prescott and Thursfield's writing frames, and the American type-writer, are explained and illustrated; and the practical hints with which the work closes upon the choice of spectacles will be of great service to sufferers from every kind of defective vision.

The time has been when asthenopia, or weakness of sight, was commonly regarded as incurable. There are, unhappily, cases in which failure of reflective power in the retina, or deadness of the optic nerve from paralysis or other causes, may baffle the utmost skill and resource of the oculist. Into extreme cases of this kind Mr. Carter does not enter at any length, but his remarks are full of hope for a large class of patients in whom the cause of distress is traceable to muscular fatigue. Donders, when he first discovered the nature and frequent existence of hypermetropia, was disposed to trace nearly all examples of asthenopia to the strain which was thrown upon the muscle of accommodation by its endeavours to correct the flatness of the eyeball. But this conclusion was modified by the observation that some asthenopic patients were myopic, or even emmetropic. Von Graafe was inclined to refer these cases to fatigue of the internal straight muscles by the act of maintaining convergence for some definite distance, rather than to fatigue of the accommodation muscle. He proposed a division of asthenopia into accommodative and muscular, according as the effort which occasioned distress was that of accommodation or of convergence, the internal straight muscles being in the latter class of cases the subjects of a peculiar weakness which he called "insufficiency," and which he proposed to measure by means of divers tests. Later observations have not confirmed his hypothesis, nor established the value of his tests, but have tended to convince Mr. Carter that asthenopia may in almost all cases be referred to a want of harmony between the accommodative effort and the convergence effort, the muscular fatigue being due, not to the absolute exertion of either function, but to endeavours to combine the two in proportions which disturb the material relations between them. Measured by the natural or emmetropic standard, the eyes will in hypermetropia be called upon to exert accommodation in excess of their convergence, in myopia to exert convergence in excess of their accommodation. To redress the balance and take off the injurious strain, our author prescribes a regulated course of reading by the aid of properly adjusted glasses. The expedient of resting the eyes, so commonly recommended, he considers to be, save in cases of inflammation, the surest way of increasing weakness, through disuse of the nervo-muscular apparatus. The instances of cure which he has to cite as the result of this judiciously graduated process of exercise may well revive the hopes of many a patient who has been a prey to the fear of blindness.

On colour vision and colour blindness our author has a short chapter full of matter, and upon the subject of squinting he is able to clear up briefly many popular errors. Astigmatism or distortion of the cornea—the vertical curvature being unequal to the horizontal—is no less clearly explained, together with its mode of correction by means of plano-cylindrical lenses. The detection and measurement of this defect are best attained by the use of the series of letters striped at different angles, designed by an American physician, Dr. Orestes Pray. That astigmatism when uncorrected produces distortion of the shapes of objects, and that the correctness of an artist's drawing can have been disturbed by such a cause, Mr. Carter holds to be utterly without foundation, referring, we presume, to the observations of Professor Liebreich not many years ago in reference to the later drawings of Turner. Before abandoning this ingenious explanation of unquestionable signs of decay in the powers of that great painter, we should prefer seeing the subject treated with greater fulness than Mr. Carter has found compatible with the scope of his valuable little work.

THE WATERING-PLACES OF GERMANY, AUSTRIA, AND SWITZERLAND.*

THE publication of volumes like this of Dr. Gutmann's is one proof among many of the revolution that modern progress has been gradually introducing in the treatment of disease. We cannot suppose that our fathers enjoyed any immunity from those insidious illnesses which sap the health and dash the spirits, although without showing the acute symptoms which have more immediate interest for the undertakers. But if those complaints existed, comparatively little was heard of them; and a man who found himself mysteriously but gravely affected calmly made up his mind for the worst. He might have recourse to dosing, drenching, and bleeding; and his doctor and apothecary were only too ready to accommodate him in the application of those decisive remedies. Possibly he recovered; more probably he died and made no sign. But nowadays, if he has leisure and credit with his bankers, he may have any number of new chances in his favour. No doubt the family medical man would gladly monopolize the care of his ailments; but fashion and the developments of science have put that altogether out of the question. Everybody knows that when a malady of difficult diagnosis is slow or chronic, there need be no final sentence of death till a change has been tried, with a visit to some waters. So the domestic physician makes the best of a disagreeable business, and with the pleasantest manner he can assume for the occasion, recommends the patient to pay a visit to the Continent. And for one of these wanderers in quest of health who carries in his system the germs of dangerous or deadly disease, there are at least a score who are either mere *malades imaginaires*, or, at worst, very slightly hit. There are the men who have more or less overtasked themselves with brain-work or business anxieties of one kind or another; there are the women who have been living too fast through the fashionable season of some great city; there are the girls who are the offspring of marriages between the two, and who show hereditary tendencies to hysteria or to occult disorders of the nerves. A highly artificial life takes heavy toll of its victims, and relief is to be sought in the kind of regimen which puts the pleasantest form of restraint on artificial habits. Here is a specific which the most complaisant of physicians may prescribe, in the summer or autumn visit to some favourite health resort. The mere change of air and scene raises the spirits to begin with. As languor vanishes or pain is soothed, the faint hopes with which the invalid came grow into exhilarating expectation. The visible relief is worth some sacrifice, and a certain amount of privation brings its speedy reward. The habits of the place, to which you must inevitably conform, are all in favour of the cure. It is no use to sit up of an evening, because you will find nothing to do and nobody to keep you company; and moreover the life in the open air makes you drowsy. As you go to bed long before your usual hour, naturally you awaken early; and when the sun is shining warmly into the room, there is nothing to be gained by lying simmering in the blankets. Besides, you are bound by the orders of a doctor in whom you begin to believe, to present yourself in

* *The Watering-Places of Germany, Austria, and Switzerland.* By Edward Gutmann, M.D. London: Sampson Low & Co. New York: Appleton & Co. 1880.

the throng round the pump at a certain hour in the morning; and when all the world is astir, the attraction to follow is irresistible. Then a breath of the cool fresh air of the early morning is one of those innocent forms of intoxication in which the most *blasés* delight the most. It gives you moreover an agreeable appetite for breakfast, if you have not inflated yourself to excess with mineral water. The simple coffee and bread and butter have the flavour of the most exquisite delicacies, and digestion is already smoothly at work before the healthful repast is well finished. An early dinner follows in due course; and as you have called it dinner instead of lunch, you do not feel bound to gorge yourself in the evening. A light supper follows a moderately long excursion; while in place of sitting in confined rooms through the day, you have been sauntering through shady woods, fragrant with the scents of their flowers and foliage. No wonder that, notwithstanding some occasional imprudence when the *menu* of the dinner-table is more inviting than usual, you make marked and steady progress, and find health and spirits "on the mend." And this without taking the waters into account, though no doubt they often have many of the virtues with which their most enthusiastic advocates credit them. Then, finding yourself patched up and refreshed towards the end of the bath-cure, you begin to remember that the life is monotonous, and you grow ungratefully impatient of its salutary restraints. You leave the bath for a little tour, like a schoolboy broken loose for the holidays. You slip the bit out of your teeth, give the rein to your imprudences with reinvigorated zest, and, the reaction from the regimen being proportionately violent, sooner or later you are worse than you ever were before. So the following season you are more than ready to return to the health resort that certainly did you infinite good. And thus there is not a bath of any consequence on the Continent that does not come to have its regular *clientèle*, who bequeath their belief in the virtues they have abused to the children who inherit their predispositions to evil. The Germans especially, year after year, make penance, or, at all events, restrictions, alternate with and atone for excesses. And not a few English and Americans are falling into this German fashion, and setting examples which many of their country people are beginning to follow.

It is for the benefit alike of those who are really afflicted with some malady and of others who may be all the better for a change though there is nothing serious the matter with them, that Dr. Gutmann has written this "popular medical guide." Of the volume itself there is not much to be said, since it does not profess to contain anything that is very new or original, except that it will be found a compact and useful little handbook. The author is no fanatic in his belief in particular springs, though he does go so far as to close one of his chapters with the assurance that if you do not become impatient, but "remain, drink and bathe, you will succeed." What he impresses in the first place upon his readers—and the warning is specially needed by Americans, who are too apt to go about their cures, as about their travels, in red hot haste—is the necessity of taking the waters deliberately. Invalids are inclined to lose hope at once if they do not show immediate signs of amendment; yet it is a commonplace maxim of the doctors at most of the spas that you are very likely to feel worse before you become better. Then imprudences, to which temptations abound, are apt to defeat the object of the visit. A patient, in his great haste to get well, swallows inordinate quantities of fluid, whereas the system can only assimilate moderate doses, though these may be gradually and judiciously increased. Exercise is an excellent thing, and is enjoined upon all who are capable of taking it. But exercise should never overtax the strength, and the pedestrian's feelings of fatigue are warnings that should always be attended to. He will do wisely, at first at least, if he limits himself to long saunterings in the alleys and woods that almost invariably surround the Kursaals. These pleasant strolls may be prolonged indefinitely; and there are seats in abundance where you may repose and recruit the forces. But the impetuous invalid, exhilarated by the air and possibly by the water, fancies he can hardly have too much of a good thing, and recklessly abuses the strength he is recovering. Consequently the waters fail of their effect on a frame that is always being artificially enfeebled. Indiscretions in diet are of course another snare. Patients, if they only knew it, as Dr. Gutmann takes care to point out for their comfort, are far more generously treated than they used to be, according to the generally received modern regimen of the bath faculty. Old notions have been exploded as to many simple luxuries of the table which were supposed to clash with the chemical action of the water; and things that once were rigidly proscribed are now permitted to be used in moderation. But moderation must still be the great rule of bath-life; and moderation is a relative and elastic term, which invalids are too much inclined to interpret to their injury. The fresh air and the exercise make them hungry, and they indulge their improved appetites to excess, and are even guilty of the insanity of indigestible suppers. Dr. Gutmann, in laying down general rules, would diet them somewhat too meagrely, as it seems to us. A light breakfast, a light dinner, and a scanty supper may be all very well in certain cases; dyspeptics and those who are suffering from indigestion may be easily persuaded to put the muzzle on for their own sakes, since retribution is sure to follow swiftly on imprudences. But bath-life would become intolerable on such a *régime* to others who have the free use of their legs and whose stomachs are in fair working condition. Then appetite must be, in a measure, a question of atmosphere. Thus a man who gasps and perspires through a hot summer in the depths of the confined valley of Ems—which Dr. Gutmann, by the way, with most extravagant laudation, pronounces the gem of the German spas—will rather have to fillip his appetite than to curb it. On the other hand, if he is drinking the iron waters of Schwalbach and walking about its airy and lofty table-lands—still more, if he is inhaling the iced breezes of the Upper Engadine—he will find himself ravening for his food like a wolf, and rising from heavy repasts with cravings unsatisfied. Dr. Gutmann objects most decidedly to the *table d'hôte*. The variety of dishes, he says, induces invalids to overload themselves with very indigestible food. "People accustomed to plain living at home, "delighted by the novelty of sitting at a large opulent table, in the company of fashionable society, are too much inclined to yield to the temptation and indulge too freely in the consumption of ragoûts, heavy puddings, and all kinds of compound dishes." As to the "opulence" of the modern *table d'hôte*, Dr. Gutmann is at issue with his countryman Mark Twain, whose *Tramp Abroad* we recently noticed. Mr. Twain asserts that at the *table d'hôte* nowadays you may starve in the midst of apparent plenty; and on the whole we are inclined to agree with him. The *table d'hôte* has changed greatly for the worse in the lifetime of the present generation. But, as a matter of fact, there are *tables d'hôte* and *tables d'hôte*; and while those at certain of the baths are simple to parsimony, and are served seemingly after *menus* drawn out by the doctors, at others, like those of Wildbad, for example, the *cartes* are as liberal as the cookery is unexceptionable, and the patient may undoubtedly be led into temptation. By the way, Dr. Gutmann rather oddly recommends those who dine at the *tables-d'hôte* for the sake of the society they meet there, to seek fashionable company at the restaurants instead, where, at the same time, they can set a limit to their dishes. But while a man may make acquaintance with his neighbours at a public dinner-table, and possibly follow it up if the beginnings are mutually satisfactory, it would be a strong measure for even the most enterprising citizen of the States to cross to an isolated table in a restaurant, and, having singled out some particular group that took his fancy, insist on carrying their intimacy by storm.

Dr. Gutmann seems to write of most of the baths either from personal knowledge or good information. With some of them, such as Carlsbad, he is evidently much better acquainted than with others; and on these he expatiates at greater length. His practical information as to the qualities and composition of the springs, the complaints for which they are suitable, the natural attractions of the neighbourhoods, the proper seasons, the routes, the hotels, &c., will be found generally trustworthy and very useful. In his recommendations of the hotels, however, he makes some unaccountable omissions. Thus at Schwalbach he says nothing of the Allée Saal, certainly by far the first in point of situation, and as certainly behind none of the others in comforts. At Wildbad we hear nothing of the Hotel Klump, one of the best houses in Europe; while the very bulk of the huge Vierjahrzeiten at Wiesbaden might have assured it, we should have fancied, against being overlooked; and, unless the management has greatly changed very lately, it certainly deserves honourable mention.

POETS IN THE PULPIT.*

AT a series of entertainments called "Sundays for the People," Mr. Haweis has been giving recitations from English poetry interspersed with moral remarks. The moral remarks and the selected passages are now printed together, under the title of *Poets in the Pulpit*. To compel poets dead and gone to come into the pulpit seems rather a violence to good taste, but the name of Mr. Haweis's little compilation is perhaps the worst thing about it. A certain school of critics is shocked when any one proposes to disengage the edifying quality of poetry, but we need not be so fastidious. Poetry, of course, is an art, like another. To point out the morality in poetry is like dilating on the medical qualities of a flower before we have admired its colour and perfume. But the people, especially on Sunday evenings, love to have it so. A practical race does not care to linger over the music and the colour, so to speak, of the poet's work, but prefers to ask, "What good will these lines do our immortal souls?" Thus the Lotus Eaters may be made to point the moral of industry, punctuality, and despatch in business, while the "Sleeping Beauty" can be twisted into an allegory in favour of early rising. Mr. Haweis is scarcely to be blamed for humouring the popular taste. An art which deals so intimately with man in all his relations as poetry does, cannot but be deeply charged with moral ideas. The more universal the poet, the more must thoughts about man's duty and destiny occupy his muse. And though the expression of these thoughts is not, in logical language, the *differentia*, the peculiar mark of poetry, it is the side of poetry in which a popular audience is most interested. It is also the side of poetry which may least incongruously be discussed from the pulpit. We cannot, therefore, ask Mr. Haweis for complete criticism, but merely for moral exposition.

Mr. Haweis is of opinion that all our poets "condense the life of your age into words that breathe and thoughts that burn" (*sic*), and he mentions Mr. Swinburne and Keble among other examples of this condensing power. But he did not, we regret to say, devote

* *Poets in the Pulpit.* By H. R. Haweis. London: Sampson Low & Co. 1880.

a sermon to "Dolores," and treat the people to "a nicht wi' Swinburne." Mr. Haweis is so plucky and ingenious an expositor that we feel sure he could have extracted edification from "Félise," or derived a theory of the Christian life from Mr. Dobson's *Vignettes in Rhyme*. But, though bold, he is discreet, and his lectures begin with milk for literary babes, with notes on Mr. Longfellow. From a brief biographical paragraph we learn that Mr. Longfellow was "run" for the Lord Rectorship of Glasgow University in 1874, but was defeated by "Benjamin Disraeli, Earl of Beaconsfield." It scarcely seems six years since Mr. Disraeli became Lord Beaconsfield. The political contest between the statesman and the American poet is one of the funniest even in the grotesque annals of Glasgow University. The words with which Mr. Haweis ends his critique of Mr. Longfellow seem to us very much to the point:—

> Take home to your hearts the warmth of his sweet natural religion; take home the peaceful and quiet contemplation of death and the grave, and the bright glimpses of the shining fields beyond; take home his manly courage, his earnest endeavour after all that is noble, and sweet, and upward; take home his unstained aspirations, his sense and belief in the triumph of good. He sends you forth into the New Year, but he bids you tread its threshold with a firm and light step; before you lies an unknown, untravelled world.

In these words Mr. Longfellow's moral qualities—and they are his chief qualities—are very well summed up. Mr. Haweis wisely abstained from reciting "Excelsior," fearing, perhaps, that the people would join in, as in a popular chorus. But it is odd to find Mr. Haweis saying that "perhaps in the 'Psalm of Life' Longfellow is sweetest and most powerful." The "Psalm of Life," if there be any meaning in the English language, is gibberish. Let us analyse two of the verses:—

> Lives of great men all remind us
> We can make our lives sublime,
> And departing, leave behind us
> Footprints on the sand of time:
>
> Footprints that perhaps another,
> Sailing o'er life's solemn main,
> A forlorn and shipwrecked brother,
> Seeing, shall take heart again.

Even if one can conceive of life as a "solemn main," bordered by "sands of time," how can the mariners on the main leave their footprints on the sands? And what possible comfort can footprints on the sands be to a shipwrecked brother who, despite his shipwreck, still keeps persistently sailing o'er life's solemn main? The brother must have had very sharp eyes if he could see footprints on the sands from his raft, for his ship is supposed to have been wrecked long ago. Perhaps Mr. Longfellow was thinking of the footstep which Robinson Crusoe found on the sand of his desert island. But Robinson was not sailing when he detected that isolated phenomenon; nor, when he saw it, did he "take heart again." The fact is that even Robert Montgomery never wrote greater nonsense than the "Psalm of Life." The poem is popular because the public vaguely feel that the author means to be very improving. Like the "Northern Farmer," they "think he says what he ought to ha' said," and they go away. Mr. Haweis even sends them away with that amazing remark about Longfellow being "sweetest and most powerful in the 'Psalm of Life,' as, indeed, he is there most admirably concise." Concise! A poet tells us "in the bivouac of life" not to be like "dumb, driven cattle," but to be "a hero." What an alternative, either to be cattle in the plural or a singular hero! And what business have cattle in a bivouac?

When Mr. Haweis comes to Mr. Tennyson, he selects as the Laureate's characteristics his depth and sobriety of thought, his wide sympathies, and his moral and religious instincts. Mere critics of poetry, as poetry, would select other qualities; but Mr. Haweis has to adapt Tennyson to pulpit purposes. Much that he says is true, though this does sound a little odd, "How sound and sweet are his words on the great question of the redistribution of property!" If that great question were ever mooted in practice, the Laureate's language, we fear, would be rather strong and direct than sound and sweet. But we hurry on to what is the real point in Mr. Tennyson, as in Mr. Browning, Mr. Longfellow, and the rest. They are all optimists. All of them hold, in the geographical language of one of Dickens's characters, that "things will come round and be all square." "Our poet," says Mr. Haweis, "like all good men and good women, is at the bottom an optimist." A pessimist poet, like Leopardi, would be worse than useless in the pulpit. Nothing could be done with a writer who said, like the speaker in Clough's "Easter Hymn":—

> Of all the creatures under Heaven's high cope,
> We are most hopeless who had once most hope,
> And most beliefless who had most believed.

Such a poet, at most, could only serve as an "awful example." And if we look at modern poetry, at the poetry of men who have lived since the "immense hope that traversed the earth," became more dim, we do find them optimists. They more or less "faintly trust the larger hope." They hold that

> all, as in some piece of art,
> Is work co-operant to an end.

As Mr. Haweis says of Mr. Browning, "He is passionately wedded to this world; everything about it is full of teeming interest for him; and yet the motto he has selected for death rules life—it is the eternal 'Prospice' or 'Beyond.'" Thus there is scarcely a pessimist poem of any mark, if we except *Atalanta in Calydon*, in an age when pessimism has some philosophic popularity and vogue. This is only one of many proofs that pessimism is practically impossible, that it will not work, that no fruit grows in its soil or under its air. Mr. Matthew Arnold, whom Mr. Haweis seems to find ill-adapted for pulpit purposes, has but little of Pangloss in his characters. Yet even his Empedocles is not really pessimistic:—

> I say, Fear not! Life still
> Leaves human effort scope.
> But, since life teems with ill,
> Nurse no extravagant hope.
> Because thou must not dream, thou need'st not then despair.

Sénancour was certainly something of a pessimist, and the verses which Mr. Arnold has written on his *Obermann* are not precisely cheerful. Yet even they end where the poet's vision, "far in the Valais depth profound, beholds the morning break." What morning, what hope is there for him who follows on Obermann's track? There is no explicit answer; there only remains the vague universal protest against pessimism, against the bleak air in which art can never flourish, and in which life certainly ceases to be worth living. This poetical protest is so far witness to the truths that are their own evidence, and Mr. Haweis naturally makes the most of this poetical optimism.

There are passages in *Poets in the Pulpit* which seem lacking in good taste—there is, for example, an astonishing paragraph about Mr. Browning—and there are pieces of criticism which palpably miss the point. Mr. Haweis, for example, does not seem even to have noticed the spiritual conceit of "St. Simeon Stylites," in his long expository address on that poem. A critic who, like Mr. Haweis, can recall "but two instances in which the dread passage of the soul has been described in poetry"—namely, by Pope and by Mr. Browning—needs to be reminded of the *Dream of Gerontius*. As a matter of expression, we do not care to hear that Keats "owned quite a first-class poetic faculty, yet never lived to develop his gift." "The commonplace of Pope and the dulness of Addison" are regretted by Mr. Haweis, that fiery child of an age which lives "at high pressure." We do not find Pope commonplace, nor Addison dull, but they both lived in an age when there were no Sunday Evenings for the People, and could not escape the faults of their period.

Mr. Haweis's book is by no means admirable; we might even call it commonplace in parts, if that censure did not put Mr. Haweis in the same category as Pope; but the people might spend their Sunday evenings in many worse ways than in listening to Mr. Haweis's recitations. Almost all the poetry he read was good, and his moral reflections could injure nobody.

THE FOLK-LORE RECORD.*

THE second volume of the *Folk-Lore Record* is decidedly more interesting both for students and for readers generally than the first, which we noticed some months ago (September 20, 1879). The objection which we urged against needless repetitions in the accounts of popular traditions and superstitions in countries where many or most of them had been already recorded with a plethora of variations, does not apply to the careful examination of the folklore and popular notions of the people of Madagascar by Mr. Sibree. From a transcript made by Mr. Thomas Wright nearly half a century ago, Mr. Thoms gives a version of the story of Thomas of Erseltown (Ercildoune), which, he remarks, is clearly not a Scotch, but an English, ballad; and in the tale of Conn-eda, the eponymous hero of Connaught, we have a remarkable specimen of Irish popular tradition, received from Abraham Macfoy, "possibly the last member of his profession known to have flourished in Ireland." This tale exhibits many features peculiar to Irish story-telling; but apart from the golden apples of Lough Erne, which reappear in the Gardens of the Hesperides, it has much in common with German and other popular tales. Conn-eda receives the clue for his search after the golden apples from the bird of knowledge; he rides a shaggy little pony which, like the steeds of Achilleus, is endowed with the power of speech, and which, being slain at his own request, revives as a young prince, who removes all difficulties from the path of his friend. He appeases the serpents which guard the entrance to the lake by throwing a piece of meat down the throat of each, and from the pony's ear he draws the things which are indispensably needed for the accomplishment of his task. Mr. Napier supplies a very interesting paper on old ballad folk-lore, while from Mr. Coote we have a valuable chapter on the neo-Latin Fay. Mr. Coote seems to regard the name of the Latin Fatuæ as the origin of the name of our fairies and fays; but he carefully guards against the error which confounds the Fatuæ with the Latin Fata, although in Italy the former name was softened down into the latter, and reappears in the Arthur story in the beautiful Morgan le Fay, whose ring endows Olger the Dane with unfading youth.

From these papers, and more particularly from Mr. Lang's preface to the volume, it seems not unlikely that a controversy may be raised on the distinction between folk-lore and mythology, and even on the reality of this distinction; and clearly, if the question is to be discussed, it is in every way best that it should be examined and settled at once. If the distinction cannot be maintained, the method and the conclusions of comparative mythology must be sensibly, if not seriously, affected. That a large number

* *The Folk-Lore Record.* Vol. II. London: Printed for the Folk-Lore Society. 1879.

of popular stories, so closely resembling each other as to be practically the same, are now being brought together from all parts of the world, it is impossible to doubt. Is the likeness to be accounted for on the hypothesis of importation or borrowing, or by the idea of lateral transmission from a common source, or by spontaneous growth in various centres brought about from similar conditions of life and thought? In dealing with this question we must, in the first instance, satisfy ourselves that our materials are sufficient both in quantity and quality to justify us in forming an opinion, and that we have really submitted them to a scientific classification. Otherwise we cannot fail to run from one extreme to the other; and instead of saying, as some have been supposed to say, that everything in mythology is the sun, we may commit ourselves to the conclusion that all myths are the product of purely savage fancy, working in a world in which the speaker drew, and could draw, no distinction between subject and object. The signs of this danger seem to be betrayed in many parts of this volume. There is no question that, in these popular stories, the attributes of speech and intelligence are extended to plants, stones, trees, and, in short, to all visible and sensible things; and that, for the framers of these stories, all nature exists in their consciousness, and their consciousness in nature, "in a confused nebulous way." It is true also that Ovid, and indeed others also, "make Callisto a bear, and the bear a star, and another bear the ancestor of the Arcadians." But how are we to be sure that these myths belong to the same class with the beast stories of the Bechuanas or other savages? Are we not in danger of going too fast, if we allow with Mr. Lang that "the Greek mythology, from the maiming of Uranus (as savage as anything in New Zealand legend) to the tale of Cupid and Psyche (which is found among the Zulus) is a confused tissue of barbarous invention underlying the delicate embroidery of true Greek fancy"? This is, in fact, to include well-nigh all Greek myths within the domain of folk-lore; and the argument is baited with the apparently simple assertion that these horrors and absurdities, which the solar theory, we are told, was designed to explain, are survivals of a savage fancy, "which still exists, and where it exists, produces stories as like Greek myths as neolithic are like palæolithic instruments." We thus reach something like a formulated theory in the conclusion that the barbarous legends of primitive man "were polished into epic and national traditions," some of them surviving only as *märchen* in the mouths of old nurses, and retaining even now, while "they often resemble in plot and incident the greater myths of Greece," "a still closer likeness to the legends of the Zulus and Bechuanas." It follows that "the germ of Greek and other great mythologies is to be sought in the known qualities of the savage fancy and in the habits of the savage mind"; and this conclusion applies to the legends of Œdipus, and Deianeira, of Tantalus and Pelops, as well as to those of Kronos or the Cyclops. But when Mr. Lang insists that this must be the case, and rejects the notion that myths, as he puts the matter, are to be traced to "a fancied stage of society in which everybody spoke allegorically about the sun and the clouds, and then forgot the meaning of what he had said," it may fairly be urged in reply that he is arguing somewhat hastily. Comparative mythologists have never said, so far as we are aware, that the same men who spoke allegorically, if the word is to be used, about the objects of the outward world, forgot what they themselves had said. Lapse of time and change of abode have always been laid down as the conditions necessary for the advancement of myths to their secondary stage; and if it be allowed that the Aryans in the mythopœic ages spoke allegorically, then the popular stories of Zulus and Bechuanas are allegorical also. This Mr. Lang would probably refuse, and he would be right in refusing, to admit. The question is one which must soon be seriously dealt with; and Mr. Sayce, in his *Introduction to the Science of Language*, has offered an answer to most of Mr. Lang's arguments. A myth, in his judgment, is "the speculation of a child which the grown man has treated as though it were the utterance of his own mature thought." The names in myths properly so-called are capable of analysis, and the myths themselves have a religious element which is absent from folk-lore stories. In the latter there may be many popular etymologies, but they are "comparatively unfruitful, changing or modifying only an unessential portion of the story, and not its whole character." Mr. Sayce admits, however, that "it is often difficult to draw the line between folk-lore and mythology, to define exactly where the one ends and the other begins, and there are many instances in which the two terms overlap one another"; but he protests strongly against the misuse of terms which includes myths generally under the head of folk-lore.

We are thus left with the task of classification; and by no other method can the problems before us be solved. The mere fact that a myth or legend exhibits features which seem coarse, uncouth, incongruous, or even gross, is no reason for assigning the myth in question to the ranks of mere folk-tales. In some instances the seeming coarseness veils a picture of wonderful truth and beauty; as in the story of the sixteen thousand one hundred maidens whom the Hindu god Krishna rescues from the giant Naraka, and to all of whom he is wedded in one and the same moment according to the ritual in separate mansions. We may dwell if we will on the sensuous imagination of a people familiarized with polygamy; but the essence of the story lies in the fact that every one of these damsels thought that the god had wedded her in her single person. Without the idea of the simultaneous marriage the story has no meaning. We have further to note that the maidens are by no means the only beings rescued from the monster whose name points to the blackness of darkness, and who is, in short, the Demon of Night, shrouding everything beneath his sombre veil. Like all these objects, the dew cannot become visible until the darkness has been conquered and dispelled; but when it has been driven away, the same sun is reflected in the thousands of sparkling drops. This story of Naraka is thus seen to be only another version of the Greek myth of Prokris, whose name marks her as the dewdrop, the child of Herse, the dew, and the unwilling rival of Eos, the morning. When, in Mr. Sayce's words, we know further

> that Kephalos . . . is but an epithet of the sun, as is the "head" of the horse in the Veda, the signification of the whole story becomes clear. Prokris is slain unintentionally by Kephalos, while jealously watching him through fear of her rival Eos, just as the dew in the early morning is parched up by the first rays of the rising sun.

But even among the number of stories which may be allowed to belong to the province of folk-lore we shall find many which cannot be accounted for by an offhand reference to the conditions of the savage mind generally. The Kafir legends of Uhlakayana have many points of likeness with those of our Jack the Giant-Killer, and the Greek tales of the Symplegades or of Charybdis and Skylla may be matched with stories belonging to Eskimos, Mongols, and Karens; and these resemblances, we may allow with Mr. Sayce, are sufficiently accounted for by the general condition of the minds of half-civilized men all over the world, and the circumstances amid which they live. But this theory will not explain the striking likeness and the not less striking points of dissimilarity between two such tales as the "Dog and the Sparrow" in Grimm's collection, and the old Deccan story of the "Parrot and the Nautch Girl." Any one who will take the trouble to compare these two stories will see that in their leading ideas they agree exactly, while the ways in which they are worked out are entirely different. The idea that the very singular framework of these tales could arise independently in different minds cannot be entertained for a moment. We cannot therefore believe that it was invented separately by Germans and by Hindus. We have, therefore, only the choice of two alternatives. Either the German borrowed the story from the Hindu, or the Hindu from the German; and then we have the difficulty that probably no borrowed story ever differed so widely from its original as the tale of Champa Ranee differs from that of the Dog and the Sparrow. Nor can we believe that the Hindu and the German should, each for himself, hit on the idea which makes a bird the avenger of wanton wrong and brings about the ruin of the wrongdoer through his own acts, while in each case the criminal swallows, or thinks that he has swallowed, his persecutor. If, then, the notion of borrowing must be given up, we must take to the alternative conclusion that the framework of the legend belongs to that distant time when the forefathers of the Hindu—the German and the Englishman—still shared a common home in Central Asia. But, ancient though it be, the tale is not, in strictness of speech, a myth. The names in it cannot be submitted to philological analysis; and the tales can at best be referred only to a class of stories which have their origin in proverbial sayings of a moral sort. Such specimens of distinctively Aryan folk-lore must be carefully distinguished from those popular stories which may be naturally suggested by the common sights or sounds of the outward world to the mind of any savage tribes. Nor must we be less careful in dealing with others in which elements belonging perhaps strictly to folk-tales are blended with others which are purely mythical. Some of the incidents related in the many versions of the Master Thief and the Shifty Lad may be simply the result of imagination working on in a channel opened out to it by a few mythical phrases; but the stories, in their leading idea, run up into the wonderful tale told of Hermes in the so-called Homeric hymn; and this tale resolves itself etymologically into a series of phrases describing the effects of air in motion. In these considerations we have a safeguard against the somewhat hasty generalizations of Mr. Lang; while we need scarcely say that they leave no room for the maintenance of an exclusive solar theory in mythology, in which, as Mr. Sayce very rightly asserts, we have a record of all the ideas of primitive man regarding the world around him.

REATA.*

We are in some doubt whether we are right in speaking of the author of this story as Mr. E. D. Gerard, for we should not be in the least surprised to learn that it is the work of a woman. We are in no less doubt as to the nation to which he belongs. He is, we feel sure, either a foreigner who has passed most of his life in Scotland, or a Scotchman who has passed most of his life abroad. At first we were inclined to suspect that we had before us only a translation, but this suspicion we soon dismissed from our mind. Yet the language in very many places bears unmistakable traces of a foreign idiom. It clearly shows that he who uses it has been from childhood quite as familiar with some foreign tongue as with English. The effect produced by this mongrel style is sometimes very droll. In one passage we read how a lover was attacked by a fever in the last weeks that he had to pass at the house of the lady to whom he was engaged. "This thought," we are told, "stung him like an irony of Fate." But there was

* *Reata: What's in a Name?* By E. D. Gerard. 3 vols. Edinburgh and London: Blackwood & Sons. 1880.

also another thought which "added fuel to his impatience. He had counted on the opportunities of this fortnight for putting the question of his interests in the most becoming light before his aunt's eyes." He got better, and had an interview with the young lady, at which he wanted to discover a secret which was carefully kept concealed from him. She was silent for a minute. "During that minute Otto was preparing to make the first step towards solid advantages." A few lines further down we find "his thoughts still running on the best way of broaching that tiresome subject." His servant just then rushes in "purple in the face, and gasping with excitement, giving out in broken accents something about horse-stealers. 'What's up next?' inquired Otto." The faithful servant, "not understanding even the drift of the excitement, but imagining that some sort of outrage was going to be done to Otto, stood by on one leg, breathing very hard, partly from having run so fast, and partly from agitation." Not many pages from this the heroine, in sending a copy of her father's will, writes to her correspondent, "I have had all the sums referred to named in Austrian coin. This will be more intelligible to you than the national coin, which figured in the original document." She adds, "I am placed out of the position of altering the conditions of the will." In one place a town is somewhat minutely described. After the author has mentioned the irregular rows of the trees he adds, "In all this there is nothing objectionable, and if it had not been for the bottomless state of roads and streets during half the year, &c." A long and somewhat curious account is given of a public ball in Austrian Poland. Towards the close of the evening we read that "the music came to an end, and was encouraged to resume." The dancing began afresh. One of the guests "greatly incommoded everybody, himself and his partners foremost"; another "precipitated himself into the crowd," when, "fired on by the desire to distinguish himself, he had got hold of a lady, who presented the appearance of a formless mass of purple silk, and was courageously towing her round the room." Fresh life had been infused into the party:—

There was no denying it, the ball was very animated, and everybody was satisfied with the *cotillon*. Now the final galop was being wound up with crackers, and the dancers were putting out their last energies for the last effort. . . . There were crackers in all directions; each gentleman got a handful, and cracked them with the ladies he wished to dance with; and in the background, to swell the noise, explosive pellets were used abundantly.

Perhaps the best example of the absurdity of Mr. Gerard's style is to be found in the following description of a scene on the ice:—

For by this time Halka had let go Otto's hand, and was skating backwards facing him. This mode of skating is a difficult one for a lady to attain, perhaps not even desirable to be attained; it must necessarily call upon the strength very much, and any appearance of putting out strength detracts from the charm of a lady's skating. No doubt there are many women who skate well backwards; but amongst ten of them nine will offend your eye by the suggestion of vigour in their movements, and only the tenth will glide along with that effortless swiftness which resembles the graceful swaying of a bird poised in mid-air.

The effect that is produced by three long volumes of such writing as this can only be fully felt by those who take the trouble to read them from the beginning to the end. The absurdity cannot be brought home by mere quotations. Mixed up with this strange mongrel English we have such Scotticisms as the following:—"I wonder what we will be doing next June?" "I daresay we will be sitting on some haycock or other next June." "I daresay I won't find them too hard." "By the provisions therein contained I will have a yearly income of two thousand florins." "Perhaps I will break my neck." It is almost a relief when we come across such undoubted English—novelists' English, we mean—as "the items of a paraphernalia" of a coffee-house. In spite, however, of this droll style, *Reata* can be read with some degree of interest. It is, indeed, insufferably long, but the reader in going through it must follow the example of the skilful skater, and "glide along with that effortless swiftness" which the author celebrates. In other words, he must not be afraid to skim and skip. If he has not acquired this art, and acquired it in a high degree, we would strongly recommend him not to begin. There are, indeed, circumstances in which we could conceive that a man might read *Reata* from the first page to the last. On board a ship that was becalmed on the Equator, for instance, or when weather-bound in a mountain hotel for a week together, he might go through it word by word, not only with patience, but even with some degree of pleasure. But in all the ordinary states of life it can only be enjoyed by means of frequent and wide skippings.

The plot may have been suggested by a story by Miss Drury which was published more than twenty years ago, and of which the title has escaped our memory. In that story the heroine, who when quite a girl had come into a great property, passed herself off as the humble companion of her elderly governess, whom she induced to play the part of the heiress. The hero, of course, was thoroughly disinterested, and in the end carried off both heroine and fortune, while there was a selfish lover who made love to the old lady, and found himself hopelessly fooled. The improbabilities of such a story are so great that not a little ingenuity is required on the part of the writer to overcome them. Mr. Gerard places the home of his heroine in a wild part of Mexico, while the hero lives in Austria. The scene changes backwards and forwards from one country to the other, till the time arrives for the heroine to come to Europe. Even then the secret is well kept; and it is not till the very end of the third volume that it is discovered by the people chiefly interested—the reader, unless he be very dull, has long made out the mystery—who Reata really is. The opening of the story we found not a little perplexing. In fact, we so soon lost our patience in trying to follow our author in the involved account he gave of the different branches of the Bodenbach family, that had we been free agents we should have abandoned the attempt in disgust, and not read a line further of their history. The author himself must have felt that his account was by no means clear, for by the time that he reached the twenty-fourth page, he evidently thought it needful to remove our difficulties by giving us a family tree. Surely a writer makes a great mistake who begins a long tale by wearying his readers. He should wait till he has caught their attention, and then he may perhaps venture to introduce them to a piece of genealogy and a family-tree. After all there was really no great need for making a difficult case of it. There were Bodenbachs in Austria, and there were Bodenbachs in Mexico. Between the two branches of the family there had been no communication for thirty or forty years, when news reached the Austrian branch that the Mexican Bodenbach was dead, and that his daughter Olivia was heiress to his vast property. She, it was assumed, was an elderly maiden lady who had once been for a short time engaged to the head of the family in Austria. It was not for a moment suspected that this lady had been dead at least thirty years, and that the present Olivia Bodenbach was the only child of a second marriage. The Austrian Bodenbachs meanwhile had become poorer and poorer, and had little but their nobility left. They were overjoyed to find that their relative in Mexico was eager to make their acquaintance. The younger brother, Otto, goes over to Mexico, and during his whole visit does not for a moment doubt that the heroine, Olivia Bodenbach—Reata, as she is called—is Fräulein Lackenegg, while the real Fräulein Lackenegg he holds to be his Aunt Olivia. He falls in love with Olivia and is accepted; and then he first learns those conditions of old Bodenbach's will which the heroine, to use her own language, "is placed out of the position of altering." Otto and his brother are both to come into a considerable share of their uncle's property, on condition that they marry some one of noble birth. Should they marry beneath them, however, they are to forfeit most of what he leaves them. The scene in which Otto tries to find out whether Reata belongs to the nobility is amusing enough, but it is too long to quote in full. He invents a Baron Lackenegg, whom he had met, he said, last year at Baden. "'Some relation of yours, I suppose?' he said. 'How little I knew then——' 'No; certainly no relation of mine,' Reata interrupted, decidedly; 'it couldn't be.'" On being pressed, she at last owned that her father had been a professor:—

"Where did he—did he——" began Otto, meaning to ask where the gentleman had hung out, but rather at a loss how to turn his phrase.

"Where did he practise?" completed Reata, readily. "Oh, at Heidelberg."

"Oh yes, the university," Otto answered, with skilful suggestion. "Was it mathematics, or philosophy, or——"

"Oh no, not the university at all," Reata again interrupted him. "And not mathematics or astronomy, or anything of that sort, but simply—*dancing*."

"Dancing!" echoed Otto, in perfect incredulity.

"He was a dancing-master; do you understand?" she repeated, with almost a little testiness in her voice.

"A dancing-master! Your grandfather a dancing-master!" he exclaimed, turning pale.

Otto returns to Austria, and marries an heiress of noble birth. Reata follows him, and there becomes acquainted with his elder brother Arnold, who is the hero of the story. Arnold is as proud of his noble blood as his old uncle out in Mexico had ever been of his; but in the end love proves too strong for him, and he proposes to the humbly-born Fräulein Lackenegg. His character is cleverly drawn, and the scenes between him and her are often lively and interesting. The author certainly has a considerable sense of humour, and manages more than once to bring his characters into the most absurd complications. The descriptions of Austrian life are often curious; those that he gives of Mexico are, we should imagine, drawn from his imagination or his reading, and not from real life. Certainly he does not succeed in bringing country life in Mexico before us in the same way that he brings life in Austrian Poland. It is a great pity that, with so much in his book that is really good, he should have gone so far to spoil it by a spun-out narrative, and by the strange jargon in which he so often writes. He shows in many places that he has a natural gift of expression and a certain power of writing vigorously. There certainly ought to be some language in which he can write well. If he has a native tongue—a tongue, we mean, which he learnt in his nursery, and in which he has been brought up—he would do well in future to keep himself to it, and to employ the services of a skilled translator to turn his writings into English. Let him, however, beware of engaging either a Scotchman or an Irishman, so that he may be sure of having an opportunity of studying in one of his own works—at all events, in the translation of one of his own works—the correct use of *shall* and *will*.

MINOR NOTICES.

PROFESSOR MORLEY can have had no easy task in the arrangement of a book of considerably over four hundred pages consisting of prose selections from the works of important English

writers from 1356 down to the days of the present reign (1). No one, it need hardly be said, could well be better qualified to conduct such an undertaking than Professor Morley, who brings to its accomplishment wide knowledge and generally accurate perception. In the beginning of his first chapter Professor Morley has some good remarks to make on the definition of prose. He touches briefly on the origin of prose-writing, on the definition of the title from the Latin *prorsus*, and goes on to quote Coleridge's remark that he wished our clever young poets would remember "his homely definition of prose and poetry—that is, prose is words in their best order; poetry, the best words in the best order." The definition, says Professor Morley, "may be homely; but it is not true. No writer of prose would wish to use second-best words. Setting aside the difference that lies deep in the nature of the thought, there remains only the mechanical distinction that verse is a contrivance for obtaining by fixed places of frequently recurring pause and elevation of the voice, by rhyme, and other devices, a large number of places of fixed emphasis, that cause stress to be laid on every important word, while they set thought to music." The remarks as to verse do not strike us as satisfactory, but what Professor Morley has to say of prose is valuable. He leads off after the preliminary observations, a few of which we have quoted, with some extracts from Mandeville, and in his second chapter he gives, amongst other excellent matter, the account left by John Rogers, the first of the martyrs under Mary, of his trial and condemnation. Coming down to the time of the later Stuarts, we find early in the sixth chapter a quotation from Dr. Wilkins, which at this moment has a special interest. Dr. Wilkins, who married Oliver Cromwell's sister Robina, and was made Master of Trinity by Richard Cromwell, "was one of the most ingenious men of his time. He was well skilled in mathematics, and had endeavoured to apply his knowledge to the well-being of society by stimulating men's minds with suggestions of possible mechanical inventions and of future conquests of nature." In one of these, as is seen from the quotation referred to, he anticipated M. Jules Verne and the ingenious person who has proposed to realize M. Verne's charmingly imagined submarine vessel, the *Nautilus*. "It will not be altogether impertinent," wrote Dr. Wilkins, "unto the discourse of these gradient Automata, to mention what Mersennus doth so largely and pleasantly descant upon, concerning the making of a ship, wherein men may safely swim under the water." He then went on to say that the feasibleness of such a contrivance was beyond all question, as was shown by the experiments of Cornelius van Drebbel, "but how to improve it unto public use and advantage, so as to be serviceable for remote voyages, the carrying of any considerable number of men, with provisions and commodities, would be of such excellent use as may deserve some further enquiry." He then goes on to discuss at length and with much keenness "the many difficulties, with their remedies," and "the great conveniences" of the proposed vessel; and in the course of his remarks he quotes from Mersennus an account of a prototype of M. Fleuss; "one Barrieus, a diver, who hath lately found out another art, whereby a man might easily continue under water for six hours together." Professor Morley's extracts are, as we have said, exceedingly well selected, and the volume is capitally illustrated.

Mr. Hollingshead's smartly-written volume of articles dealing chiefly with theatrical matters (2) would be amusing, if only by dint of its somewhat cynical frankness, a specimen of which is exhibited in the first essay in the book, which he ends with a statement to the effect that the qualities which are needed for the good government of a theatre are "precisely those qualities that make a successful cheesemonger." It does not follow that, if this is true of one theatre, it is necessarily true of all. In his preface Mr. Hollingshead describes himself as "a licensed dealer in legs, short skirts, French adapters, Shakspeare, taste, and the musical glasses," and this description may perhaps be taken in connexion with the statement just quoted. Mr. Hollingshead goes on to say that he is no longer a professional writer toiling for his living, "but an amateur, writing when I think I have something to say," and it must be admitted that there are certain things in the volume which were well worth saying. The author's remarks on music and dancing licences and theatrical licences deserve, for instance, serious attention; while, as we have hinted, there is plenty of amusement of a certain kind to be got out of the rest of the book. The paper which gives its name to the volume is perhaps the cleverest of the series. It consists of some random contributions to a new philosophical dictionary, from which we select these definitions:—

Legitimate Drama.—A drama whose authors are dead, and whose copyrights have expired.
House.—An instrument of Torture invented by builders.
Dry Wine.—Physic in a convivial bottle.
Nuisance.—Anything which I detest and you probably adore.

The words "new edition, revised and enlarged," on the title-page of the volume which Mr. Poole has edited (3) have a wider significance than has often belonged to them. Mr. Poole's object has been to popularize Lane's book, and to attain this a good deal of reconstruction, especially in the First Part, has been necessary. Mr. Lane's "Selections" were arranged to satisfy a natural wish on the part of ordinary readers to know something of the Koran, while suppressing any wearisome or offensive passage. But there were various points in the arrangement of the book which made it really fitter for the scholar than for the general reader, and it is by the removal of these that Mr. Poole seeks to fulfil the author's original intention. For Lane's Introduction, abridged from Sale's "Preliminary Discourse," Mr. Poole has substituted a well-written and interesting sketch of the beginnings of Islam.

Dr. Corfield's volume (4), which consists of a series of lectures delivered at the Rooms of the Society of Arts under the auspices of the Trades' Guild of Learning and the National Health Society, is one which should do excellent service. The writer's style is clear, his tone throughout just and moderate. If we were asked to single out from many good lectures one deserving special praise, we might perhaps call attention to that on "The Health of the Individual," which contains a very large quantity of useful information and instruction in a small space.

Mr. Palgrave's little volume (5) is very valuable as a book of reference, containing in small compass, and in a form easily taken in, much information of the highest interest to bankers, merchants, and financial and economical students. It is based on an earlier publication by the same author, and treats of the banks of France and Germany only so far as to show the variations in the value of money in those countries. But the accounts of the Bank of England since the Bank Charter Act was passed it analyses very fully, bringing out in a clear light the weaknesses of our existing banking system. The analysis of the balances kept by the London bankers with the Bank of England is especially interesting, and the dangers pointed out are real and obvious. The variations in the rate, too, are instructive and suggestive. But the book is for reference, not perusal. Going over much of the ground traversed by the late Mr. Bagehot in his *Lombard Street*, it serves to remind us of the loss suffered by monetary science in his death.

Mr. Rees's little biographies of Horace Vernet and Paul Delaroche (6) are well and interestingly written, and the illustrations which accompany them are a great improvement upon some which we have noticed in the same series. It was a good idea to include in the volume a series of brief biographies of the artists pourtrayed in Delaroche's well-known painting in the Hemicycle of the Palais des Beaux-Arts, of which a representation is given.

A third edition has been issued of Miss Kate Thompson's excellent *Handbook to the Public Picture Galleries of Europe* (7). For this carefully prepared small outlines of some two hundred typical works have been obtained and reproduced by the Typographic Etching Company. Also, for the first time, the Esterhazy Collection at Buda-Pesth is included in the volume, the value and usefulness of which are very great.

The admirably arranged General Index to the fifth series of *Notes and Queries* (8) bears curious testimony to the enormous amount and variety of information stored up in the pages of that quaint and most valuable paper. Lord Brougham was undoubtedly right in the remark quoted in Mr. Thoms's preface, that "the value and utility of the publication were increased tenfold by its capital indexes."

There is not very much to distinguish Mr. Browning's volume (9) from various others, the appearance of which is presumably due to the interest lately taken in South African affairs. His experiences, however—he began as an ostrich-farmer and ended as a soldier—are told in a simple and unaffected manner.

Dr. Hueffer has done well in collecting and republishing the series of articles and essays which make up the volume which he calls *Musical Studies* (10). In his preface the author makes some very pertinent remarks on the subject of such republications. To those who object to the perpetuation in book form of fugitive pieces it may be answered, he says, that "the present volume is part of an unmistakable movement in modern literature. The vast development of periodical publications within the last quarter of a century has drawn the best literary and scientific workers into its vortex. Few authors nowadays can withstand the temptation of the immediate and vast publicity conferred by the prestige of a first-class Review; fewer can materially afford to give years of, in most cases, ill-requited labour to the composition of a book." Books, properly so called, thinks Dr. Hueffer, are in consequence becoming rarer, and collections of essays are taking their place. However, as we have said, there is certainly no apology wanted for the collection and publication of these essays. They should be welcomed both by those who have and those who have

(1) *Cassell's Library of English Literature.—Shorter Works in English Prose.* Selected, edited, and arranged by Henry Morley, Professor of English Literature at University College, London. With Illustrations. London, Paris, and New York: Cassell, Petter, & Galpin.

(2) *Plain English.* By John Hollingshead. London: Chatto & Windus.

(3) *Trübner's Oriental Series.—Selections from the Kur-án.* By Edward William Lane. New Edition, revised and enlarged, with an Introduction, by Stanley Lane Poole. London. Trübner & Co.

(4) *Health.* By W. H. Corfield, M.A., B.D., &c. London: C. Kegan Paul & Co.

(5) *Bank Rate of England, France, and Germany, 1844–1878.* By R. H. Inglis Palgrave. London: Effingham Wilson.

(6) *Illustrated Biographies of the Great Artists.—Horace Vernet and Paul Delaroche.* By J. Ruutz Rees. London: Sampson Low & Co.

(7) *A Handbook to the Public Picture Galleries of Europe; with a Brief Sketch of the History of the Various Schools of Painting from the Thirteenth Century to the Eighteenth inclusive.* By Kate Thompson. Third Edition. With Illustrations. London: Macmillan & Co.

(8) *Notes and Queries.* General Index to Series the Fifth (1877–1879). London: "Notes and Queries" Office.

(9) *Fighting and Farming in South Africa: a Narrative of Personal Experiences in the Colony during the Years 1877–79.* By Fred. G. Browning, late of the Frontier Light Horse and 3rd Cape Yeomanry. London: Remington & Co.

(10) *Musical Studies: a Series of Contributions.* By Francis Hueffer, Author of "Richard Wagner and the Music of the Future," &c. Edinburgh: Adam & Charles Black.

not previously made their acquaintance in another shape. It is to be regretted that the author did not amplify the two somewhat bald letters from Bayreuth which are included in the volume.

We note the fifty-third publication of the *Foreign Office List* (11) and the nineteenth of the *Colonial Office List* (12). In the latter of these we would draw special attention to the useful and interesting historical notices of the various colonies.

Mr. Masterman's object in compiling his Handbook (13) has been to bring the whole body of Statute-law relating to Parliamentary elections into an easily accessible form, a task of some labour, on which he has evidently spared no pains.

The third edition of Mr. Chandos Leigh's and Sir H. Le Marchant's work on Election Law (14), edited by Mr. Anderson and Mr. Leigh, includes a new chapter on municipal elections, and the addition to the appendix of the Acts of 1880, with a note of the changes made by them.

The title of *Highland Legends* (15) is given to a new edition of Sir Thomas Dick Lauder's interesting collection of stories which was first published under the cumbrous name of *Highland Legends and Long Rambles to Shorten the Way*.

The latest additions to the *Chandos Classics Series* are the three volumes known as Roscoe's Spanish, German, and Italian Novelists (16). The only objection we have to make to these is that the type is somewhat bewildering; but possibly this, having regard to the size of the volumes, may have been very difficult to avoid.

The late Mr. Chorley had resolved to publish in a revised form some lectures which he delivered, first at the Royal Institution, and afterwards at Manchester and Birmingham. These Mr. Hewlett, carrying out his friend's desire, has now published under the title *The National Music of the World* (17). The lectures or essays are full of their writer's keen critical power, and are justly described by Mr. Hewlett as "a contribution of real value to musical literature by one eminently qualified to discuss the interesting and curious points with which it deals."

For the sixth edition of *Heat as a Mode of Motion* (18) Professor Tyndall has written a short preface, from which it seems desirable to quote the concluding passage:—

> On the continent, science leans on the strong arm of the State; in England its advancement must depend upon the sympathy of the public. Hence the supreme importance, in our case, of spreading abroad correct notions regarding its capacities, achievements, and aims. The practical triumphs of our day are obvious enough, and they are still frequently spoken of as if they constituted the entire claim of science to the world's attention. To some it seems a kind of handicraft, while others think it is, or ought to be, a mere congeries of facts. But they who regard it thus can know but little of the logic which runs through, and binds together, that "System of Nature" which it is at once the glory and the responsibility of science to reveal. I am far from claiming for science an exclusive position which would exclude other forms of culture. A distinguished friend of mine may count on an ally in the scientific ranks when he opposes, on behalf of literature, every attempt to render science the intellectual all in all. Ours would be a grey world if illumined solely by the dry light of the understanding. It needs equally the glow and guidance of high feeling and right thinking in other spheres. But this may be conceded while affirming the just and irrefragable claim of science to a more liberal space in public education than that which it is now permitted to occupy.

Mr. Howe's volume (19) contains some very spirited accounts of colonial adventures, and a capital boy's story called "Harry Delane."

Mr. Vizetelly (20) has added to his already well-known works concerning other wines a volume dealing with port and Madeira, wines which have been somewhat pushed aside by the popularity of all kinds of wines justly or unjustly called "light," but which may possibly have their day again. Mr. Vizetelly's volume is full of interest, and it is the more readable because he does not confine himself strictly to talk about its principal subject. He gives, to take one instance, a general and curious account of the inhabitants of the Alto-Douro district, where the were-wolf of superstition seems still, amongst others, to survive under the name of "lobis-homen." In this part of the world, a few years ago, according to the account of a friend of Mr. Vizetelly's, law and order were in a singularly primitive state, as is shown by a story, the end of which was that the proposed victim of a robber, who was the terror of the neighbourhood, took matters into his own hand, and that no inquiry was made into the sudden death of the ruffian. The book contains a number of spirited illustrations, made chiefly from sketches by Mr. Ernest Vizetelly.

Messrs. Ward and Lock have issued a useful little volume, containing the complete returns of the general election, with biographical notices of the members of the House of Commons (21). Perhaps the sketch of "Six Years of Conservative Government," which precedes this, might as well have been omitted.

The eighth part of Mr. Dalziel's *British Dogs* (22) is especially interesting in containing a warm and well-supported protest against certain common errors concerning the character of the bulldog, a creature which has been apparently maligned with great injustice. Many people will perhaps be "surprised to hear" that the bulldog, if properly treated, is at once one of the most courageous and one of the gentlest and best tempered animals. The author gives an account of one which succeeded a fine Mount St. Bernard in his own house, and proved itself "in every way fully, if not more than, equal to any of its predecessors in endurance, fidelity, and sagacity. . . It has remained always loose in the house, and has, with others of the same breed, daily sustained trials which none but a bulldog could endure without 'showing his teeth.'" So true is it that, as the author says, "manners makyth the dog." It must not be forgotten, however, that the common superstition about bulldogs has its practical effect; and it is to be hoped therefore that no one will assume, because Mr. Dalziel has found the true nature of the bulldog to be the reverse of stupid or ferocious, that any strange bulldog can be patted or chaffed with impunity.

Part VI. of the *Practical Fisherman* (23) contains a good deal of interesting information about the salmon, with practical hints as to flies, and so on.

THE OPENING OF PARLIAMENT.

A QUEEN'S Speech, it has been observed, always excites curiosity, and never satisfies it. Even had no semi-official prophecy leaked out concerning the words that were to be put into HER MAJESTY'S mouth on Thursday, it would not have been difficult to forecast them, for the sole point on which any doubt could have been felt related to the attitude of the Cabinet towards Ireland and the Peace Preservation Act. The complete fulfilment of the Treaty of Berlin is to be insisted upon. No abandonment of Afghanistan is announced or proposed; but, on the contrary, the action of the military and civil authorities in India is referred to with something like cordiality, the allusion to the unlucky blunder in the Indian finances is colourless, and it is proclaimed that the object of HER MAJESTY is to secure, not only the independence of Afghanistan, but its friendly relations with her Indian Empire. South African Confederation is strongly recommended, and, with a wise oblivion of polemical language used under circumstances of greater freedom and less responsibility, the supremacy of England over the Transvaal is to be maintained with due concessions of self-government to the Boers and European settlers generally. In home matters, besides Irish measures, a Burials Act is all that can be said to have been positively promised, the renewal of the Ballot Act being almost a measure of routine under existing circumstances. It is true that Bills for compensating occupiers for losses from hares and rabbits, and for settling the vexed question of employers' liability for workmen's accidents, were more or less distinctly promised. But the promise was accompanied by the proviso "as time will permit," and time in a Session which may practically be said to begin in June is exceedingly likely to forbid. In all other respects, the promises of the Speech are sufficiently unexciting. Governments and policies, it would appear, may succeed each other, and yet resemble each other very strikingly.

There was apparently a very strong sense of this on both sides of both Houses during the debates on the Address. The mover in the House of Commons, and the seconder in the House of Lords, were curiously apologetic and deprecatory in their expressions. Mr. GREY expressed his satisfaction at the fact that there was nothing in HER MAJESTY'S gracious Speech which could wound the feelings of anybody; Lord SANDHURST begged the indulgence of noble lords on the other side as to the affairs of Afghanistan. After this, and in face of a declaration of adherence to their own policy and completion of their own beginnings, the leaders of the Opposition could hardly be expected to make a very ferocious onslaught on the mild majority. Perhaps, indeed, their attack was rather sharper than it seemed to be. The remark of Sir STAFFORD NORTHCOTE that he and his friends "were not of opinion that when "a change occurs in the position of a party it is "at liberty to disown the opinions it has expressed," was perhaps as severe a sarcasm as could well have been made upon the QUEEN'S Speech and its contrast to the flaming polemics of the election. Perhaps Lord BEACONSFIELD'S badinage on the coming institutions for Afghanistan was somewhat less in place, except in so far as it drew attention to the singular tendency which the new Government has already exhibited, in the persons of its individual members if not collectively, to expose itself to ridicule. Ridicule, however, is an extra-Parliamentary weapon rather than one which can be constantly used with effect within the walls of the House, and something more than light fencing of this kind will be required to reduce or checkmate an overwhelming majority. Yet Lord BEACONSFIELD has had more experience of his present difficult position than perhaps any other statesman in English history, and he has rarely been wrong in his strategy. He may possibly think that the first thing to do is to hearten and consolidate his own party, and that for this purpose light skirmishing is safer, as well as more effectual, than point-blank charging. Above all, it is to be remembered that the Speech gives hardly any hold to criticism. It begins and continues, if it does not exactly finish, with declarations which would have been as perfectly appropriate in the mouth of Lord CAIRNS as in the mouth of Lord SELBORNE. With regard to the largest and most important proceeding definitely indicated and in process of accomplishment, the mission of Mr. GOSCHEN to Constantinople, criticism is difficult because the exact nature of the mission has been left in the dark. It would appear that the present Government, among the many inheritances they have received from their predecessors, have received also that inability or disinclination to communicate exact information with which they used while in opposition so bitterly to reproach their foes.

The PRIME MINISTER'S speech, except for its studious waving of the olive-branch, cannot be said to have had any particularly salient features. Mr. GLADSTONE indeed spoke handsomely of the SULTAN and his supremacy, as did Lord GRANVILLE with more detail in the Upper House. But the only positive information which either vouchsafed as to the policy of the Government was the announcement, not for the first time, of the stress laid upon the European concert. It appears to Ministers that the separate actions and interests of the different Powers at Constantinople are a main cause of the difficulty of getting Turkey into order—a proposition which in the abstract nobody is likely to deny. Further, it appears that Mr. GLADSTONE'S Government, unlike their predecessors—for, strange to say, there are points of disagreement between them—do not see anything menacing in the state of Europe. It must be supposed that this reassurance comforted all parties except the Irish members, into whose hands, after Mr. GLADSTONE'S speech, the debate fell entirely in the Lower House; while in the Upper it scarcely lasted beyond the dinner hour. Not often has a first night of a Session been less eventful, despite the division which Mr. O'CONNOR POWER provoked. Perhaps, indeed, the most important [illegible] of the evening was one to which Sir STAFFORD NORTHCOTE not unskilfully called attention. This was the singular divergence in tone between the speeches of the mover and seconder of the Address, who, as it happens, represent accurately enough the two sections of the Ministerial party. Mr. ALBERT GREY has the traditional Whig estimate of the importance of foreign policy; Mr. HUGH MASON deprecates meddling with foreign politics in the familiar Radical manner. Mr. GREY is proud of India, and anxious for the maintenance of its strength and dignity; Mr. MASON'S sole reference to that Empire consists in a rather sanguinary hope that somebody may be condignly punished for the late financial blunder. Mr. GREY seemed to think himself sent to Parliament to support the honour of England; Mr. MASON stated almost *totidem verbis* that he had come to support the wishes of Mr. GLADSTONE. The note of discord between the two sections must be allowed to have been promptly and sharply struck.

The action of the Opposition on this occasion, which

seems to have consisted rather in a crossing of swords than a regular fight, may be thought to throw some light on the proceedings of the recent meeting of the Conservative party held on Wednesday at Bridgewater House. The reports published of that meeting show the discrepancies usual in such statements when they deal with private gatherings. It was probable, even before Sir W. H. Dyke's authoritative statement, that not a few of the published accounts were pure inventions. It seems, however, to be agreed that Lord Beaconsfield laid particular stress on the importance of organization, and that Lord Carnarvon announced that his season of temporary retirement from the party was over. The first of these statements is very likely to be true, and another statement, made on usually trustworthy authority, that the late First Lord of the Admiralty has promised to take up the subject of the reorganization of the party generally, is far from improbable. Mr. Smith's ability in this direction is well known, and the boasts of his supporters that he had made Westminster impregnable were verified at the last election. It would be more important to the public generally, though less perhaps to partisans, if there were less discrepancy about the advice given by Lord Beaconsfield as to the conduct of the Opposition. It is extremely probable that he really gave the counsel attributed to him, that every opportunity should be taken of supporting and conciliating the Whig or moderate element in the present Ministerial party, while stoutly resisting any concessions to the Radical element. Such a course, while steering entirely clear of the merely factious opposition which has of late years been too often offered, would supply ample work for the best disciplined and organized party. At the same time it remains to be seen whether Sir Stafford Northcote will be equal to the difficult task of leading such a campaign, a task the difficulty of which consists at least as much in restraining injudiciously eager attack as in selecting the proper occasions for assuming the offensive. Lord Carnarvon's explanation was in all probability correctly reported or divined, and indeed the correctness of the report follows almost as a corollary from his presence at the meeting. During the long and somewhat trying interval which has elapsed between his quitting the Government and his rejoining the Opposition Lord Carnarvon has behaved with exemplary propriety, both in the House of Lords and in reference to the late election, and his reconciliation with his party need be in no sense a hollow one. His position as a dissident was at least logical, which is more than can be said for his companion in the original secession; and his return has shown that the reason alleged for that secession was a reason, and not merely an excuse.

IRELAND IN PARLIAMENT.

THERE was a dramatic propriety in the part taken by the Duke of Marlborough on Thursday. He had been selected by Lord Beaconsfield as the vehicle through which the news of the dissolution should be conveyed to an unsuspecting electorate, and he had been selected because the Irish policy of the late Government was supposed to be one of their most promising titles to the confidence of the country. On the first night of the new Parliament the Duke of Marlborough is once more picked out for a representative purpose. This time, however, he appears as the mouthpiece of an Opposition charged with the duty of criticizing an Irish policy in favour of which he and his chiefs have been formally displaced. It is possible that, had there been no change of Government, the late Cabinet would themselves have ventured on the experiment now about to be tried by their successors. They are clearly within their right, however, in pointing out the risks of that experiment when it is tried by others. The division of labour between a Government and an Opposition allots to the latter the function of stating openly the objections to a given policy which the Government have considered in private. Opposition criticism is often not so much an assertion that a different course ought to have been adopted as an enumeration of the difficulties which lie in the way of the course actually pursued. The Duke of Marlborough was perfectly justified in throwing upon the Government the whole responsibility of their determination not to ask Parliament to renew the Peace Preservation Act. But he was scarcely reasonable in demanding from them a full and explicit statement of the grounds upon which they had come to that conclusion. When a Government proposes to deal with any part of the United Kingdom in a novel, exceptional, or temporary manner, it is bound to put Parliament in possession of its reasons. If, after such novel or exceptional legislation has been assented to for a fixed time, Ministers are of opinion that it ought to be renewed for a further period, they are equally bound to justify their resolution by evidence. But the fact that an Act of Parliament is made to expire by lapse of time relieves the Government of any obligation to take Parliament into their confidence, if they have made up their minds not to renew it. When the Peace Preservation Act comes to an end, things will only return to their natural course. The Cabinet will be responsible for the consequences of leaving them to take their natural course; but it is not bound to explain why it proposes to do so. It is enough that it does not see any adequate ground for again giving them an exceptional direction. In a matter of this kind a Government can only be judged by results. There are two considerations which would justify the decision now made by the Cabinet—a conviction that the state of Ireland is not exceptionally disordered, or a conviction that they will be able to deal even with exceptional disorders by the weapons with which they are armed by laws common to the three Kingdoms. Mr. Forster tells us that on one or both of these grounds the Government are content to let the Peace Preservation Act go. They have ample cause for wishing to be accurate in their diagnosis of the condition of Ireland; and, until facts prove that they have been mistaken, they must be credited with a better knowledge alike of the force which they can wield and of the need which may arise for wielding it than can be possessed by any one else.

Mr. O'Connor Power showed an almost superfluous desire to convince the House of Commons that he belonged to neither of the great parties in the State. It is with the view, it seems, of conveying this impression that he sits on the Opposition benches. As there happens to be more room on that side of the House than on the other, no one need complain of the course he has seen fit to adopt. Had he thought it his duty to place himself on benches which were already overcrowded, he might have been asked to believe that the House of Commons would fully recognize his independence of ordinary party ties, no matter where his seat might happen to be. It is pleasing to learn that Mr. O'Connor Power is not opposed to the fulfilment of contracts "as a general principle." Some of the speeches made in Ireland during the autumn rather went to show that the independent Irish party held the fulfilment of contracts to be an English eccentricity, the extension of which to Ireland ought to be resisted by every real patriot. If the existing contracts between landlords and tenants include the payment of rent, there is not the least fear that the observance of them will be pushed to an unhealthy extreme. Perhaps, however, Mr. O'Connor Power's language ought not to be interpreted very strictly. A gentleman who can describe the Land Act of 1870 as a piece of hand-to-mouth legislation, resorted to to relieve the inconvenience of the hour, must be accustomed to use words in very different senses from those ordinarily applied to them. With some inconsistency Mr. O'Connor Power finds fault with the Government for not dealing with the Irish land question in a manner which might justly have been called hand-to-mouth. He declared, on the one hand, that neither the Burials Bill, nor the Irish Franchise Bill, nor the Employers' Liability Bill approaches in importance the question of landlord and tenant in Ireland; while, on the other hand, he complains that the Government, after being twenty days in office and with little more than two months of the Session before them, have preferred to deal comprehensively with these comparatively easy matters rather than to touch the fringe of the larger and more difficult matter. The greater the importance of a subject is, the more need there is for inquiry and consideration before dealing with it. This is not the view of the forty-seven Irish members who voted with Mr. O'Connor Power. It may, however, be suggested in their defence that their real object was not to censure the Government for not bringing in an Irish Land Bill this Session, but simply to censure the Government. Possibly, if such a measure had been announced in the Queen's Speech, Mr. O'Connor Power would have moved an amendment condemning the indecent precipitation with which the Government had taken in hand a question which demanded years of the most anxious investigation.

Mr. O'Connor Power's colleagues seem to have been

anxious to modify the impression left by his speech. They meant to vote for his amendment, but they did not wish that amendment to be thought so unreasonable as it really was. Mr. M'Carthy and Mr. Moore assured the Government that they had not expected the land question to be settled this Session, and they did not even maintain that the Government ought to have introduced a Bill purporting to settle it. They would have been content if the subject had been mentioned in the Queen's Speech, and if an assurance had been given that it would be dealt with in some future Session. In Mr. Shaw's speech the meaning of the amendment underwent still further evaporation. He declared that he should vote for it, not because he distrusted the intentions of the Government, or thought that they ought to have either done or said anything different from what they have done or said, but merely to put on record the opinion that the sooner something was done the better. In that sense the amendment became exceedingly harmless. Nothing could be worse for Ireland than that the intentions of the Government with respect to the land question should needlessly remain uncertain for a moment, except that they should be disclosed before there has been time to give them the study without which it is impossible that they should wear any useful shape. Mr. Forster is plainly right when he says that it would be impossible to deal with a part of the land question without prejudging the rest. The suggestion that a Bill might have been introduced to suspend eviction for two years would be an absurd one if it did not come from a party which is bent upon abolishing evictions altogether. The difficulty of dealing with the tenure of land in Ireland is a difficulty rather of principle than of detail. The questions raised by it relate to such fundamental controversies as the limits of private property in land, and the right of the State to narrow those limits in the case of a particular class for the supposed benefit of the community. Mr. Forster's speech is a sufficient assurance that the Government do not underrate either the magnitude or the difficulty of the problems which await them. To have treated them in the way suggested by the Irish members would have argued a very inadequate conception of their task. Even Mr. Parnell acknowledges that premature legislation on the land question is to be deprecated. He only desires that the Government should prematurely pledge themselves to give this legislation a particular character.

ADVANCED LIBERALISM.

In entering that new world of journalism which is the old, the *St. James's Gazette* will not encounter the difficulty of forming the tastes and habits of thought which it proposes to satisfy. Even hostile critics will admit that the *Pall Mall Gazette*, as it lately existed, had a special character of its own. The conductor and his associates, if they sometimes approached to paradox, were original, independent, and apparently sincere. The appropriation of the familiar type and form to the purposes of a thorough-going party paper may probably be quite legitimate, and, as a private matter, the transaction is not liable to discussion; but the change must have disturbed many associations. After the dissolution which has occurred, the visible body may perhaps be reanimated to new and vigorous life, but the identity clings to the spirit which is about to assume another corporeal form. Nearly five-and-twenty years ago the founders of the *Saturday Review* appealed for the first time professedly and exclusively to an educated audience; and the success of the experiment produced many followers. They have perhaps not always been conscious of their obligation; but the habitual disuse of some popular formulas and fallacies must have been a relief to scrupulous writers and to fastidious readers. The patience which is thought to be meritorious in the more sensitive members of a mixed congregation is unnecessarily tried when trained intellects are addressed in published phrases adapted to the supposed capacity of the multitude. The new or revived journal must be strangely affected by a mere alteration of name if it condescends to the methods which distinguish the accomplices of demagogues from the advisers or critics of statesmen. The prospectus contains a recognition of the possible utility of party journalism, but the paper is intended to occupy a different province. It is difficult to exercise independent judgment and at the same time to keep step with disciplined battalions of partisans.

On one point, or rather in one main department of political controversy, the promoters of the new journal defy the imputation of vacillation or inconsistency. Their scepticism or toleration has in one direction a permanent limit. "These later years have witnessed a new growth "of Radical doctrine which is to English politics what the "American weed is to English rivers." The comparison is not perhaps perfectly felicitous, for the American weed chokes the flow of the stream which Radical agitation would swell to a torrent; but the denunciation of dangerous theories is not confined to figurative language. 'The tyrannical temper of this school; their strange 'sympathy with despotism; their international policy, which appears to be drawn from Don Quixote and the Crusades; their Communistic economy; their readiness to experimentalize in irrevocable legislation of the gravest order, mark them off as a new and dangerous party in English politics; and to this school of Radicalism we shall offer at all times a vigorous and determined opposition." In some instances the various opinions and tendencies of the advanced Liberal school are perhaps merely connected by a casual and temporary bond of union. It was only through passionate antagonism to his political opponents that Mr. Bright two or three years ago taunted the late Government with their failure to follow the precedent of the Crusades. The Peace Association cannot be considered to be followers of Don Quixote; and the sympathy of the ultra-Liberal party, though it is not repelled by despotism, only attends a particular despot who may have happened to pursue objects common to themselves. If a Republican Government had invaded Turkey, the party would probably have preferred a conquering democracy even to an ambitious military despotism. The ecclesiastical impulses which have so oddly combined themselves with the Liberal movement depend on a purely casual coincidence. The most dangerous characteristic of the international policy of advanced Liberals is an indifference to legal right and to established possession. The stress which is laid in modern controversy on ethnological and philological affinities indicates a revolutionary temper which is in a high degree unjust and capricious. The highest in rank and first in ability of advanced Liberals has chosen to constitute himself the patron and advocate of the Slavonic races and the adversary of the Magyars, who are said by ethnologists to be akin to the Turks. Thirty years ago the Hungarians were, with better reason, more popular among English democrats than any other race in Eastern Europe. The dynastic rules by which the Congress of Vienna readjusted territorial arrangements were not more arbitrary than the sympathies of modern Radicals, and they were less practically mischievous.

The charge made against the same party of tampering with communistic economy is not unfounded. In almost every recent discourse or essay on subjects connected with the land, the right of the Legislature to disturb and regulate the conditions of ownership is either urged or taken for granted; yet the actual state of society rests on the assumption that property is an ultimate fact. Some theorists deduce from the primitive relations of Indian cultivators to the soil the startling inference that absolute ownership of land is impossible or inadmissible. A larger class of projectors desire to restrain as far as possible freedom of contract between owners and occupiers, not only for the benefit of the less aristocratic class, but on the novel pretext that the community at large is interested in the encouragement of production. The most extravagant of recent English attacks on the whole principle of ownership was contained in one of the famous Midlothian speeches. On the hypothesis that he had been already converted, as he may perhaps be converted hereafter, to an erroneous conviction which he at the same time disclaimed, the present Prime Minister declared that Parliament would be justified in expropriating every landowner in the kingdom with pecuniary compensation. Even if legislation of this kind is expedient or defensible, it is undoubtedly communistic. At its outset the new economy ought to be subjected to vigilant and even to hostile criticism. It is highly inexpedient that organic changes should be introduced without notice or examination. One result of a distribution of landed property which is almost peculiar to England is that projects of unsettling proprietors' rights are almost exclusively applied to the land. On the Continent, where landowners are more numerous, and therefore

less enviable and more formidable, socialistic agitation is more commonly directed against capitalists and owners of personalty. English bankers and manufacturers may be well assured that expropriation will not be confined to owners of land. The conversion from extreme Liberal opinions of those who have anything to lose proceeds perhaps with sufficient expedition; but it may be advantageously regulated, instructed, and, if necessary, checked. Blind and indiscriminate resistance is as objectionable as precipitate complicity with change.

The leaders of the advanced Liberal party are perhaps well advised in preferring to all other objects the increase and consolidation of their own power. Means are anterior in time to the ends which they are designed to accomplish. The present supremacy of the Liberal party results from the victory of the numerical majority in the constituencies over the upper middle classes; but a reaction might possibly take place, as in 1874, unless the side which is now the stronger receives additional reinforcements. The loss of three seats, or of six votes on a division, before Parliament has met for business, may perhaps disturb the confidence of the victors at the general election. The abolition of the electoral influence of property by the proposed change in the county franchise will insure and perpetuate the preponderance, not perhaps of the present Liberals, but of the party which will succeed to the title. Support given to the extension of household suffrage by the professed opponent of advanced Liberalism would have involved flagrant inconsistency. The advocacy of the system of foreign policy which is represented by the present Ministry, or rather by the late Opposition, would scarcely have involved a more total abandonment of opinion and principle. It appears from a published statement that a third condition of modern Liberalism is the disestablishment of the Church, though the measure forms no part of the imperative mandate which is, as it seems, imposed on the present Parliament by the constituencies. Independently of other reasons, the friends of social order and of culture and the opponents of vulgar fanaticism will almost unanimously, though perhaps without ultimate success, oppose a change which can produce no conceivable benefit to the community in compensation for the enormous evil which it would involve. The most active promoters of abolition would find that their own social position was not raised, although their envied rivals might be brought nearer to their own level. When disestablishment becomes an immediate political issue, there will almost certainly be a secession from the Liberal ranks; but the constituencies of the new electoral districts may possibly not share the conscientious scruples of the best of the present leaders of the party. Independence of popular ignorance and caprice may become rarer and rarer in the House of Commons, but it may perhaps survive in the more intelligent and conscientious portion of the press. It is something to prove that a party which cannot be effectually resisted is nevertheless in the wrong.

EGYPT.

IN many important respects the present state of things in Egypt is brighter and more promising than any that has been known in recent years. The new KHEDIVE has just been making a tour through his provinces, and has not only learnt much that the reigning prince ought to know, but has inspired a very favourable opinion of his character and intentions. He is amiable, well-meaning, strictly economical, and hates with a thorough and creditable detestation the intrigues and manœuvres in which his father found the only atmosphere in which he could breathe freely. RIAZ PASHA, the present Chief Minister, is anxious to do justice to the claims of foreigners, and to walk as strictly as an Egyptian Pasha can walk in the paths of uprightness and loyalty. Foreign capital is flowing freely, perhaps too freely, into Egypt, and the peasantry have ceased to suffer from gross tyranny and from the burden of capricious and unforeseen taxation. With the consent of the Great Powers, a Commission of Liquidation is sitting with authority to settle definitely the whole financial situation of the country. It will lay down once for all what creditors of each class are to receive, and how what they are to receive shall be paid to them. To the conclusions of this Commission, which will be binding from the outset on the Powers represented on the Commission—that is, England, France, Italy, Germany, and Austria—the assent of the minor or less interested Powers will be asked, and, their assent being obtained, the edict of the Commission will have the force of law, and will be enforced by the International Tribunals. There is complete peace and security through the country, and the late Viceroy has left behind him many memories, but no regrets. For the moment, too, England and France are working together in perfect harmony; and they are not only agreed on the general principles of action, but even in details discountenance as much as possible the rivalries of their agents. When all these things are added together—an honest and well-meaning Sovereign, the smooth working of the Protectorate, a termination to be expected in a few weeks of the financial puzzles and controversies of the country, a peasantry which has reason to think itself better off and better treated than in former days, and a disposition verging on a mania on the part of foreigners to pour in endless capital for the development of Egyptian industry—it might seem as if the prospects of Egypt ought to be looked on as very bright indeed. And there really are many unquestionable signs that Egypt has turned the corner, and is on the road to a fair amount of prosperity. But in England there is always a tendency to exaggerate the good or bad that may be said of a foreign country; and just now Egypt seems to be the fancy of the hour, and people speak as if all the difficulties of Egypt had been surmounted, and as if there was nothing but blue in the Egyptian sky.

For the moment it is the settlement of Egyptian finance that is of primary importance. The ROTHSCHILD loan lies outside the sphere of the Commission of Liquidation. It is guarded by a law of its own, and its guarantees are already sanctioned by the Powers. Certainly it is as well protected as anything in the way of an Egyptian loan can be protected. Its primary security consists in the revenues of a considerable tract of land administered by a Board, the European members of which cannot be removed without the sanction of England or France, according to their respective nationality. The Egyptian Government guarantees five per cent., and to make this guarantee sure, it is in the first place stipulated that a large part of the taxes on the land are not to be paid until the five per cent. interest is covered, and then the whole revenues of a province are to be set aside until it is known that they are not needed to make the Government guarantees good. Every other portion of Egyptian indebtedness falls within the scope of the Commission. The debts of the Dairas, as well as the debts of the State, are to be dealt with by it. Obviously the beginning of any arrangement for paying the interest and sinking fund of debts must be to ascertain what are the real resources of the debtor. After much careful and prolonged investigation, those charged with the task of examination have ascertained that the clear revenues of Egypt on an average of years do not exceed eight millions sterling. At least half of the financial troubles of Egypt have come from the exaggerated estimate of these revenues which the late Khedive constantly put forward. He always made himself out to be richer than he was, and his creditors naturally said that if he could pay he must be made to pay. Now they must accept facts, and abate their hopes and pretensions in proportion to an acknowledged shortcoming of income. But a new complication has been recently introduced. Some years ago the Khedive offered to landowners the power of buying up one-half of their land tax by the payment of sums supposed to represent the capitalization of this half, the amount being paid either in one payment or by instalments. Very considerable sums have been paid in this way, and it is by this means that the capital of what are known as the short loans has been nearly paid off. If this law of redemption had been allowed to continue in operation, the time would soon have come when the land revenue of Egypt would have been seriously reduced. There would not have been eight millions to deal with, and therefore the Government of the new KHEDIVE, under the pressure of its European advisers, has by a stroke of the pen declared that the whole system shall be totally inoperative. The land tax shall not be considered to have been redeemed at all. Many arguments are put forward to show that this is not so iniquitous as it seems. It is said that the redemption was only a cloak for a forced loan, and that those who paid knew from the beginning that the KHEDIVE was robbing them. It is further said that the KHEDIVE himself and many

of his rich dependents or favourites never really paid, but got receipts that looked quite satisfactory, though they were in fact mere official hoaxes. Lastly, it is asserted that even those who really paid were in most instances only able to do so by abstaining from the payment of their current taxation, so that on a balance of accounts they owe the State as much as they are owed. But it is impossible to believe that these allegations, although they may apply to many cases, apply to all. Many millions sterling have been paid in for redemption, and there must have been many of the contributors who did not know that they were being robbed under the cover of a forced loan, who got receipts for money actually paid, and who paid their current taxes while they were making what seemed to them a legitimate investment. It is monstrous that such persons, whether they are few or many, shall receive no compensation, and either the Commission of Liquidation will have to provide them compensation, or these claims must be left outstanding, to be met in the course of time when the revenue of Egypt exceeds eight millions. If the first course is taken, a new inroad is made on the scanty fund which the Commission has at its command. If the second course is taken, the future increase of income is anticipated, and foreign creditors cannot hope that, as years roll on, they will get more than can now be given them.

Even apart from the compensation to be given to those who have honestly paid their redemption money, the fund that can be applied to the settlement of the claims of the creditors is a scanty one. In various ways and degrees the creditors must make sacrifices—that is, they must be content to take less than they were promised in the days when the KHEDIVE exaggerated his resources. On the other hand, they will know what they are to get, and will have a reasonable prospect of getting it, and they will probably prefer a small certainty to a larger uncertainty. But wise men will not reckon on anything in Egypt as absolutely certain. Egypt is not really at all a rich country. Its cultivated area is only about the size of Wales. The land tax eats up a third of the produce, and cultivation is necessarily costly. Everything depends on the Nile, and the Nile is capricious in the bestowal of its benefits, being sometimes too high and sometimes too low; and even when at its best it needs to be most carefully managed. It has to be taken on to the land, and then it has to be taken off. When it is said that Egyptian produce depends on the Nile, what is meant is that it depends on the construction and conservation of vast works of embankment, irrigation, and drainage. Egypt is a country where, to get anything, capital must be sunk, and where on the capital sunk not more than moderate returns are to be expected. Foreign capitalists, too, labour under the disadvantage that the feeling of a large and influential portion of the natives is strongly against them. At present this feeling is forced into the background because the political pressure of France and England is now strong. But no one can say how long this pressure will last. When the affairs of Egypt have been once more put in order by the Commission of Liquidation, when it is once settled how much Egypt is to pay to its foreign creditors, then, so long as the stipulated sum is regularly paid, the Egyptian Government will certainly claim to be left alone, and it is not easy to see on what grounds this claim can be resisted. Englishmen know their own Government well enough to be sure that it will seek any opportunity of terminating an interference which it cannot prove to be necessary. If Egypt is left to itself, subject to the liability of having to pay a fixed sum to its creditors, all the old habits of Egyptian government will be gradually resumed. Already politicians of the old school are triumphing in the thought of the good time that is in store for them, and are weaving the schemes that are to be carried out as soon as the hour for carrying them out has struck. They look forward eagerly to the time when foreign capitalists may be safely denied justice, or may be made to pay for getting it. Nothing is certain in Egypt; but it is at least as likely as not that these expectations will be fulfilled. The only permanent channel through which European influence may be safely expected to make itself felt is that of the International Tribunals; and the one great work which remains for the protecting Powers to do is to perpetuate and consolidate the authority of these Tribunals, and so to recast the law they administer that it may suffice to meet the various requirements of a solid and permanent system. But it must be remembered that in a country like Egypt law does not cover the whole of life. There will always be promises which the Government will make and which tribunals cannot enforce, and annoyances which the Government will cause and which tribunals cannot prevent.

THE HOME-RULE LEADERSHIP.

SOME of the Irish members who lately took part in the contest between Mr. SHAW and Mr. PARNELL avowed an ignorance which may therefore without discredit be confessed by aliens and strangers, of the functions of a Sessional Chairman. The title was first invented by Mr. PARNELL for the purpose of repudiating the claim of Mr. SHAW to the rank of Home Rule leader, in which he was supposed to have succeeded Mr. BUTT. Any body of members which thinks itself strong enough and sufficiently distinctive in character to form a party requires a representative or leader who is entitled to speak in its name. Mr. BUTT's right to the lead was not formally disputed, although his authority was sometimes defied by mutinous followers. He had been the first incumbent of the office in days when Mr. PARNELL was unknown, if indeed he had then a seat in the House of Commons. On his death Mr. SHAW was thought by the majority of the party to be qualified for the succession by respectability, prudence, and a moderation of language which was not incompatible with occasional deference to popular clamour. No competitor opposed his pretensions; but perhaps Mr. PARNELL may have determined to set Mr. SHAW aside as soon as he had himself acquired sufficient notoriety to enable him to assert his independence. In concert with Mr. BIGGAR and half-a-dozen congenial allies of the same type, Mr. PARNELL engaged in a conspiracy against freedom of debate; and he proved that Parliamentary institutions might be seriously threatened by a novel mode of attack against which no precaution had been taken. Obstruction had little tendency to promote Home Rule; but there were members of the party who preferred the infliction on the House of Commons of trouble and annoyance to the attainment of an object which they perhaps knew to be impracticable. Mr. PARNELL and his associates necessarily became more conspicuous than Mr. SHAW, whose refusal to take part in obstruction was resented by the denial of his pretensions to the character of a leader. When Mr. PARNELL stigmatized Mr. SHAW as a mere Sessional Chairman, he can scarcely have foreseen that he would himself become a candidate for the humbler office. The importance of every position depends more on the person who holds it than on the term by which it may be described. Mr. PARNELL as Sessional Chairman will be a leader of the BIGGARS and FINIGANS, though his rights may be limited to the occupation of the chair at meetings of Home Rule members, if they can be persuaded to meet. He is perhaps sagacious enough to calculate on the concurrence in violent proposals of many of the members who resent his assumption of superiority. Almost all of them have at different times professed to favour projects of spoliation which differ but little from Mr. PARNELL's socialist doctrines. If the Home Rule party has any leader, it follows its new Sessional Chairman.

The minority as well as the majority at the late meeting has virtually identified itself with the policy of Mr. PARNELL. All who voted must have pledged themselves to abide by the result, and to have previously waived any disqualification which might affect the successful candidate. Mr. PARNELL's advocacy of general refusal of debts due to landlords is declared to be not incompatible with his honorary presidency of the party which takes its name from Home Rule. Some of his followers may perhaps not fully understand the process by which Mr. PARNELL has partially succeeded. No demagogue has profited so consistently by the embarrassment felt in contending with an opponent who declines to be bound by the rules of the game. Parliamentary government is only possible on the condition that all who administer the system shall act in good faith. The obstructionists deliberately took advantage of forms intended to protect minorities for the purpose of rendering the transaction of business impossible. Encouraged by his success in hampering legislation and in irritating the House of Commons, Mr. PARNELL after the close of the last Session proceeded to apply his theory to social relations which, like Parliamentary rules of debate, depend on certain fundamental

principles or unquestioned assumptions. If law and custom have any validity, payment of debts and performance of contracts are necessary deductions from the most elementary maxims; but Mr. PARNELL had no hesitation in assailing the very foundation of proprietary right. He has again and again assured malcontent peasants that they are justified in refusing to pay the stipulated rent; and he and his disciples have denounced, under the name of landlordism, all ownership of land which may have been let to occupiers. If it had been necessary for his political purpose, he would probably not have hesitated to propose the plunder of other creditors whose rights are not more sacred than those of landlords; but nothing is to be gained by the encouragement of unprofitable crime. It would not have suited the purpose of the agitator to alarm and alienate the tradesmen in the towns who may have claims on the tenant farmers. As might be expected, some of Mr. PARNELL's adherents caricature his contempt for morality. His principal lieutenant lately intimated at a public meeting a hope that some HARTMANN would be found to assassinate the QUEEN.

It would be idle to argue against doctrines which have nothing in common with the principles of civilized society. Those who sympathize with Mr. PARNELL are inaccessible to ordinary reasoning; but it may be worth while to ascertain the methods by which anarchical demagogues seek to accomplish their designs. The Home Rule party has now placed at its head, though in an indefinite position, the avowed enemy of landed property and of the connexion of Ireland with England. It has at the same time decided that the most effectual mode of promoting its purposes is to place the Government in the hands of one of the two great English parties. In Ireland, indeed, Mr. PARNELL naturally preferred candidates of his own opinions to Liberals, as well as to Conservatives; but in English towns the Home Rule agitators threw the whole of their not inconsiderable weight into the scale of the Liberal party. They had shortly before learned from Lord RAMSAY's miscarriage at Liverpool that they ran the risk of injuring rather than of assisting allies who pledged themselves to Home Rule, or to the equivalent test of Home Rule inquiry. Accordingly, the managers in England were instructed at the general election to abstain from negotiation, and to give the Irish vote in every case to the Liberal party, which in their judgment was most likely to promote the interests of Home Rule. In Southwark and other boroughs Mr. SULLIVAN and other partisans of Mr. PARNELL addressed Irish meetings for the purpose of urging the claims of the Liberal candidates. Although there are no statistical returns in which the Irish votes in English boroughs are distinguished, there can be no doubt that the present Government owes a considerable part of its majority to the unanimous adhesion of the Home Rule League and the Land League. Under pretext of resenting the language of Lord BEACONSFIELD, the Irish agitators used their utmost exertions to defeat the party which was supposed to be bent on maintaining the rights of property and the unity of the kingdom. There were probably not many Home Rule voters at Oxford, at Sandwich, or in Wigtonshire.

The Government may perhaps not regard with unqualified satisfaction the one-sided alliance which has been thrust on it by Mr. PARNELL and his party. In dealing with the most urgent of the questions which it has to decide, the Ministers have probably not been influenced by any feeling of gratitude for electoral support. Mr. FORSTER, who is primarily responsible for the abandonment of the Coercion Acts, may be trusted to consult to the best of his judgment the public interest and security. It is asserted that the late Government had intended not to renew the Acts which will now be allowed to expire. The Liberal Cabinet will be entitled to the credit of consistency, and it will be rewarded with immediate popularity among its own supporters. That it will incur grave responsibility probably none of its members will deny. The very name of coercion is invidious; and sanguine politicians too readily forget that the peaceable portion of the community may be systematically coerced by those who are no longer to be restrained by law. If a repeal of the existing Acts should be followed by a reign of terror, the result of lenity will not be unprecedented. There are some objections to coercion, and there is also much cant on the subject. Many writers and speakers have lately quoted CAVOUR's famous remark that anybody can govern with a state of siege. It by no means follows that it is better not to govern at all than to govern with a state of siege. CAVOUR's phrase implied his confidence that he could govern by ordinary methods. If the English Government is justified in entertaining the same conviction, it is undoubtedly right in dispensing with coercion, which nevertheless has nothing in common with a state of siege. In the proclaimed counties offenders are tried by the ordinary tribunals, instead of being shot, as in a state of siege, by order of court-martial. The most effective provisions of the Coercion Acts relate to the possession of arms, which are probably procured and used for purposes either of insurrection or of assassination. To ordinary minds there is nothing extraordinarily shocking in legal precautions against murder and civil war. The promise of benevolent measures which are to take the place of Coercion Acts is utterly fallacious. No concession ever made to Ireland has sufficed to produce contentment and peace. If the proposed boons are really beneficial, they ought to be granted; but they will assuredly not conciliate Mr. PARNELL and his followers. If the Government can really devise any mode of improving the condition of Ireland, the means by which the object may be attained will not be harshly criticized.

THE ITALIAN ELECTIONS.

FOR the past four years the confusion of Italian politics has been daily growing worse confounded. In March of that year, as will be remembered, the Government of the Right—or, as we should call it, of the Moderate Liberals—was upset by a coalition of discontented members of the party with the whole body of the Left. In the use of the terms "Right" and "Left" we must beware, however, of being misled by the analogies of French politics. The Clerical and reactionary party which constitutes the Right in France has in Italy, ever since the formation of the kingdom, deliberately kept aloof from public life. It has done so at the bidding and in the supposed interests of the Vatican. The Italian Chamber, therefore, may be said to have consisted entirely of Liberals of various shades. The difference between the moderate men of the two parties is imperceptible. The healthy working, however, of Parliamentary government in any country demands as its condition that the distinction between parties should be real and not merely nominal; and this is especially the case in Italy, which is new to a free public life, and the past history of which has especially fostered those qualities in the national character which tend to make politics a matter of intrigue rather than of conviction. As long as the POPE and the Austrians ruled in Italy there was an object, superior to all party distinctions, which Liberals of every shade could strive after in common; and if the Clerical party were to attempt to undo the work of Italian unity, such an object would again be set before them. But, as matters stand, there is no use in blinking the fact that, ever since the unity of Italy was accomplished, Parliamentary government in that country has been growing more and more meaningless and futile.

In the spring of 1876 the long rule of the Right—a rule which had lasted, with two brief interruptions, ever since the formation of the kingdom—came to an end, and the Left entered into office. In the autumn of the same year a dissolution of the Chamber took place, and the fresh elections gave the new Government an enormous majority. Enormous majorities, however, do not always render the task of government more easy. In Italy during the past four years this has assuredly not been the case. During this period there have been not less than six different Administrations, all belonging to the Left, and there have been crises, independent of the rise and fall of Cabinets, which it would be difficult to number. First came Signor DEPRETIS with Signor NICOTERA as Minister of the Interior; then a crisis and a new Cabinet headed by Signor DEPRETIS without Signor NICOTERA, but with Signor CRISPI; then another crisis and the Ministry of CAIROLI; then a crisis without a change of Prime Minister; then DEPRETIS again; then CAIROLI again; then, last autumn, an acute and prolonged crisis, which ended in the reconciliation of CAIROLI and DEPRETIS, and the formation of a new Ministry which included them both. But outside this Cabinet were

three of the ablest and most influential members of the Left—Signor Nicotera, Signor Crispi, and Signor Zanardelli—each with his group of followers; and these, the so-called Dissidents of the Left, have for some months been waging against the Government a much more bitter, if less open, war than that carried on against it by its avowed opponents of the Right. A month or two ago matters came to a point; and on the question of the foreign policy of the Government a vote of confidence, more apparent than real, was obtained from the Chamber. Shortly afterwards the artificial majority thus brought together was again dissolved, and the Chamber accepted the Report of the Budget Commission, which, while granting to the Government a provisional credit, added a rider to the effect that greater promptitude on the part of the Ministry in preparing the Estimates was desirable. Hence a new crisis, and the present elections.

The four years during which the late Parliament has sat have been fruitless in useful legislation. The partial repeal of the Grist-tax—a measure, in the present state of Italian finance, of questionable prudence—is its one exploit. The pressing questions for Italy, those of social and administrative reorganization, have been left to take care of themselves. Municipalities either already bankrupt or hurrying fast towards bankruptcy; an agricultural population living, in the greater part of the country, in a state of destitution and misery painful to witness; a deplorable ignorance among the mass of the people; an amount of crime, and that of the most atrocious character, greater by far than in any other civilized country of Europe; a perversion of the popular conscience which regards the assassin, and not his victim, as an object of sympathy and pity—these are some of the evils which might fairly claim the attention of an Italian Parliament, and which legislation can assuredly do a great deal, though not everything, and not all at once, to cure. But, instead of doing something to make the law respected, to render life and property secure, to diffuse education, to protect the masses of the people from the systematic oppression under which, especially in the Southern provinces, they suffer at the hands of the ruling classes, the late Parliament has been occupied solely with the question whether Depretis or Cairoli, Nicotera or Crispi, Zanardelli or Grimaldi, should enjoy the pleasure and distinction of holding a portfolio. To describe the last four years of Italian Parliamentary history as a period of utterly futile and barren legislation is only to echo the almost unanimous judgment of the Italian press. The blame of all this is apportioned according to the political opinions of the individual writer; but men of all parties agree as to the fact. For four years the Left has been in power with an unprecedented majority, and it has done simply nothing. Each section of it declares that the fault lies with another section; but all admit the fault, and agree that the annals of the defunct Parliament do not form a creditable chapter in Italian history.

The result of the new elections, which the supplementary elections of to-morrow are not likely materially to alter, gives the present Government a majority. Whether it will have a majority over the Right, combined with the dissidents of the Left, remains to be seen. If not, another crisis, a new Cabinet, and perhaps a fresh dissolution, are what may shortly be expected. Signor Nicotera, Signor Crispi, Signor Zanardelli, and the other disappointed dissidents are not likely to let any favourable occasion slip for upsetting the Ministry. Unfortunately, when it is upset, there is too little reason to suppose that a more stable Administration will take its place. The Right, which contains the best political talent and experience in the country, is still in a minority, though it appears to be stronger and more homogeneous than in the last Chamber. But, without a majority, a Cabinet of the Right could only live on sufferance, and would be incapable of any vigorous or useful legislation. Even if a reconciliation took place between the warring factions of the Left, there is no likelihood of its being permanent. The same causes which have produced so many quarrels and breaches in the past will in all probability be as active in the future. The evil, in fact, is one that is very hard to cure. As long as the mass of the electors are so indifferent both to the political questions put before them and to the personal character of the men who solicit their votes that barely half of them will come to the poll, it can hardly be expected that candidates returned to Parliament will be pre-eminently staunch and zealous. The electors are apathetic; the members of the Chamber are irregular in attendance and indisposed to transact business; and, if it were not for the amusement of making and unmaking Cabinets, the constant frequenters of the Chamber would form a still scantier band than they do at present.

It has been asserted that the Pope was anxious that the Clericals should take part in these elections, and that his wishes were overruled, as they have been on other occasions, by the reactionary party in the Vatican. Nothing certainly would tend more to make Parliamentary life in Italy a reality than the presence of a strong Clerical party in the Chamber. There would then be something to fight about. But at present there is little or no difference of principle between those who sit on different sides of the Chamber. The Republican party in Italy is small, but in earnest; the Clerical party is large, and in earnest. The Republicans, however, accept the monarchy as expressing the will of the majority; and the Clericals still decline either to elect or to be elected. The Liberal party is thus left without its natural opponents, and, in default of these, its various sections make war upon one another. The abstention of the Clericals is doubtless, from the point of view of the Vatican, good policy. The longer they hold back, the more discredited, in all likelihood, will Parliamentary government in Italy become, and the more probable will be the triumph of the Clericals when they at length come forth from their reserve. The policy of the Vatican in this point, as in others, is astute, and it would be useless to complain that it is not patriotic.

THE BLACKBURN STRIKE.

THE end of the Blackburn strike was not unexpected. The reasons which induce the weavers to return to work at the existing rate of wages are so conclusive as to increase the surprise which might be felt at the decision which they have now reversed. Nothing has happened which might not have been foreseen; and the workmen were warned of their inevitable defeat by their own trusted advisers. It is well that work should be resumed, but it would have been better if it had not been interrupted. Some thousands of weavers and spinners have lost a week's wages; and the course of trade in Blackburn, in Oldham, and probably in other districts of Lancashire, has been seriously deranged. The strike, and the lock-out by which it was to be encountered, threatened to check the very slight improvement which had taken place in the cotton manufacture. The immediate cause or pretext of the strike might rather have been expected to have the opposite tendency of encouraging the operatives to rely on the liberality or justice of the masters. In consequence of an increased demand for yarn, the wages of the spinners had been raised five per cent.; while, in default of an improved market for manufactured goods, no similar advance was given to the weavers. It was perhaps to be expected that the less fortunate class of workmen should be disappointed by finding that they had as yet no share in the comparative prosperity of their neighbours; but it might have been expected that the explanations offered would satisfy them that there was no change in the state of trade which could affect their own rate of wages. The statements of the masters appear to have been so conclusive that the leaders of the workmen recommended them to suspend or withdraw their demand. It is also asserted that the great majority of operatives objected to a strike; and yet, at a meeting which seems to have had authority to decide the question, a resolution to discontinue work was unanimously carried. In political controversies public opinion has sometimes been paradoxically defined as the opinion which is held by no private person; but it is surprising that, in a matter of immediate and pressing importance, those who are principally concerned should agree to surrender their judgments to a noisy minority which, as they well know, is not better informed than themselves. Delegates and officers of Trade-Unions are always sufficiently ready to recommend their constituents to strike. Their advice is invariably followed when it tends to a rupture with employers, and it is unfortunate that it should be rejected when it inclines to peaceful courses. The strike appears to have been connected with a movement by which in another part of Lancashire the

weavers have obtained by successive instalments an advance of five per cent. According to some accounts, the body which, like a Birmingham caucus, manages the affairs of a large community determined to transfer their activity to North-East Lancashire, and selected Blackburn as the scene of their operations. There was from the first some doubt whether the strike would be continued. It is the custom in Lancashire to take holiday at Whitsuntide; and it was thought possible that in a few days the weavers might resume work. It was certain that, if they persevered, they would be eventually defeated.

Admirers and flatterers of the operative class are in the habit of celebrating as their most distinctive virtue their alleged devotion to the interests of their own class; but, although it may be true that, feeling and acting in masses, they have little opportunity of exhibiting personal selfishness, they sometimes seem extraordinarily indifferent to the injuries which they inflict on their involuntary partners in strikes. The Blackburn weavers not only coerced the dissentients in their own trade, but, by destroying the local demand for yarn, they also reduced to compulsory idleness the spinners whose industry has its centre at Oldham. The strike might therefore in one sense have attained its object by reducing spinners and weavers to common distress. That it should produce a rise in the wages paid at Blackburn was highly improbable. The masters would scarcely have regretted the intermission of a trade which was already stagnant. They might have even derived advantage or convenience from an occasion of closing their mills for cleaning and repairs; and they were not unwilling to allow a diminution of stocks before they resumed production. Nothing is more galling to malcontent workmen than the consciousness that they are doing good rather than harm to their employers. The habit of trade combination on either side perhaps confers greater advantages on the masters than on the workmen. The ingenious device of stopping labour at selected places, with the purpose of supporting a strike by the aid of contributions from those who remain at work, is now almost invariably baffled by agreements among the masters to cut off the supplies by which alone the strike can be maintained. On this occasion, the masters in the Accrington district resolved to run their mills only three days a week as long as the Blackburn strike continued. Their workmen would consequently have been mulcted to the extent of one-half of their wages, for an act to which they may or may not have been parties. They would scarcely have been able to contribute to the support of the Blackburn weavers, and they cannot have been anxious to prolong a struggle which was highly injurious to themselves. Another resource on which operatives during strikes are accustomed to rely is the credit which is allowed them by the shopkeepers, who suffer heavily by trade disputes. It is stated that many of the debts which were incurred during last year's strike have not been paid, and that the tradesmen were not on the present occasion inclined to incur additional loss. The time of the strike was ill chosen, because a much smaller amount of wages than usual is earned during the Whitsuntide holidays. The men on strike were informed that they must wait for another week before a levy on the trade could begin.

Notwithstanding the accumulated disadvantages with which the workmen began the contest, 30,000 hands were for the time idle, with an enormous weekly sacrifice of wages, and with a depression in trade which is indicated by a fall of 150,000*l.* in the value of the shares in a single manufactory. Trade-Unions have created a kind of fanaticism which makes its votaries independent of calculation, and willing to incur suffering in the vague hope of occasional triumph. The general belief in a return of prosperity, though it has not yet been sufficiently confirmed, had evidently inclined the Lancashire weavers to believe that the time had arrived for dictating to their employers. Their belief that they can obtain increased wages when the market is rising may be well founded; but they have not sufficiently ascertained the facts of the case. As long as the masters are indifferent to an increase of production, they are secure from any pressure which can be applied by the workmen. The partial cessation of work would inevitably have been followed by a total lock-out if it failed to effect its purpose. It is true that, if prices should unexpectedly rise, the masters will concede the required advance of wages; but the same result would in any case have been attained. In a few mills which remain outside the Association of Masters, the owners and workmen agreed to abide by the result of the dispute; and in the meantime the old rate of wages was maintained; but the exceptions were not sufficiently important to affect the chances of the contest. In Oldham alone, out of 8,000,000 spindles, 6,000,000 were standing still; and the Oldham spinners would have been still further injured by a determination on the part of the Blackburn masters to keep their own spindles running, even if their looms were not at work. The produce of Oldham would have been diminished by 4,500,000 lbs. of yarn per week, and the weekly loss of wages was estimated at 15,000*l.* The corresponding figures for the weaving trade of Blackburn are not given in the same form; but the loss would have been severe, and the stoppage of the mills in a great part of Lancashire during three days in the week involves a great difference in production. Like other trade disputes, the temper indicated by the Blackburn strike can scarcely fail to affect the competition of English industry with Continental and American rivals.

The policy of Trade-Unions is often so unintelligible as to suggest to observers who have no practical acquaintance with manufacturing industry a suspicion that there must be some unknown explanation of proceedings which are mysterious, if they are not absurd. The moral as well as the legal right of combination has long since been acknowledged; and it was perhaps superfluous to apply an ethical test to acts which could not be prevented. The temptation to compel the concession of increased wages or other advantages is obviously strong, and perhaps irresistible. If persons in easy circumstances could add ten or fifteen per cent. to their incomes by refusing to pursue their vocations till the increase was granted, they would probably not be disinclined to follow the example of weavers and colliers; but they might perhaps inquire, with more habitual scepticism, whether the promises of agitators and managers were likely to be fulfilled. The value of a few shillings a week to a working-man is greater than that of as many pounds to a comparatively rich tradesman or professional man; but still experience ought to have convinced workmen that strikes fail more often than they succeed. The hardship of exclusion from work and wages is also in this case greater. It is doubtful whether the members of Trade-Unions are amenable to any general opinion except that of their own class. It is extremely difficult to reach them, because the writers and speakers to whom they look for guidance are almost always strongly inclined to share their prejudices or their judgment. In some trades arbitration, though it rests on the insecure basis of a doubtful principle, has often facilitated compromise by rendering it easier for the defeated combatant to give way. In Lancashire the process appears to be not in fashion; or at least it was not suggested in the course of the recent dispute. The masters would probably have refused to abide by a judgment which might compel them to carry on a losing trade. They can have had little doubt that in the late struggle they would prove the stronger.

M. DE FREYCINET AND M. GAMBETTA.

THE establishment of the French Republic has been the disestablishment of French Ministries. As soon as a Cabinet is formed the process of decomposition begins. One Minister after another is found to be impossible, until in the end it is discovered that the Prime Minister himself is the cause of all the confusion, and he is made away with in his turn. M. DE FREYCINET'S Cabinet has now entered upon the first of these stages. It has just shed its Minister of the Interior. M. LEPÈRE'S resignation is an acknowledgment on the part of the Executive of the superior dignity of the Legislature. He has been defeated on a measure specially belonging to his department, and as his chief has not cared to be his companion in misfortune, there has been nothing for M. LEPÈRE to do except to make his bow and go home. So far as the public are concerned, it seems as though every member of the Cabinet might do the same thing without exciting more than a passing emotion. The interest which Frenchmen take in the fortunes of their momentary rulers is akin to that with which a countryman at a fair watches the ascent of a greased pole. It is the falls that really amuse and the falls that he waits to see. No one in

France, except the few who are personally interested in its fate, seems to care whether M. DE FREYCINET'S Ministry lives or dies.

The only element of strength that it possesses is the fact that one of the few who are personally interested in its fate is M. GAMBETTA. The President of the Chamber of Deputies is not a man to give up any object that is dear to him without a struggle, and the continuance of M. DE FREYCINET in office is supposed to be for the moment very dear to him indeed. M. GAMBETTA'S position just now is an exceptional one. He has outstayed one chance, and sees another not yet near enough to be seized. A time has been when he might have led the extreme Republicans to power. A time may come when he will lead the moderate Republicans to power. But at present the extreme Republicans have thrown him over, and the moderate Republicans seem too disorganized, or have too little confidence in M. GAMBETTA, to be either worth his leading or anxious to be led by him. Consequently, M. GAMBETTA is understood to wish above all things to keep things as they are. If M. DE FREYCINET is sent about his business, who is to succeed him? Not a more Conservative Minister; for, though this might very well suit M. GAMBETTA, as preparing the ground for a new Republican reaction of which he might be accepted as the undisputed leader, it would suit none of the factions by whose momentary coalition M. DE FREYCINET'S defeat would have been brought about. Not M. GAMBETTA himself; for in the existing Chamber he could not be sure of a majority, while he might not obtain the consent of the Senate to a hastened dissolution. Not a more Radical Minister than M. GAMBETTA; for to consent to this would be to show himself to his followers as acquiescing in his own exclusion from the Ministerial series. Consequently, as the alternatives to M. DE FREYCINET are, from M. GAMBETTA'S point of view, either inexpedient or impracticable, his wish naturally is to keep M. DE FREYCINET where he is. M. GAMBETTA'S next move, whatever it is, must necessarily be one of supreme importance to himself. He has governed France once, and he can hardly expect to govern it a third time. The success or failure of his ambition must be determined, to all appearance, by the length of time during which he governs France the second time. It is only natural, therefore, that he should wish to enter upon the experiment under the most encouraging conditions; and while the present Chamber lasts the conditions could scarcely be less encouraging. The majority on which M. GAMBETTA would have to depend is a rope of sand. The Government may at any moment be defeated by a combination of hostile extremes. M. GAMBETTA'S policy, where religious questions do not come in, would in all probability be a moderate policy, and as such it would encounter for different reasons the persistent opposition of the Right and the Extreme Left, and not be sure from one day to another of the support of the whole Republican Centre. M. GAMBETTA may fairly be anxious to begin his official career, whether as Minister or as President, with a more practicable Chamber than the present, and in order to do this he must postpone his entrance upon office until after the elections. If it is known that he proposes either to lead the Republican party in the new Chamber, or to govern the Republic as President by means of Ministers who will be as subordinate to him in name as the present Cabinet is in fact, curiosity, if nothing else, will probably secure him an official majority.

The reasons which move M. GAMBETTA to postpone taking office are precisely those which make M. CLÉMENCEAU and his friends desire that he should take office at once. M. CLÉMENCEAU is not of opinion that M. GAMBETTA is a necessity for France. On the contrary, he thinks that France could get along sufficiently well—or very much better—without M. GAMBETTA. At present the surest way to discredit a French politician is to give him an opportunity of showing of what stuff he is made, and this opportunity M. CLÉMENCEAU would like to secure for M. GAMBETTA without loss of time. The Right are completely at one with him upon this point; and, as they are anxious to make a Republican Government impossible, they are always ready to vote against the Ministry which protects M. GAMBETTA from the obligation to take office. If M. DE FREYCINET is overthrown, it is hard to see how M. GAMBETTA can any longer escape this obligation. A more moderate Republican than he would not consent to form a Ministry until M. GAMBETTA had tried his hand at the work. A more advanced Republican than he could not be asked to form one without conveying to the country the idea that M. GAMBETTA had been passed over with his own consent. This is probably the explanation of M. GAMBETTA'S intervention on behalf of the Government the other day. M. DE FREYCINET wished to go to a vote on a clause in the Public Meeting Bill empowering Government agents to dissolve meetings under certain prescribed circumstances. The Chamber showed a disposition to adjourn the debate, and it seemed likely that the Government would be beaten on a division. M. GAMBETTA suggested that the clause should be referred back to the Committee, thus giving the Government time to reconsider the position. The suggestion was accepted, and the time for reconsideration secured, with the result that the clause was remodelled. As it stands, it provides for the presence of a Government agent at public meetings, but does not in express terms give him the right of dissolving a meeting. In this way M. DE FREYCINET was saved, though M. LEPÈRE had to be sacrificed.

Why the existing Chamber should be allowed to die a natural death, instead of being dissolved by M. GRÉVY with the consent of the Senate, is not quite evident. M. GAMBETTA is not likely to command a larger majority in the constituencies than he could command now, and there is always a possibility that the chapter of accidents may have an unforeseen reverse in keeping for him. There is, however, a prejudice in France against dissolutions, arising perhaps in the first instance from the difficulties with which the framers of the existing Constitutions thought fit to surround them, and strengthened by the unpopularity which attended Marshal MACMAHON'S experiment. M. GAMBETTA is also supposed to be meditating a return to the system under which the electors of a whole department voted together, instead of being broken up into arrondissements—a change which would increase the strength of the dominant party for the time being, and thus recommend itself to M. GAMBETTA'S friends because they are the dominant party, and to M. CLÉMENCEAU'S friends because they hope to be so shortly. Thus the question which underlies these recurring misunderstandings between the Chamber and the Cabinet is simply whether M. GAMBETTA can be drawn from his retirement before he himself wishes to leave it. If M. CLÉMENCEAU can manage it, M. DE FREYCINET will be defeated, and M. GAMBETTA forced to succeed him. If M. GAMBETTA can manage it, M. DE FREYCINET will be kept in office until after the elections, when he will naturally make way for the real chief of the Left. The person who is least to be envied in the whole business is M. DE FREYCINET himself.

AUSTRALIAN SECOND CHAMBERS.

THE Australian public is not, it seems, disposed to view Mr. BERRY in quite the same light in which he is held in England. Here he is regarded as a terrible example of the fall which awaits democratic pride. In Australia he is looked upon rather as an example to be followed—followed indeed in moderation and with some regard to circumstances, but still not wholly neglected. New South Wales has suddenly become the scene of a quarrel between the two Chambers, which, when it has had time to mature, may perhaps become as bitter as that which has made Victoria famous. The fact is an undesigned comment on the worthlessness of the most plausible of Mr. BERRY'S suggestions for the reform of the Constitution. It was argued, with some show of reason, that, if the English House of Lords is to be reproduced in a colonial Constitution, care should at least be taken to give the copy a security against abuse similar to that which exists in the original. When a conflict between the House of Lords and the House of Commons has threatened to become too acute, it has been averted, if the occasion seemed important enough to justify recourse to so grave an expedient, by a hint that the Crown has the power of creating peers, and that, unwilling as it would be to use this power unduly, it may be forced to do so by unreasonable persistence on the part of the Upper House. Mr. BERRY'S deduction from this fact was the superiority of a nominee to an elective Second Chamber. If the Governor of Victoria, he argued, had been invested with the power of nominating additional members of Council, he would have been bound to use this power on the advice of his responsible Ministers. The knowledge that the stubbornness of the Upper House might be thus overcome would have prevented the Council from going too far in the direction of resistance to the

popular House. Such resistance could not be effectual, since, in the last resort, the Cabinet, acting through the Government, would always be able to override it. Consequently perseverance in it could only lead to the degradation of the Second Chamber by the addition of a packed majority, and it was assumed that rather than run this risk the Council would bow to necessity and do what the Assembly wished. Unfortunately for Mr. BERRY's reasoning, there is now a deadlock in New South Wales. That fortunate colony enjoys the very blessing which Mr. BERRY was so anxious to bestow upon Victoria. The Council is appointed by the Governor; and, on Mr. BERRY's showing, the members ought to have been too much alarmed at the prospect of being swamped by wholesale nominations to venture upon resisting the Assembly. The result has not borne out Mr. BERRY's anticipations. The Council has actually amended a money Bill. The Assembly has passed a Bill precisely like the original Bill, and sent it up to the Council. The Council has made on the second Bill the identical amendment which it made on the first, and the two Chambers are for the time hopelessly at issue. Of course the Governor can, if he chooses, make sufficient new nominations to bring the Council into accord with the Ministry; but the point to be noticed is that the fear of this course being taken has not had the effect attributed to it. A Council which was compelled to receive an addition to its ranks every time it differed from the popular Chamber could exercise no useful constitutional function. It is the deterrent force of the penalty that is supposed to make it valuable, and in New South Wales we have a Council composed in the main of hardened offenders for whom the prospect has no terrors.

Accordingly the New South Wales Ministry has had to imitate Mr. BERRY, and set to work to reform the Constitution. It is useless to argue that as the Constitution at present stands the Council may not amend money Bills. The Council maintain the contrary, and when two co-ordinate authorities disagree, one contention is as good as another. In this instance it is an additional annoyance to the Government that the Council detected a really weak point in the Bill they amended. The Council thought that a tax which it was proposed to levy on bills might apply to bills already current, but which would not mature until after the Act had come into operation. The Government answered that nothing of the kind had been intended or could fairly be deduced from the words of the Bill. The Council rejoined that this had better be made perfectly clear, and introduced a clause to make it clear. The Government were plainly ill advised in not introducing such a clause themselves; but their dealings with the amended Bill when it returned to the Assembly were still less wise. Holding as they do that the Council has no power to amend money Bills, we find no fault with them for withdrawing the Bill and sending an entirely new Bill up to the Council. But there is no excuse for making this second Bill an exact copy of the first. The principle would have been sufficiently guarded by the refusal of the Assembly to consider the Bill as it came from the Council, while the interests of the community would have been consulted by the introduction of a new clause to guard against the possibility to which the Council had drawn attention. Instead of this, the defect in the original Bill was left unremedied in the substituted Bill, and the Council left to insert their amendment again if they dared. Thus challenged, the Council naturally stood by their clause, and since that time the Government have been busy in passing through the Assembly a Bill to deprive the Council of the power to amend money Bills. When this Bill, which has already been read a second time in the Assembly, comes before the Council, it will no doubt be rejected, and the deadlock, to reach which it seems to be the ambition of all Colonial Legislatures, will thus be secured.

Although at present the New South Wales Government have not gone anything like as far wrong as the Victoria Government, they have committed the very grave error of provoking the Council on a matter in which the Council are plainly in the right. The special function of a Second Chamber is to supplement any omissions and confusions which may have crept into the legislation of the First Chamber. A First Chamber, if it thinks that it has the sole right of framing money Bills, may embody the amendments of the Council in a new Bill of its own, rather than acquiesce in the Council's claim to amend money Bills as other Bills are amended. But the only case that could call for an amendment of the Constitution would be one in which the Council should insist on introducing amendments which the Assembly thought mischievous, and should throw the finances of the colony into confusion rather than consent to the excision of these amendments. Nothing of this kind has happened in New South Wales, and the attempt to amend the Constitution without any such provocation deserves to meet the same fate as that which has lately overtaken Mr. BERRY's similar attempt in Victoria. If a Second Chamber is to have any rights whatever, it cannot profitably be forbidden to make the words of the Bills sent up by the Assembly convey the meaning which the Assembly designed them to bear.

A HUNDRED YEARS SINCE.

It is only the outside of life and manners in foreign lands that the most observant traveller can see, and we know still less of the life of that vast half-discovered country, the past. Into the past all lovers of literature and all who care to think about the fortunes of our race must be constant voyagers, always searching, always "well deceived." We sail thither, as it were, "on broken pieces of the ship," on fragments of the elder world—books, pictures, bits of furniture, scraps of dress, gems, coins, the *débris* that float down the wave, or are dredged from the ooze of the stream of time. The past is so great in extent, and so full of diversities of manners and of landscapes, that there are some who prefer its many mansions to the narrow present, its silence and cool to our heat and noise; and who are more at home in their grandfathers' time, or in that of Cæsar, of Rhamses, or of Sennacherib, than in a world of penny papers, telegraphs, and lawn-tennis. Yet these investigators know nothing certainly, when it comes to a comparison of our living day with days that are all equally dead, be they those of Confucius or Dr. Johnson. We cannot, and never shall be able to, decide about the question of progress, to determine whether, on the whole, we are worse or better than our fathers. All the large epithets and sweeping classifications which dispose of this age or that in an epigram, and take leave of a century with a sneer, are so many waste words. We see, in the past as in the present, only what we bring eyes capable of beholding. How much clear knowledge, and sound art, and just thought existed in "the dark ages"; how full of scepticism, subtle as that of Hume, and crude as that of Mr. Bradlaugh, were the "ages of faith"! How bad the "good old times" were, how artificial the periods of refined simplicity, how rude were "the polite," and how petty "the great," at the courts of Louis or of Anne! It is in these matters of manner, of demeanour, of daily life, of comparative soberness or levity, ignorance or knowledge, simplicity or luxury, that we see the past most dimly, and can with least ease compare ourselves with our ancestors, or answer the question of St. Bernard—"To what have we come?"

To censure our own times is the stale fault of satirists, preachers, old men, old women, and public writers. There are certain points on which every epoch congratulates itself that it is better, or deplores that it is worse, than any that went before. Comparisons are always chiefly drawn, and mainly for purposes of pessimism, in the affairs that concern women. Even Æschylus, according to an English prose translator, declared that "among things which are no longer as they should be, I might mention the unbridled character of female passion." And everywhere and always people keep avowing that, if women are not what they ought to be, still less are they what they once were. The Puritan preacher detected in patches and curls and lace a return to the dread iniquities of the strange women whom Isaiah rebuked and Ezekiel flouted. The "unbridled luxury of women" was as common a text in the Paris of the third Bonaparte as in the Rome of Cato.

Now there are at least two or three good reasons which might suggest the folly and dulness of all the tedious disquisitions on women's foibles, and all the comparisons between women of the past and of the present. Little as we know about the men who are our contemporaries, and still more slender as our knowledge is of the men of the past—ghostly figures seen darkly through the glasses of comedy and memoir—we know infinitely less of women. "Poor little beasts," Guy Heavistone would say, when they were discussed in his hearing, and, after a moment's silence, he would stroke his heavy moustache, and exclaim "Egad!" The wisdom of the ages, its pity and contempt and its afterthought of perplexity, are sufficiently well caricatured in Mr. Bret Harte's burlesque. In spite of Solomon and Shakspeare, and Mr. Charles Reade, and Mr. George Meredith, we do not know much about the beings concerning whom we eternally debate. The great Schopenhauer, who had discovered the riddle (and an uncommonly painful one it proved) of the earth, was accustomed to dine daily at an ordinary in a German town. Every day he laid a louis beside his plate when he sat down, and daily he pocketed the coin when he had done his duty by his *Mittagessen*. A disciple who had long watched this ritual with wonder ventured to ask the master what he meant by an apparently superstitious practice. Was the gold piece an amulet

(like that lent by Montaigne to a friend on another occasion) to ensure the due digestion of dinner? "No," the sage replied, "but I have vowed to give this coin to the poor, when the military gentlemen present talk about some other topic than woman." Yet, despite the analysis, civil and military, of the sex, we know less than nothing about woman. She is the sphinx whose riddle Œdipus never answers, though he has chattered in reply ever since black men chipped flints and black women made pipkins among the ferns of tropical rivers that are now coal-mines. Nor is ignorance the only flaw in the dissertations about the women of to-day and the women of the past, about their bonnets, tea-gowns, extravagance, higher education, fitness for professions and votes, about the folly of their aping men, and all the rest of it. In all these affairs comparisons with past virtuous or vicious generations are little to the purpose, because, if we can say anything with certainty about the female nature, it is this—that women are changeless. Their talk to-day is the talk that the Syracusan poet reports in his famous idyl—talk about husbands, children, shawls, and servants. And Theocritus borrowed his dialogue from Sophron, a yet older observer, who borrowed from the garrulous nature that exists to-day, unchanged and unchangeable as the musical babble of birds.

From these considerations, which are general enough, to that particular instance, *The Polite Lady; a Course of Female Education, in a Series of Letters from a Mother to her Daughter* (Newbery, London, 1769), we may descend with inductive celerity. Just in the year when Boswell captured that great lion Dr. Johnson, a worthy lady set herself to describe the education of her sex as it ought to be. Montaigne rather sensibly observes that he left the schooling of his girl to the women, who in this matter had their own mysteries of government, with which he did not interfere. These mysteries are much and openly discussed in the days of Girton and Newnham and of Lady Margaret's Hall. But this series of imaginary letters from a mother, Portia, to her daughter Sophia, a young lady of sixteen, residing at a "finishing school," seem to prove that women's manners are very much what they were a hundred years ago. We certainly hear more of Greek, Latin, mathematics, metaphysics, and so on, in teaching; but the result, the emancipated schoolgirl in society, is just what she was. Fast maidens, girls who dress like men, young women who listen to and encourage loose talk, are not new inventions, as some weekly moralists in the press most innocently suppose. Sir Joshua's portraits have deceived us all, and made us think that our grandmothers four generations ago were as beautiful, pure, stately, and sweet as his illustrious sitters. After looking at some of his pictures—in which every woman seems a duchess, and every duchess a paragon—it is certainly sad to contemplate the mouldy greens and "intense" faces and expressions, or the gaudy hoods and too yellow locks, of the girls of to-day. But the author of *The Polite Lady*—the maternal Portia who lectures her Sophy in a series of some thirty letters—proves to demonstration that sweet serenity and maidenliness were as rare, and girlish rowdyism as common (and coarser) in 1769 as in 1880. We may go on to these matters of morality, without lingering long over the earlier letters of this educational course. In these Portia demonstrates that writing is a useful art, that ladies should be able to spell (to secure which end Mr. Newbery's author recommends "Newbery's Dictionary"), and that a knowledge of the four simple rules of arithmetic is serviceable to a housekeeper. That "dancing is one of the most genteel and polite accomplishments which a young lady can possess" will be admitted by all but the fanatics of the Higher Education, while even they will allow that "it is a kind of exercise which you may take when the badness of the weather hinders you from going abroad." Portia does not add, like Sir Thomas Elyot in the old treatise called *The Governour*, that "dauncyng" is a great teacher of moral prudence. As to the art of drawing, Portia's remarks prove that the Japanese style of Mr. Whistler and the early Ravennese manner of some "little masters" of the Grosvenor Gallery had their fashionable counterparts a hundred years ago. "Let the objects from which you copy," writes Portia, "be chiefly the works of nature, or at least such works of art as are faithful imitations of nature; and carefully avoid everything that is unnatural, whimsical, or romantic, as most Chinese drawings are." There is something in this criticism which reminds one of the worthy woman who on a Bank Holiday was heard explaining the works of Giotto and Margheritone d'Arezzo to a less experienced friend. "These," said she, indicating the early Italian designs in the National Gallery, "these are the Chinese pictures." To be done with the drudgery of a girl's schooling a century past, it is enough to notice the French books which Sophy's master first "put into her hands. They were *Gil Blas* and the *Diable Boiteux*, both of which, I think, are highly entertaining and improving." Entertaining, certainly, though how far they could be called "improving" it is less easy to determine. But if a Sophy of to-day could write to an approving mother, "My master has lately put into my hands *Madame Bovary* and *Moustache*, both of which I think are highly entertaining," it is obvious that French would be a more favourite study with schoolgirls than the *Télémaque* of Fénelon can make it.

The time came when Sophy paid a visit to an aunt in London. She found it "more difficult to conduct herself in London at the age of fifteen than it was in the country at nine or ten," and this ethical reflection Portia called "extremely just." The mother warned her "never to affect to be smart or witty," and not to go to Vauxhall (where Jos Sedley and Emmy and Becky went in more familiar later years) unattended by an elderly gentlewoman. A chaperon was a thing that Sophy could not endure. "We sometimes go to the play, the opera, Ranelagh, and Vauxhall, but then it is always in the company of an elderly gentlewoman. All our importunities have not been able to prevail upon her to let us go to the Sadler's Wells or Marybone. . . . As to diversions within doors, we have but few. My aunt does not seem to be as fond of gaming as some other ladies of her acquaintance. Pray, mamma, give me your opinion of all these matters in your next." Sophy at fifteen was a girl of whom one might say *elle ira loin*. Imagine a girl of fifteen, in our emancipated age, who should insist on gambling, and on going to see the *Danites*, and the public schools match without a chaperon! It is true that acrobats, not Mr. Joaquin Miller's diverting drama, were to be seen at Sadler's Wells in 1769, while music, rather than cricket, seems to have been the attraction at "Marybone." Sophy's mother justly asks, "What is the inconvenience of having a prudent lady along with you? Suppose that you and your cousins were allowed to go to Vauxhall by themselves. Why, some pert, forward, impudent young fellow comes up to you, and perhaps you are very well pleased with his politeness, and take a turn with him round the garden. Now, my dear, suppose the danger goes no further, as I hope it does not, yet do you know who this same young spark is?" As to gambling (which surely is not common among girls even now), Sophy is told to beware lest it foster the passion of avarice. In the matter of dress, Sophy is warned to shun the extremes of fashion, which, as now, often arrayed women in garments like those of men. "They tell me no man likes to see a woman strutting in a coat and hat; and yet, I am sorry to say it, the distinction of sex in dress seems to be very little regarded by our modern fine ladies. On meeting a company on horseback nowadays, one shall hardly be able to distinguish whether it is composed of ladies or gentlemen."

The danger of modern conversation may be considerable, and it is certain that many moralists exclaim against the laxity of talk. "The boasted beauties of the town, and their smart, witty admirers," seem to have been extremely free in the exercise of their humour in Portia's time. "What a small proportion do virtuous men bear," cries Portia, "to the foolish and the vicious? To the motley herd of empty fops, vain fribblers, shallow coxcombs, who intrude themselves into almost every company, and never fail to shock and offend by their lewd and immodest language." In almost every company, then, the majority of young men "talked in a lewd and immodest strain," which the coquette encouraged, says Portia, in a letter on that sprightly character. If we must have "fribblers," it is better that they should fribble about "divine lassitude," and "potentialities of passion," than that they should shock the ear of delicacy with lewd conversation. But on this and some other topics the ear of modern delicacy would be shocked by the expressions of the worthy Portia herself. Her treatise seems to prove that maidens a hundred years ago might be more unmaidenly than the fastest young women of to-day, for they gambled more, and swore as much; while, if they smoked less, it seems they wore extremely low dresses "on the Mall" in the morning.

SIR WILLIAM HARCOURT'S SPECIAL PROVIDENCE.

If the recent untoward event at Oxford has affected the Home Secretary's appetite—we know from the best authority that it did not affect his sleep—he must have gone to the Ministerial dinner on Wednesday night with renewed gusto. One of those sweet little cherubs who are known to sit up aloft and look after poor Jack has interfered in favour of Sir William Harcourt. Nor let it be thought that the allusion is an idle jest. Any cherub of sensibility must obviously have a fellow-feeling with the Home Secretary in his present plight; and if Sir William is not himself a sailor, he is, as we shall shortly prove, a friend of sailors. Indeed the cherub on this occasion was none other than Mr. Samuel Plimsoll, M.P. for Derby. Mr. Plimsoll has come to the conclusion that he cannot better serve God, his country, and Jack than by handing over Derby to Sir William Harcourt. Sir William is said to have accepted the offer, and is going to try on the Derwent that luck which has been so singularly bad on the Isis. But Mr. Plimsoll's motives, arguments, and manner of making his resolution known are much too original to be disposed of as if they were merely a preliminary to Sir William Harcourt's rescue (which is as yet a very problematical rescue after all) from the woes of seatlessness. The ex-member or rather the member for Derby was good enough to come before his constituents and to make an exceedingly clean breast of it, though we observe that not a few of the London papers, with unaccountable parsimony, have deprived their readers of the most interesting portions of his address.

Mr. Plimsoll began his explanation by observing, in the truest style of realistic narrative, "I was dining in the neighbourhood of Torquay on Monday, the 10th instant, with the doctor who is attending Mrs. Plimsoll, when he told me that Sir W. Harcourt had been defeated at Oxford." Even M. Zola could not find many faults with this exordium. We ought indeed to have had the doctor's name; the *menu* of the dinner should decidedly have been given; and, perhaps, a little diagnosis and a few prescriptions would have also been desirable. However, the member for Derby is a beginner in naturalistic art, and perfection cannot be expected at once. Having received this information, it seems Mr. Plimsoll instantly

thought "Is it possible to turn this incident to the good of the sailors?" Unless Mr. Plimsoll habitually asks himself this question at each moment of life, something on the *delenda est Carthago* principle, which we think not improbable, the demand seems a bold one; but the questioner was, it will be seen, serious. He went home, and, as all good husbands do, laid the matter before his wife. Here let us pause to assure Mrs. Plimsoll of our most distinguished consideration. If her name comes into the discussion it is her husband's fault, not ours; and, as will be seen, the lady plays a highly creditable part therein. Indeed we cannot help thinking, from the intelligence displayed in Mrs. Plimsoll's remarks, that it is rather a pity that the seat at Derby cannot be handed over to her. However, this, to the indignation of Miss Becker and Lady Harberton, is at present impracticable. So Mr. Plimsoll said, "Eliza, the Home Secretary has been defeated at Oxford, and I want to ask my constituents to let me give him my seat for Derby." The simple answer of Mrs. Plimsoll was "Why?" and volumes could not have said more. "To help the sailors," was the rejoinder, and again Mrs. Plimsoll was more than equal to the occasion with the retort, "How will that help them?" Mr. Plimsoll's reply to this extremely pertinent demand was long and can only be summarized. It seems that the existing Acts for the protection of sailors are murderous impostures, that Sir W. Harcourt has at different times given Mr. Plimsoll a helping hand, that Derby is a model constituency, and that Mr. Plimsoll reckons that by doing the Home Secretary this good turn he will establish a pretty strong claim on the Government to back his favourite schemes. Instead of attempting to reply to this ratiocination, Mrs. Plimsoll for the third time hit the nail on the head by the simple query, "What will they say at Derby? Won't they think you undervalue their confidence?" To this Mr. Plimsoll made answer in another speech of some length, in the course of which Socrates would infallibly have tripped him up more than once. But Mrs. Plimsoll, though evidently possessing faculties for the exercise of the Socratic Elenchus of which any one might be proud, regards her husband with too much respect to treat him in the fashion of the irreverent stonemason. She waited till he had done, and then, modestly disclaiming any intention of standing in the way of the sailors, repeated her question, "What will our personal friends at Derby say?" This was a poser, and we cannot think that Mr. Plimsoll showed his superiority in debate by the remarks that the friends were Christian men, that "duty and self-denial are close companions," or that "the railway will still remain"—the last of which seems rather to resemble the observations used dialectically by Mr. F.'s aunt. Indeed it is to be suspected that the masculine champion found himself getting the worst of it, for he had recourse to a very old way of closing the discussion. "Let us," he said, "take the matter to God, and seek His guidance." We shall best avoid the charge of irreverence in recounting this portion of the affair, by letting Mr. Plimsoll speak for himself:—"We did; we reminded Him of the word of His promise, and when we rose the path of duty was as clear and plain before us as a turnpike." The *personnel* of the debate having been thus unexpectedly enlarged by making the Deity a party to it, Mrs. Plimsoll evidently thought it better not to continue her remarks; and perhaps her discretion may with advantage be imitated. It may, indeed, strike some persons that the Liberal party have been making rather free with the Divinity in the last few weeks, and that He has been brought in and left out, forgotten and reminded of His existence and attributes, in a manner which is, to say the least, curious. The anthropologist will also reflect that it is very odd how references of this kind invariably turn out in the way most suitable to the wishes of the referring party. When the excellent Hugh Peters put his head down on the pulpit cushion and made a similar reference as to the troubles of England, it is recorded that in a very few minutes the answer about making away with the man Charles Stuart—which could hardly be a new idea to Mr. Peters—was vouchsafed. So also, when Mr. Plimsoll had already made up his mind to resign his seat at Derby, did he receive speedy illumination of a favourable kind. After this he of course considered the matter settled, and Mrs. Plimsoll asked no more inconvenient questions. Her husband wrote his letter to Derby, and followed it up by his presence at the meeting, the chairman of which, by the way, was a Mr. Hall—not a name of the best omen for the Home Secretary. It seems that at a more private meeting held the day before, the prudent forecast of Mrs. Plimsoll had partially come true, for not a few of "our Derby friends" took the view of the matter she had suggested. But at the public assembly Mr. Plimsoll had it all his own way, as a man thoroughly and earnestly convinced almost always has. The field, as far as the Liberals are concerned, appears to be clear for Sir William Harcourt.

Not having ourselves received any special revelation of the kind which cleared Mr. Plimsoll's path and silenced the objections of his, in this instance, very much better half, we do not know that the matter seems to us altogether so much of a "turnpike." The announcement, made almost simultaneously with the news of Mr. Plimsoll's retirement, that Sir Robert Peel would contest the seat was, it seems, false, or at any rate premature. It seems not improbable that Sir Robert might be induced to do so; and, if he did, there would assuredly be a very pretty fight. He is extremely popular in the Midlands. He is as good a speaker from the popular point of view as Sir William Harcourt; and the passage of arms between them at Oxford would find an appropriate sequel in a duel *à outrance* at Derby. Even failing Sir Robert, it is not certain that the seat would be allowed to go without an effort. Derby has been decidedly Liberal lately, though, if we mistake not, Mr. Plimsoll himself had a Conservative colleague for some years. The influence of Mr. Bass is great in the town, and, should there be a contest, Sir William Harcourt will find it necessary to modify or suppress his favourite references to beer. But the chief reason for anticipating a fight is to be found in the manner in which the vacancy has been created. Constituencies, as Mrs. Plimsoll evidently knows, are by no means fond of being handed over in this way, as if they were so much portable property. Sir William Harcourt is not exactly the most popular of men, and the voters of Derby must, we should suppose, feel a little humiliated by such an eccentric performance as that of which we have endeavoured to give a faithful account. It may well seem to some inhabitants of the town of silk that they have been cavalierly treated. There are probably a few, if not more than a few, to whom Mr. Plimsoll's "reminders" to the Almighty, and his assumptions as to the Almighty's intentions, may seem blasphemous. There must be many to whom they will seem, whether blasphemous or not, to be ineffably indecent and disgusting. It is not every large town which has the touching modesty of Leeds, and which is content to serve as a lumber-room, and to put up with the despised and rejected of more independent constituencies. However, this is Mr. Plimsoll's and Sir William Harcourt's look-out. The former has merely added one more chapter to the history of the general election of 1880 and its consequences, a history which bids fair to be one of the most remarkable political documents of modern times. As yet scarcely a week, indeed we believe we may say not a single week, has elapsed without some member, small or great, of the party which last month won such an enormous victory, exhibiting himself in a more or less ridiculous light, and the amusement does not seem at all to pall upon the players. Whatever result "the sacrifice" may have—we should observe that Mr. Plimsoll, while quite justified in calling it a sacrifice on his own part, was hardly polite to the Home Secretary in describing the proceeding as a sacrifice on the part of the people of Derby—Sir William Harcourt's claim to be a precious and elect soul in the sight of Providence has been established. It is not every luckless wanderer in search of a seat who has such mercies, and we trust that the Home Secretary is duly thankful, and that when he gets into Parliament he will remember his indebtedness. In selecting him for the purpose the avowed predilection of Heaven for the meek and lowly in language and behaviour seems to have been somewhat overlooked. Mr. Plimsoll perhaps forgot to "remind" Providence of the fact. Still it is never too late to mend, and Sir William, when he sits for Derby by the grace of Mr. Plimsoll, may prove to be a reformed character. And yet we cannot help feeling some misgivings. There is an air, as we have already observed, of evil omen about some of the proceedings. Mr. Plimsoll made references to the crowning act of Samson which cannot be considered happy; and it is just possible that he may, after all, have mistaken the intentions of Providence. There is much matter for reflection in a text which diligent students of the Scriptures such as Mr. Plimsoll is, and as Sir William Harcourt ought to be, must remember. Perhaps it may have been a case of "Go up to Ramoth Gilead and prosper."

THE CHURCH REFORM UNION.

THE world has always been ignorant and careless of its greatest organizations, and we are worldly-like the rest. A prospectus lately reached us of the Church Reform Union, and upon looking down the list of the members of its Council which fills the first page, we were confronted, among other notabilities, by four head-masters, four popular London preachers, an earl, two baronets, a knight, and an Oxford and a Cambridge professor, besides Mr. Cowper-Temple, the Dean of Westminster of course, and as might be expected, Mr. Thomas Hughes as Treasurer, not to mention the fire-new county member who has just moved the Address among the secretaries. Bewildered by such grandeur, we turned over the leaf, and were astonished at the revelation that this venerable Association has already existed for ten years, "although no report has been presented by the Union for the last seven years"—actually not for seven years, and all the time the worst Administration ever known has been lowering like a black and baleful cloud over Church and State. The Union was "formed in 1870 for the purpose of bringing together for united action" that hitherto unknown and unimaginable section of humankind, "those who believe a National Church to be necessary to the highest well-being of England." Yet, in spite of its discovery of this curious race of thinkers, it has confined the unity of its action to a simultaneous and most successful effort after holding its tongue for a long week of years.

Its apology for existing—for simple existence, as contrasted with sentient activity, we must grant to it so long as it can lay claim to the organization of a titular Council projecting an ostensible Treasurer and Secretaries—is a very common and, in spite of appearances, harmless accident of all times of general fermentation. The appeal to popular ignorance on which it relies is very easy to frame, while, after an imposing array of alleged wrongs and insinuated remedies, it reveals its consistency and grasp of principle by touting for support with the assurance that "membership of the Union will be understood to imply general agreement only, and not an approval of all the plans which the Council may put for-

ward." A great and many-sided old institution, ramifying in all directions and touching every interest, is selected as the *corpus vile* for this experiment in reform, by parading a pretence of general agreement through the ridiculous device of creating a membership which repudiates approval of the plans to further which those members have been invited. The Council—who would, we fear, be described by a sporting member as a scratch team—are duly paraded to give garnish to a couple of pages of "Objects," and a Report. These two documents are so very ambitious as to defeat their authors' own intentions. The six omnibuses at Temple Bar would have been mere wheelbarrows compared with the *cortège* of caravans which the Church Reform Union has been marshalling during its seven dark years of silence and retreat. In one short pamphlet all the shortcomings, real or supposed, which any grievance-monger has ever attributed to the body on the dissecting table are set forth with expedient brevity; while remedies, which no member is expected to approve, are suggested with corresponding vagueness. The impressive conclusion is that the machinery with which the Council declares itself ready and able to reform the Church in all its aspects is "an annual subscription of 5*s*. and upwards," although "a donation of a guinea constitutes a Permanent Member"; a very low rate, we think, at which to purchase the privilege of belonging to a Union which possesses the secret of transfiguring the Church by a process of general agreement which repudiates approval. The Burials Bill, which naturally fills a prominent place in the programme, is recommended on the somewhat original plea that it will "strengthen the attachment of people to the National Church"; and that grotesque bantling, the Occasional Sermons Bill, which was laughed out of the very Liberal Parliament of 1868, is loudly commended with the suggestion of its being improved by grafting upon it the additional absurdity of "a proviso removing the existing impediments in the way of Anglicans responding to like invitations to occupy the pulpits of their Nonconforming and Protestant brethren." Stript of unctuous jargon, this suggestion means a demand upon Dissenting ministers to submit to the moral compulsion of having, whether they relish the intrusion or not, to be consistently happy to lend their pulpits to dear Episcopalian brothers on pain of branding themselves as intolerant, unneighbourly curmudgeons. The more sacerdotal the clergyman is, the more likely will he be to clutch at a concession which will be to him the opening out of one more secular lecture-room; while his Evangelical neighbour to whom consecration is only *tolerabilis ineptia*, but who has an acute perception of the comforts of an orderly Establishment will quake and doubt over the prudence of raising the rostrum of Ebenezer to the level of the parish pulpit.

All this however is only parson-badgering; paternal government for the faithful laity is equally included in the Union's scope of universal operations. It parades a stale cry that "the laity have not their fair place and work in the Church system"; which may have had a colour of truth about it at the time when any share of Church work would have been to the laity in general an intolerable bore, but which is at present a simple perversion of plain fact, except in the limited and technical sense of the "Convocatio Cleri" being, by the nature of its constitution, a body into which laymen are inadmissible, just as none but doctors find admission into the Medical Council. Otherwise, with Parliament putting forward irrepressible pretensions to regulate all things divine and human, with diocesan synods, archidiaconal conferences and ruridecanal meetings, with Church Congresses and religious Committees, Funds, Unions, Associations, Guilds, Trusts, and Institutions of all sorts and colours, besides the old constitutional Vestry in every parish, the laity have now a place and work in every branch of the Church system—which may be fair or may be unfair—but, if unfair, certainly does not deflect from equity on the side of deficiency. The weakness of these methods of bringing laymen into working partnership is obviously the want of a regulating power to concentrate and harmonize local efforts. So persons who have studied Church polity with a greater strain upon their reasoning faculties than our United Reformers seem to have realized during these seven years of silent incubation, have suggested some central body of elected laymen which might exist in consultative relations to Convocation. There is much to be said for this scheme and much against it, and it still vegetates in the limbus of ideas; but, anyhow, it legitimately endeavours to grapple with the place and work of the Church laity as a whole. But the nostrum of our Union is compounded of very different elements, and is, in fact, the crude revival of a project which has been dangled before the eyes of former Parliaments, for forcing upon all parishes, without regard to local circumstances, by Act of Parliament, some cast-iron form of Church Council, recommended on the impudent pretext that "the power of the parish priest is that which has come to be the most out of proportion in our Church system; and his 'autocracy' not only can bear, but requires, to be limited." This limiting gift of the beneficent Union is so adjusted as, by the double operation of perpetually contested elections and of chronic debates, to plunge and keep the parish in eternal hot water by perpetuating and accentuating every doctrinal and ritual difference which an elastic and informal system of reciprocal giving and taking would, in the long run, most certainly harmonize.

These are but samples of the impossible programme of a Society which has hitherto shown itself as impotent in action as it is now fussy in its pretensions. The consummation at which it aims is "a truly national Church," carried out by "the co-operation both of Churchmen who desire the development and expansion of the Church of England and of all who set their hopes on a Christianity free from sectarianism."

Christianity free from sectarianism is a truly sublime and engaging idea, and we shall most surely contribute to its accomplishment by a practical endeavour to work out the process by which the blessed end may be attained. Let us hope that in another seven years or so, a congress of representative Christians may be assembled in the Council chamber of the Union, with the Dean of Westminster, as active as ever we trust, in the chair. Lambeth may be unrepresented, and then whoever may be Archbishop of Westminster will perhaps be invited to start the discussion, and the prelate's argument will not impossibly be that the surest way of purging Christianity from sectarianism is to cast out the very idea of a sect as something in itself unclean and intolerable, by the recognition of a living and always accessible, embodied, and infallible centre of reference to which all Christians will agree to defer, so as to secure perpetual unsectarianism. It is just conceivable that the meeting may not close with the suggestion, and then the company may agree to tolerate the actual Church of England as its point of departure, so as, by gradually purging it of the dross of sectarianism, to elevate it to the sublime attitude of a truly National Church. Its Episcopal constitution will of course go first, for the Presbyterian will be able unanswerably to urge that the acceptance of that sectarian creature, a Bishop, would make it impossible for him to accept the English Establishment as a truly National Church. "Write the Church of the future down as non-episcopal and unsectarian," the chairman will suggest; upon which the Congregationalist will jump up and denounce the tyranny which would fain compel him, whose first principle of Christian liberty is the right of every congregation to take and make its own minister, to accept the essentially sectarian figment of any, even a Presbyterian, succession, as requisite in a truly national Church. "Then, gentlemen, will you agree upon ministers without any succession?" the chairman will ask in much bewilderment. "Ministers indeed! sectarian usurpers," the Quaker will protest. So the truly National Church will at last be started on its unsectarian career with no ministry at all; while sacraments and forms of worship will, by a similar process of detrition, be speedily disposed of, and the meeting will next proceed to consider what the unsectarian truly National Church must exist to believe in and to teach. "The Catholic Faith," somebody may suggest; and the assembly might probably agree that this was an eminently safe and respectable definition until the assembled sages proceed to define it. The Unitarian will catch the chairman's eye, and remove to the limbus of sectarianism a very large and important portion of the body of belief which usually passes under the accepted appellation; and the creed, as unsectarianized by him, may be put to the meeting. But the Theist will insist on his right to be heard, and will successfully urge his claim to have his inclusion within the unsectarian National Church guarded by the frank admission that "Christianity" cannot, consistently with unsectarian principles, be tortured into meaning more than the profession of monotheism as against polytheism, and of a First Cause as against Agnosticism. The Agnostic will back him in the negative part of his argument, while further contending that it is still more reasonably and completely unsectarian to define Christianity as the acceptance of that morality which has grown up under the accumulated influence of European so-called Christian civilization, rather than to attach the term to speculations over a First Cause, belief in which implies adherence to a sect. So at last the true unsectarian National Church will be reached; but in the moment of its triumph the Church Reform Union may discover that that mighty body numbers, all counted, a former member for Northampton as sole representative, while the remaining inhabitants of the three kingdoms obstinately prefer to stand outside in the cold shade of anti-national sectarianism.

The Church Reform Union has now gratified itself and amused the world by discharging its decennial popgun. If it desires to sustain the character of a success within the limited area of its spasmodic operations, we venture to advise it to strive to be as little heard of and as little thought of as possible until the advent of 1890 enables it to claim the attention of an ungrateful world by a manifesto even more flatulent and more unpractical than the one to which we have endeavoured to do justice.

MILITARY HONOUR.

THE reminiscences connected with our late war against the Zulus have certainly not been of an altogether agreeable nature; and, worse still, it seems that we are destined never to reach the end of them. Although months have elapsed since hostilities ceased and peace was declared, some unpleasant question or some grave scandal is continually cropping up. The latest and most serious instance of this nature which occurred during the whole war has only recently been brought fully to light. Our readers may remember that in January 1879 a detachment of the 80th Foot, which had encamped on both banks of the Intombi river, was surprised in the night by the enemy. The officer in command and several men were slain, and the remainder had the greatest difficulty in extricating themselves and retreating. The conduct of the officer second in command, who was, moreover, the sole officer surviving, excited considerable remark at the time. He

appears to have mounted his horse and to have ridden off at full speed to obtain reinforcements, leaving a sergeant in command of the party; and, as he had upwards of four miles to traverse, it was obvious that, for good or ill, the affair would be over long before he could rejoin his men. It is stated that Lord Chelmsford ordered an inquiry into the whole affair, and expressed his opinion that the officer in question had acted for the best, after which the matter dropped for a time. Some months afterwards a claim for the Victoria Cross was put forward on behalf of the sergeant who conducted the retreat of the survivors, and when the evidence, which according to regulations accompanied the claim, was read, it became obvious that, if the sergeant was to be decorated, the officer must be called to account. Accordingly, a general Court-martial was summoned. The Court acquitted him; but here we had better quote the special General Order issued by the Commander-in-Chief on the subject. It runs as follows:—

"At a general Court-martial recently held, an officer was arraigned upon the following charges. 1st. Having misbehaved before the enemy, in shamefully abandoning a party of the regiment under his command when attacked by the enemy, and in riding off at speed from his men. 2nd. Conduct to the prejudice of good order and military discipline, in having, at the place and time mentioned in the first charge, neglected to take proper precautions for the safety of a party of the regiment under his command when attacked. The Court recorded a finding of 'Not Guilty' on both charges. The main facts of the case were not in dispute. The officer rode away from his men to a station distant 4½ miles, at a moment of extreme danger, when, to all appearance, the small party under his command were being surrounded and overwhelmed by the enemy. The charge alleged 'misbehaviour'—that is, cowardice—in so doing; the defence averred that it was to procure reinforcements, and either by their actual arrival, or by the imminence of their arrival, to ward off destruction. In acquitting the prisoner they have found that he was not guilty of cowardice. The proceedings of the Court were submitted to the General commanding (Sir Garnet Wolseley), who recorded the following minute:—'Disapproved and not confirmed; Lieutenant . . . to be released from arrest and to return to his duty.' The confirming officer has further recorded his reasons for withholding his approval and confirmation in the following terms:—

Had I released this officer without making any remarks upon the verdict in question, it would have been a tacit acknowledgment that I concurred in what appears to me a monstrous theory—namely, that a regimental officer, who is the only officer present with a party of soldiers actually and seriously engaged with the enemy, can, under any pretext whatever, be justified in deserting them, and by so doing abandoning them to their fate. The more helpless the position in which an officer finds his men, the more it is his bounden duty to stay and share their fortune, whether for good or ill. It is because the British officer has always done so that he occupies the position in which he is held in the estimation of the world, and that he possesses the influence he does in the ranks of our army. The soldier has learned to feel that, come what may, he can, in the direst moment of danger, look with implicit faith to his officer, knowing that he will never desert him under any possible circumstances. It is to this faith of the British soldier in his officers that we owe most of the gallant deeds recorded in our military annals; and it is because the verdict of this court-martial strikes at the root of this faith that I feel it necessary to mark officially my emphatic dissent from the theory upon which the verdict has been founded."

After thus recapitulating the history of the affair, the General Order concludes as follows:—"In communicating to the army the result of this Court-martial, the Field-Marshal Commanding-in-Chief desires to signify his entire approval of the views expressed by the confirming officer in respect of the principles of duty which have always actuated British officers in the field, and by which His Royal Highness feels assured they will continue to be guided. This General Order will, by His Royal Highness's command, be read at the head of every regiment in Her Majesty's service."

So ends the official cognizance of this deplorable business, and we need hardly say that we heartily concur in the soldierlike, straightforward views expressed by Sir Garnet Wolseley, and in the confirmation they have received from the Commander-in-Chief. There is obviously no palliation or excuse for the behaviour of the officer in question. His duty was clear. The party which he commanded was placed in a situation of imminent danger, and in his double capacity of commanding officer and sole officer present he was bound in honour to remain with it. If he possessed a horse, he should have called for a volunteer who could ride to summon assistance; but, even were none forthcoming, not the less should he have remained at the post of duty. In a somewhat similar case which occurred in the same campaign it was pleaded, with some show of reason, that the service on hand was a reconnaissance, in which it is the custom of war for every one concerned to look after himself; but even this excuse is wanting in the present instance. But, bad as the case is, worse yet remains. Assuming the correctness of the statement we have quoted from the General Order—namely, that "the main facts of the case were not in dispute," and that "the officer rode away from his men to a station distant 4½ miles at a moment of extreme danger"—we can only say that the finding of the Court-martial is, to our mind, one of the most disgraceful episodes of a war not too fertile in creditable or honourable achievements. It is both conceivable and intelligible that here and there a man may enter on the profession of arms who is morally quite unfitted for it, and, as peace-time affords no opportunity for testing his qualifications or exposing his weaknesses, it follows that on service the safety of his comrades, and the honour not only of his profession but of his country, may be compromised at any critical moment. This of itself is bad enough; but what language can be too strong to condemn the action of those who by their verdict acquit such an officer of all blame, and thus tacitly express their approval of his conduct? It must be borne in mind that the Court-martial which tried the offence was not composed of officers belonging to the prisoner's regiment, who might be biassed in favour of a comrade; nor of young and inexperienced members. The Army Discipline and Regulation Act requires that an officer must have three years' service at least before he can sit as a member of a general Court-martial, and the Court must, moreover, be composed of officers belonging to different regiments and branches of the service. The fact that such a Court, or at any rate a majority of the Court, could arrive at such a verdict is, to our thinking, the most deplorable part of this deplorable affair.

Is the finding of this Court-martial to be accepted as illustrating the standard of duty and devotion at present existing among our officers? There is no saying more common in the army than that a Court-martial is a court of justice and of honour, not a mere court of law. Where is the justice, and where is the honour, in the present instance? We can see no trace of either. No feature of modern war is more marked than the increase of responsibility which devolves upon subordinates, and they should be prepared to accept their responsibility or to expect a heavy penalty if they prove themselves unfit for it. Yet here is a case in which a subaltern who has, at a moment of imminent danger, shown himself destitute alike of resource, presence of mind, and even common courage, is acquitted of all blame by a military tribunal and permitted to return to his regiment. It is true that he has since had the good sense to resign his commission, but we have not to thank his judges for that. Our thanks are due solely to the General whose manly and soldier-like instincts were outraged alike by the conduct of the prisoner and his judges, who justly branded the verdict of the Court as "monstrous," refused to endorse it, and administered to its members the stinging rebuke above quoted. Never was rebuke more merited. The good name and the honour of our army are exclusively in the hands of its officers, and if this is their way of upholding them, both must disappear. When we consider the affair in all its details, whether as regards the misconduct of the officer in question or the way in which it was tacitly sanctioned by his brother officers, we can only express our conviction that it forms one of the most humiliating episodes of the Zulu war, and that is saying a good deal.

A COLLEGE TO LET.

FORTUNATELY the searchings of heart which have been caused by certain recent events at University College, Oxford, are put an end to by the voluntary surrender of the culprits. But it must be admitted that that venerable institution has achieved a not wholly desirable fame during the last fortnight. On Tuesday week it seems there was feasting in its halls. Reporters at once jumped to the conclusion that the feast was a bump supper, a form of academic festivity made notorious by novels. One instructor of the public even went so far as to inform his audience that a bump supper was a feast given to celebrate the act of being bumped as well as that of bumping—an announcement which will probably be news to Oxford men. This particular repast, however, appears to have been not a supper but a dinner. There was a time when the hair of every Don in Oxford would have stood on end at the idea of such a dinner, while suppers—though not exactly well-looked-on institutions—were still permitted. Latterly, however, it has seemed to the wisdom of the Common Room that the earlier the feast the less likely is it to end in disorder, an idea not wholly unfounded in fact, inasmuch as the air of a college quadrangle at midnight is somehow or other full of subtly provocative influences to riot. However, it is possible to dine as well as to sup too well, and the consequences of dining as of supping excessively are uniform. Everybody knows the three grapes which, according to the Welsh Triads or the Arabian philosophers or some other of the stock sources of sententious wisdom, the vine bears. The three grapes that are borne by the vine that grows on the banks of Isis may be said to be those of noise, of intoxication, and of "drawing." Now of drawing there have been from time out of mind two varieties, an active and a middle voice, so to speak. The first consists in forcible entry into the premises of an obnoxious person, the second in forcible prevention of exit by the application of screws, or, if the operators are skilful and have plenty of time at their command, of gimlets driven home and deprived of their handles. Further, either operation may be practised in the presence or absence of the occupant, and the proper thing for a screwed-in or screwed-out victim is to effect his entrance or exit, as the case may be, by means of a ladder. To complete the scientific account of these exercises of the art of academic carpentry, it may be well to observe that screwing-up is most observed towards Dons; drawing, in the strict sense—the word being derived from the habits of that favourite academic animal, the badger—towards men. To resume the narrative which this exposition of the scientific side of the subject, necessary for the correction of vulgar error, has interrupted, it appears that after the dinner at University College, the rooms of Mr. Chavasse, Senior Fellow but one, and, as it happened, also Senior Proctor of the year, were screwed up. This was an instance of the lesser excommunication, for Mr. Chavasse was not in his rooms at the time. On returning he might apparently have sent for a

carpenter and effected an entrance without much difficulty; but it seems that, with a laudable desire to play the game thoroughly, he performed an act of ascension with the ladder, according to the rule for such occasions made and provided. Now it so happens that the community of University College is presided over by a gentleman who has won great fame as a schoolmaster. Contrary to the opinion of the outside public, it is not unusual for the Head of a college to stand in the gap between the Fellows and the undergraduates, his relations with the latter being for the most part amicable, if not formal only, and not implying the strains which sometimes exist between the race of men and that of tutors, deans, and other natural foes of undergraduate humanity. On this occasion, however, Mr. Bradley seems not to have been the adviser—at any rate he was certainly not the mouthpiece—of moderate counsels. The undergraduates were summoned to meet in the college hall next day, and were informed that they were to "go down" in a body that evening, exceptions being made in favour of those actually in the schools, and of such as should make formal declaration of their innocence. The effect of this latter unlucky clause could have been foretold by any Oxford man in whom years of Common Room had not blunted memory. It was at once interpreted as an underhand and discreditable "dodge" to obtain the names of the guilty by a process of exhaustion; and not only was the proposition resisted, but, it is said, an offer on the part of the amateur carpenters to give themselves up was rejected by the indignant undergraduates in conclave assembled. So University College went down that evening, and descended on its surprised families with such intervals as seemed good to the individual exiles. Touching pictures of the hardships and the dangers to which tender youth were thus exposed have since been drawn by the said families. It will probably occur to most people, however, that the virtue of an undergraduate who is not to be trusted one night in London is a very "thin thing," indeed, and need hardly be taken into account in estimating the matter. Finally the perpetrators gave themselves up, and the remaining exiles were invited to return.

It need not be said that condemnation of the action of the college in this case as ill-judged by no means implies approval of the foolish and unmannerly freak which provoked it. But whereas wisdom and judgment are not exactly expected of boys of twenty, they are expected of the mature persons who stand to those boys in the relation of temporary parents and guardians. It may be safely said that the elaborate insult to the college and the University which the authorities discovered in the screwing, being assisted to this discovery by the fact that there was a matriculation next day, existed simply in their own brains. Oxford men are not wont to be deficient in respect for their own college or for their own University, and it may be hinted that reverence for these two entities is at least as often to be found in undergraduates as in their seniors. The silly horseplay from which Mr. Chavasse suffered is, however, something of an institution, if an institution more honoured in the breach than in the observance, and nowhere is it more of an institution than at University. Twelve years ago that college was described in words which are appropriate enough to-day:—"Here many dogs are kept, and a feud exists between the older men and the younger men, so that sometimes the younger men rebel openly and with screws and nails fasten the doors of the older men." With Merton and Brasenose University has long held rank as a college which, while it despised not the liberal arts, also understood how to be foolish in (and frequently out of) season. The inhabitants of its two staid old quadrangles have always been in more senses than one "monks of the screw," and have given themselves plenty of opportunities of hearing the chimes at midnight. To what this tendency is to be attributed it is difficult to say. It cannot be the fault of King Alfred, because, in the first place, that monarch had no more to do with University College than with the British College of Health, and because, in the second place, he is not recorded to have made merry over anything more intoxicating than a muffin. It could scarcely have been muffins that made a member of University, in the last decade but one, plant an umbrella in the sward of the grass plot and then implore that vegetable to "grow," subsequently bewailing with tears its obstinacy and unfruitfulness.

All this is folly and vanity doubtless, but it is folly and vanity of a kind which does not last long into life, which does not, as a rule, do much harm at the time, and which leaves perhaps even pleasanter memories in minds that have long settled down to hard work than solemn constitutionals over Shotover and painful breakfasts with elaborately amiable Dons, the two recreations that are sometimes supposed to be the sole amusements worthy of serious youth. It is certainly not necessary that festivities should culminate in the screwing up of Proctors' doors, and any such proceeding ought to be visited with due penalties, if it be not—which is better still—prevented by the establishment of good relations between the two parties. An escapade of the kind—to which Mr. Chavasse, who has been a Fellow of the University for nearly twenty years, ought to be sufficiently accustomed—may be fairly met by gating, by the refusal of the usual privileges and liberties of Commemoration, and by other penalties which make the victims quite sufficiently uncomfortable. Rustication of the actual offenders, as soon as the compulsory residence of the term was completed, would not seem to any one too severe a vengeance; but to endeavour by a roundabout way to make the innocent give evidence against the guilty, and, in default, to punish innocent and guilty alike, is not only a proceeding savouring of very little ability to command except with a state of siege, but one certain to defeat its own object in consequence of the code of honour usual among youthful English gentlemen. Had the college inflicted rustication generally, with the proviso that the guilty parties might save their comrades by denouncing themselves, it would have been a somewhat high-handed and impolitic measure, but one to which no exception could be taken morally. It is, moreover, obvious from what has occurred that it would have been successful. As it is, the whole sting was taken out of the rustication while it lasted, as far as the undergraduates themselves are concerned, by the injudicious conduct of the Master and Fellows. Even the stern British parent has taken the side of the delinquents, who, instead of being regarded with just displeasure, have been placed in the position of being victims of an honourable scruple and a clumsy stretch of authority. No one could reasonably have found fault with the actual criminals for not giving themselves up when they were never asked to do so, while certainly no one could find fault with the innocent for refusing to criminate their fellows. The whole proceeding may perhaps be thought to show the impolicy of appointing schoolmasters to the headship of colleges—a practice which, since the disfavour into which schoolmaster bishops have fallen, has been only too frequent. The relation of a college Head to the Fellows and to the undergraduates is widely different from that of a head-master to his assistants and his boys. The head-master is, or ought to be, practically autocratic; the Head has at most a moral authority and a casting vote. The assistant masters of a school are theoretically powerless; the Fellows of a college are theoretically and practically all-powerful. But, beyond all this, the peculiar character of the undergraduates' status has to be considered. Anywhere but in England, even in the sister kingdoms, they would be practically, if not legally, *sui juris*, and under no kind of domestic authority whatever. The restraints and the discipline of a college at Oxford or Cambridge, but especially at Oxford, are a standing marvel to all foreigners, at least as much of a marvel as the supposed luxury and extravagance of those much-abused establishments. To maintain this most salutary combination of liberty and restraint needs a very delicate hand; and it is certainly not too much to say that there is no trace of delicacy of hand in the recent proceedings of the Master and Fellows of University College. That there is something wrong indeed is evident from the mere fact of the screwing up. Such proceedings have often been unknown in the liveliest years of the liveliest colleges of the University, where, though mutual "drawing" may have been frequent, and though bonfires and other forbidden antics have often kept hapless Dons out of their beds for weeks together, no personal inconvenience or insult to them has been attempted. To set the something wrong right by a proceeding which would be not too much in place in the case of a fifth-form revolt in a grammar school is certainly not a masterstroke. Moreover now that the culprits have, notwithstanding the veto of their comrades, voluntarily given themselves up, the Fellows and Master are in a singularly awkward position. They have invited the return of the thirty or forty innocent exiles whom they have banished, in a manner which must for some time make the restoration of proper feeling, to say the least, difficult, and which amounts to a confession of their own incompetence to govern. This view of their conduct does not, let it be once more repeated, imply the slightest approval, or even excuse, of Mr. Chavasse's tormentors. It is simply an inevitable result of a cool consideration of the circumstances and consequences of the transaction.

CARDINAL NEWMAN ON THE CONVERSION OF ENGLAND.

OUR readers are aware that Cardinal Newman has been paying a week's visit to London, as the guest of the Duke of Norfolk. It was his first public appearance, so to speak, since receiving his new dignity, and he naturally took the opportunity, or rather no doubt was urged to take the opportunity, of delivering an address before "The Catholic Union." His audience however was a miscellaneous, though an attentive and enthusiastic one, by no means confined to members of his own communion. Nor is it difficult to understand the deep interest created both in the hearers, and afterwards in the readers, of his discourse on the Conversion of England. The time has gone by when crowds would gather, even in London, either from curiosity or from some stronger feeling, whether of respect or disrespect, merely to stare at a live Cardinal in his scarlet robes. For thirty years past we have been pretty well habituated to that once unwonted spectacle, and Protestants have learnt to gaze with as much equanimity at the Babylonian symbol which once affected their nerves as a red rag is said to act on a mad bull, as Oxford undergraduates gaze after their first freshman's Sunday at the scarlet procession of Heads and Doctors at St. Mary's. In truth the least point of attraction about Dr. Newman to the outer world is the fact that he happens to be a Cardinal, though no sensible man grudges him the honours thus tardily awarded by the Church of which he is so conspicuous an ornament. For many years past, whenever it has pleased Dr. Newman to deliver himself of any public utterance, his countrymen have been eager to listen to what he had to say to them. And his two latest deliverances—the address at Rome last year, on receiving his Hat, on which we commented at the time, and his address the other day at Willis's Rooms—do, whether by design or not, very remarkably complement each other, and bring out in con-

junction two leading antitheses of the religious and ethical teaching so impressively and consistently exemplified throughout his whole career, both in the Church of his birth and of his adoption. In his Roman address he insisted, as he has always insisted since the appearance of his earliest work on *The Arians of the Fourth Century* in 1833, on the supreme importance of the dogmatic principle, and protested against the favourite theory of modern religious liberalism that "one creed is as good as another." In his address the other day he dwelt, as he has again and again done before, on the duty of recognizing under its different aspects the supplementary truth of the due place and importance of natural religion. It may be just worth noting that there is no sort of difference in his treatment of such questions before and since he became Cardinal. A shallow and ill-natured critic observed not long ago, in reference to his strong comments on some of the wild vagaries of "Mariolatry" exposed in Dr. Pusey's *Eirenicon*—that "his red night-cap would be sure to preserve him from any more 'bad dreams.'" The remark was not more unmannerly than uncalled for. Never has the new Cardinal's studied moderation of tone—both in what he says and in what he leaves unsaid—been more conspicuous than in his recent address on the Conversion of England.

When we speak of the Cardinal's moderation of tone we do not mean merely that he discusses the possibilities and methods of the conversion of England to his own faith without any invectives against Protestantism generally or against the Church of England. That is true of course, and all who know anything of his character and writings would have assumed beforehand that it would be so, while they would no less clearly understand that this moderation of temper does not in his case arise from coldness or indifference. As he has himself observed in one of his Oxford Sermons, "It costs nothing to be dispassionate when you feel nothing, and to be benevolent and considerate when you have no principles and no opinions." But it is not always so easy to cultivate such dispositions when you have very decided convictions and feel keenly about them. The first point, however, to which we desire to call attention here is not so much what may be called the controversial fairness and sobriety of Cardinal Newman's address, as his calm and balanced judgment in handling points on which sincere religious believers of very opposite schools, Roman Catholic or Protestant, are apt to be fanciful and extravagant. There is probably no living theologian, as has already been intimated, who has a firmer—we might almost say more passionate—hold on the dogmatic and supernatural principle in religion; yet it would be difficult to bring out more distinctly than he does here, as in many previous publications, the necessity of recognizing—to use theological language—the due relations of Nature and Grace. In the brilliant volume of *Discourses to Mixed Congregations* which he published four or five years after his great change, some of the most eloquent passages are on this subject; and so again, in his Lectures on *University Education*, he draws out with all his singular fertility of thought and expression a kind of Athanasian Creed of natural theism, antecedent to all details of revelation. It is in the same spirit that he here urges on his coreligionists the need of defining to themselves precisely what they mean, and what they ought to ask for, when they pray for the conversion of England. Is it a conversion of the State, or of the nation, or of the people, or of the race, and from what to what? In former days such prayers had a very definite meaning. "To pray for the triumph of religion was to pray for the success in political and civil matters of certain Sovereigns, Governments, parties, nations." And thus "in England Catholics in the sixteenth century would pray for Mary, and Protestants for Elizabeth." But their prayers can have no political drift now; it may indeed be questioned if they did wisely to desire such assistance then, or if it profited them much when for the moment their petitions seemed to be granted:—

> Queen Mary did not do much for us. In her short reign she permitted acts, as if for the benefit of Catholics, which were the cause, the excuse, for terrible reprisals in the next reign, and have stamped on the minds of our countrymen a fear and hatred of us, viewed as Catholics, which at the end of three centuries is as fresh and keen as it ever was. Nor did James II. do us any good in the next century by the exercise of his regal power. The event has taught us not to look for the conversion of England to political movements and changes, and in consequence not to turn our prayers for it in that direction. . . . I think the best favour which Sovereigns, Parliaments, municipalities, and other political powers can do us is to let us alone.

But still, he argues, it is necessary to have some present and tangible object for our prayers, both for our own sakes, and because we are else very likely "to irritate those for whom we pray," as though there were some secret and underhand design against them. Only we should be careful—and this is the point specially insisted on—to be "satisfied with ordinary acts of Providence," and not to ask for miracles. Of Cardinal Newman's firm belief in the miraculous there can be no shadow of doubt, and therefore his language on the subject is the more telling and significant:—

> What I would urge is this: the Creator acts by a fixed rule, which we call a system of laws, and ordinarily, and on the whole, He honours and blesses His own ordinance and acts through it, and we best honour Him when we follow His guidance in looking for His presence where He has lodged it. Moreover, what is very remarkable, even when it is His will to act miraculously—even when He outsteps His ordinary system—He is wont to do honour to it while overstepping it. . . . For the most part His miracles are rather what may be called exaggerations, or carrying out to an extreme point, of the laws of Nature, than naked contrarieties to them; and if we would see more of His wonder-working hand we must look for it as thus mixed up with His natural appointments. As Divine aid given to the soul acts through and with natural reason, natural affection, and conscience, so miraculous agency, when exerted, is in many, nay, in most cases, a co-operation with the ordinary ways of physical nature.

It is, then, only our duty, the Cardinal argues, "if the Almighty thus honours His own ordinances" in the natural dispensation of things, to honour them too, to take likely rather than unlikely objects of prayer, and not to say, *e.g.*, of this or that particular person whose conversion we have set our heart on, "We will have him," as though we held "that doctrine of the Hindoo theology represented in Southey's poem, that prayers and sacrifices had a compulsory force on the Supreme Being." In short, those who pray for the conversion of England to the Catholic Church mean, or ought to mean, to pray for "the growth of the Catholic Church in England," and that by ordinary, not miraculous, means:—

> They would look for the gradual, steady, and sound advance of Catholicity by ordinary means, and issues which are probable, and acts and proceedings which are good and holy. They would pray for the conversion of individuals, and for a great many of them, and out of all ranks and classes, and those especially who are in faith and devotion nearest to the Church, and seem, if they do not themselves defeat it, to be the objects of God's election; for a removal from the public mind of prejudice and ignorance about us; for a better understanding in all quarters of what we hold and what we do not hold; for a feeling of good will and respectful bearing in the population towards our bishops and priests; for a growing capacity in the educated classes of entering into a just appreciation of our characteristic opinions, sentiments, ways, and principles; and, in order to effect all this, for a blessing on our controversialists, that they may be gifted with an abundant measure of prudence, self-command, tact, knowledge of men and things, good sense, candour, and straightforwardness, that their reputation may be bright and their influence wide and deep; and, as a special means and most necessary for our success, for a larger increase in the Catholic body of brotherly love and mutual sympathy, unanimity, and high principle, rectitude of conduct, and purity of life.

To such prayers and aspirations on the part of their Roman Catholic fellow-countrymen no Protestant can reasonably object; with a good deal of what is suggested, indeed, every reasonable man would concur. Nor could Roman Catholics well do or desire less consistently with loyalty to their own belief. But the Cardinal's moderation of tone is equally remarkable alike in his limitation of the objects to be desired, and of the methods by which they are to be sought. We can readily imagine that there were those among his audience who would have preferred a very different kind of exhortation, and who must have felt themselves hit hard by that characteristic reference to "the Hindoo theology" of the *Curse of Kehama*. And there are many hot-headed religionists of a very opposite persuasion who might profit by such weighty and sound advice. Thus only the other day a Dublin Correspondent of the *Record* devotes half a column to denouncing and deploring the culpable apathy of his co-religionists in "simply letting Roman Catholics alone," instead of straining every nerve for "their conversion to the true faith of the Gospel." "Cannot," he indignantly exclaims, "God the Holy Ghost convert Roman Catholics? Is not the means He uses for that purpose the Gospel? Is not the duty of preaching that Gospel to Roman Catholics just as clear as that of preaching to the heathen? And if the Church persists in neglecting this duty, what can she expect? What but chastisement, humiliation, and defeat?" Cardinal Newman is no doubt quite as earnest as this Orange apostle in his desire for the conversion of outsiders to what he considers "the true faith of the Gospel"—though he does not suggest that Protestants are no better than heathens—but they differ *toto cœlo* in their ideas of how that desire may be most piously and profitably acted upon. To the Church of England the Cardinal makes no reference in his lecture, and this silence is in itself significant. He had spoken of it in former works as "a serviceable breakwater" against errors worse in his opinion than its own, and had expressly disclaimed any desire for its overthrow. In his address at Rome last year he specified, as a menacing sign of the times, the combination of hostile sects "to oppose the union of Church and State and advocate the unchristianizing of the monarchy and all that belongs to it," and he spoke of their possible success as "a catastrophe." There can be little doubt that in this matter his mind remains unchanged. He has no desire to promote the interests of his own creed by means which he would regard as suicidal. He is anxious of course for the advance of the Roman Catholic Church, and would be very glad to see it once more dominant in England; he notes with satisfaction the progress it has actually made of late years—mainly, if the truth must be told, through the influence of his own teaching and example—in the goodwill of his countrymen, and to some extent in numerical strength. But he cherishes no fond dream of a speedy or miraculous triumph; he looks for success only to orderly action on "the free will of our countrymen," and to "the majestic march, and slow but sure triumph of truth and right in this turbulent world." And meanwhile he does not contemplate training the minds of his countrymen for the acceptance of what he deems that fuller truth by shaking their hold on such truths—however presumably inadequate—as they already hold. He would be thankful indeed to witness what to his apprehension is the only perfect vision of "peace," but he is not prepared to "make a solitude" in order to clear the way for it. If such large-hearted and large-minded views were more common among leaders of religious thought than they are, we do not say that the triumph of Rome would be nearer, but all would have cause to rejoice who look forward to the prevalence and steady advancement in the world of charity, of concord, and of truth.

NURSES AND DOCTORS.

OF late years a great deal of attention has been given to the care of the sick, and even if the subject has not assumed the proportions of a "fashionable mania," it has been felt that nursing is a suitable employment for educated women, and that it opens a career which, though requiring a special training, is not only not derogatory to them, but is one in which delicacy and refinement are peculiarly requisite. This movement, which may be said to have begun in the Crimean War, has been steadily growing, and has led to the formation of various sisterhoods and schools for nurses, sometimes connected with some particular form of religious belief, and sometimes not. It was not likely that the public hospitals of this country would long remain unaffected by the movement, more especially as it was generally felt that there was room for improvement both in the character of the staff and in the regulations. Accordingly in several of these institutions new nurses have been secured superior to their predecessors in education, training, and social position, and new rules have been introduced which, while carefully arranging for the rest and recreation of the attendants, are yet of a very strict disciplinary character in all matters affecting the welfare of the patients. It was of course impossible that changes of so much magnitude, affecting the interests and positions of the various officials, should take place without a good deal of controversy, and every one will remember the dispute which arose at King's College Hospital in consequence of the Governors of that institution objecting to the nursing of their patients being undertaken by the St. John's Sisterhood, not on the ground that it was ill done, but that the Sisterhood was not entirely under their control. In that case an appeal was made to the subscribers and the public at large, who decided in favour of the nurses. We understand that the result fully justifies that decision. At Guy's Hospital, however, where differences have arisen which have caused much ferment in medical circles, the disagreement has been between the visiting medical staff (who wish to preserve the old order of affairs) on the one side, and a reforming matron on the other. In the month of October last a new matron was appointed, who had had long experience in a similar position at Leicester, and, with the approval of the Treasurer, who is responsible for the general management of this hospital, she made changes which have proved so unpalatable to the visiting staff that they have made them the ground of a formal complaint to the Governors. When we mention what some of these changes are, they will not, we think, appear wholly evil to the lay mind. The nurses are for the future forbidden to wear long earrings or gaudy ornaments, or to prepare or eat any food in the wards; they have to wear a uniform cap and apron; and they are at intervals moved from ward to ward for the purpose of increasing their experience. They are no longer divided into separate classes for day and night work, but all take their fair share, which is desirable both because the strain on their health is less under this arrangement, and because it was found impossible to secure the services of superior women for night nursing alone. Facilities are also afforded for lady pupils to increase their efficiency by attendance at the hospital. We are not surprised to learn that these changes commend themselves to the resident physician, a man who, to quote Dr. Moxon (himself among the strongest opponents of all change in these matters), is "the best living authority on hospital management." Indeed, if things have come to a "crisis," it must clearly be from some other cause than the radically vicious nature of the alterations; some may suppose it to be want of tact on the matron's part, some may set it down to pique on that of her opponents. To judge which of these two views is the true one, it may be useful to know what has been the opinion of the Governors in the matter. Now the Governors of Guy's are, as Dr. Moxon says, "princes, bishops, nobles, statesmen, financiers"; they have gone carefully into the charges preferred by the doctors against the matron; and though it must be evident to every one that the natural disposition of a body of men of this kind without special knowledge would be to support the complaining experts, the fact is that they have decided almost, if not quite, unanimously in favour of the matron, on the ground that the complaints against her were either frivolous or unproved.

With affairs in the state we have endeavoured to describe, "the relations" being "very much strained" between the matron and the doctors, and nothing but the inherent solidity of the venerable institution preserving it from the fate of a house divided against itself, an article appeared in the *Nineteenth Century* from the pen of Miss Margaret Lonsdale. If it was intended as an attempt, in return for benefits conferred, to pour oil on the troubled waters, it has certainly proved a failure. Much allowance ought undoubtedly to be made for a young lady who has just published a book that has run through seven editions, and who is asked to supply a paper on a kindred subject to a popular periodical. Nevertheless we dare say that Miss Lonsdale would now be the first to acknowledge that she acted indiscreetly, not to say ungratefully, in availing herself of the generous permission of the hospital authorities to study nursing under their roof, and then, without their sanction, using the knowledge thus gained to draw a highly coloured picture of the faults in the management existing there till within the last few months. Though we are constrained to say that Miss Lonsdale, considering her position, ought never to have written the article above referred to, and though the violence with which she attacks a certain class of women suggests rather youth than charity in the writer, nevertheless we are glad it has been done, as it has given the public an opportunity of learning the truth about matters in which they have a great interest, and which it is very important should not be settled in a corner. In calling her article "The Present Crisis at Guy's," Miss Lonsdale was peculiarly injudicious; had she but realized the safety of generalities, and chosen a humbler if less attractive title, she might have escaped the triple attack which her own editor, after the treacherous fashion of the present day, has let loose on her, and the *Contemporary* of this month might have been without the verbose fulminations of Dr. Moxon. This gentleman's contribution to the pretty quarrel is indeed extraordinary, whether we consider the violence of the writer's tone or his inability to combat the difficulties of his mother tongue. Whatever may have been the lady's sins in the matter of acrimony, the Doctor has certainly bettered the example. Such words as "discompliment" and "a slant eye," and the description of St. Thomas's as a "handsome elaborate byword," will, we think, justify our criticisms on his style, while the following sentence, taken from the same source, is at once offensive and obscure:—"Miss Lonsdale should, when she wishes to wound, always take care that she does not enlist the conscience of her victim on his own side; thus would she reach a greater refinement of cruelty." After this specimen of his writing, the reader will perhaps be surprised to hear that the *Spectator* pays Dr. Moxon a compliment on his literary attainments. It would, however, be but of little moment if the strong bias which influences Dr. Moxon only interfered with his power of expression; unfortunately, it also prevents his taking proper care to ascertain the accuracy of his facts. Thus he puts the following query with a view to depreciate the quality of the nurses now at Guy's:—"Is not the new Matron now engaging *domestic servants* for nurses on the 'new system' and applying to the Registry Office for them?" We have unimpeachable authority for answering this question in the negative. Not only is there no necessity for such a course, but the authorities are receiving frequent applications from such places as the Leeds Infirmary to be allowed to send nurses to Guy's to be perfected in their duties. There is another matter in this article that is calculated to mislead, and that is the frequent quotations from an "official account" by the Resident Physician. Now one of the latest acts of the Governors has been to pass an order forbidding any of their staff to write to the public press on hospital affairs, and it would be, to say the least, surprising if Dr. Steele should so promptly have run counter to their wishes. Our information justifies us in asking whether it is not true that Dr. Steele has made no official statement whatever. Again, Dr. Moxon is desirous of showing that the class of Sisters under the old system was sufficiently high, and to this end he quotes the cases of six ladies of good birth and education as having "recently" left in consequence of the matron's action. Of these we learn that the last three had left some four or five years before the new system was introduced; that the Sister said to be "discharged on account of her religion" was removed because she declined to comply with the general regulation that the Sisters should read prayers in the wards; and that one of the remaining two ladies was dismissed in accordance with a recommendation from the former matron. Arguments based on such untrustworthy data as the above can carry but little weight, and we regret that Dr. Moxon was not more precise in his inquiries before giving publicity to their results.

The article of Sir William Gull in the *Nineteenth Century* is, as might have been expected, free from such faults as these, and the asperity with which he rebukes the lady's somewhat pert positiveness is quite justifiable. What is particularly to be noticed is that on the points with which the public are concerned he is by no means entirely at variance with her. One of Miss Lonsdale's principal complaints against the old system is that people were placed in the position of nurse who had not received proper training, and had previously fulfilled for a few months the humble post of scrubber or ward-maid; whereas nowadays no woman is considered qualified to be put in charge of a patient till she has been a probationer for two or three years, and has regularly studied all the details of nursing. On this subject Sir W. Gull says very decidedly and with perfect candour:—

> Hitherto there has been but little selection of proper persons to become nurses, and it is a matter for congratulation that the authorities of our large hospitals are alive to the pressing importance of this matter, and are willing to make arrangements for both the selection and the training of such women. Any action in this direction will be not only in the interest of the patients of the hospital themselves, but also in the interest of the public at large.

And later on he mentions that he has himself been pressing on the authorities of Guy's to prosecute the movement for making the Hospital available as a training college for nurses as it already is for students, and expresses his fear lest the manner of Miss Lonsdale's remarks should hinder the very cause she has at heart. After this no one can help feeling that, though Miss Lonsdale may have somewhat exaggerated the evils of the old system, and though it may be perfectly true that Guy's in particular has for a long while and on the whole been well conducted, yet the general aim of the new system to improve the tone and training of our nurses is highly commendable, and that it is much to be regretted that the visiting doctors should be found in opposition to it.

It has been very sensibly said that no reform is wholly good; and so it is in the matter of nursing. It is very natural that, in proportion as the Sisters are drawn from a higher grade of society, are more

intelligent, and, in fact, more fit for their duties, a desire should arise on their part for greater independence. As Miss Lonsdale herself admits, "It is a real and not merely an imaginary danger that highly-trained nurses are more likely to be tempted to overstep the just limits of their position"; and we certainly consider that a nurse's proper position is one entirely subordinate to the doctor's, and that her duty is to ask his advice and follow it on any point on which she may be in doubt as to his views. It is impossible that a good doctor should be unacquainted with the details of the management of the sick; and it is, as Sir W. Gull says, a fundamental error to arrogate for any system of nursing sources of knowledge not derived from the medical profession. We feel on reading such a sentence as the following—"A doctor is no more necessarily a judge of the details of nursing than a nurse is acquainted with the properties of certain drugs"—that Miss Lousdale is carried away by her desire to give due weight to the importance of nurses so far as to unduly curtail the sphere and responsibility of the doctor. Sir W. Gull indeed goes so far as to say that it is a poetic fiction to suppose that women have an inherent fitness for nursing; but we cannot help thinking that the majority of mankind will still take Sir Walter Scott's view, and prefer the attentions of a lady to those of the most "quietly zealous" medical students, provided they are sure the lady is acting under the direction of a doctor, and not carrying out "the evolution of nursing to a higher level" according to her private ideas. There is this, too, to be said as to the subordination of hospital nurses to doctors—that a nurse can only be expected to carry out the instructions of the particular doctor who attends her patients; she has not to swear a vow of obedience to the whole profession, including students; and we can cordially sympathize with the irritation with which Miss Lonsdale speaks of boarish lads coming in at all hours, making a litter, and generally disturbing the economy of the wards. It is true that Sir W. Gull is directly opposed to this view, and considers that "the quiet zeal evinced by the students is one of the most pleasant and useful influences in a hospital"; but the public, who, we regret to say, have not the most exalted idea of medical students as a class, are not unnaturally a little sceptical as to the advantage to the patients of allowing these young gentlemen to wander at their own sweet will through the wards in search of knowledge, and will not, we think, at the first blush admit the "absurdity" of Miss Lonsdale's proposition that the nurses should at times have a right to exclude the students from the wards. It is no doubt desirable that medical students should have the advantage of studying the phases of disease and the effect of remedies in a large hospital, but the public have a right to demand that, while no hindrance is thrown in the way of gentlemen or lady pupils acquiring useful knowledge, the interests of the patients for whom the hospital was founded and for whose sake it is kept up should be the first consideration with the authorities.

LOSS OF THE *AMERICAN*.

ALL who have read the accounts of the foundering of this vessel must have learnt with peculiar pleasure that her gallant commander was amongst those saved by the barque *Emma Herriman*. Under the most trying circumstances Captain McClean Wait's conduct was marked by perfect coolness and judgment, and, with the knowledge that his vessel must almost inevitably sink, he seems to have taken all possible measures with admirable foresight, and to have shown no more flurry or anxiety than if a trifling accident had occurred. The incidents of the loss, it is true, were not nearly as terrible as those of most famous shipwrecks have been; but nevertheless a tremendous responsibility rested on the Captain, and there was much that might have shaken the nerve of a less strong and capable man. The story of the foundering of his vessel is a singular one. After experiencing a heavy gale in the Bay of Biscay, she had, it seems, good fortune so far as regarded weather, and was getting near the Equator, when, on the morning of the 23rd of last month, the propeller shaft suddenly gave way, smashing, apparently, through the pipe and tunnel which surrounded it, and through the side of the vessel. The screw raced furiously for a short time and then stopped. The water of course rushed into the ship, and a brave effort which the third engineer made to get to the breach in the tunnel was unsuccessful. One of the officers was lowered over the stern, and it was ascertained that the propeller had "drooped" and that the stern post was bent, so that the vessel was utterly disabled so far as steam propulsion went. The water entering through what must have been a large opening, rose rapidly in the after hold. The pumps were immediately set to work, but the water continued to rise in spite of them; and the Captain, who from the first had shown perfect coolness and presence of mind, ordered that provisions and water should be put into the boats, and that they should be lowered. As it was clear that all the spare space would be wanted for these absolute necessaries, he refused, with commendable firmness, to allow the passengers or crew to place any bundles or packages in the boats. That there was scarcely any chance of saving the vessel must have been clear; but Captain Wait rightly judged that it would be some time before she would sink, and, considering no doubt that a good meal would keep up the passengers' courage, and that the store in the boats ought to be economized as much as possible, he sent them into the saloon to breakfast. This over, they got into the boats; and, inspired probably by the admirable example of the commander and his officers, showed praiseworthy firmness and self-possession, the embarkation being effected, according to one of the seamen, as quietly as though a pleasure-trip was in contemplation. Having thus assured, so far as was possible, the safety of his passengers, the Captain, who appears to have calculated the time of the ship's sinking as calmly as if he were making some everyday computation, called on the crew to make a last attempt to save her. They appear to have responded most willingly, and everything that could be done was done to keep the *American* afloat. Coals and cargo were thrown overboard, and the steam-pump, which had broken down, was set going; but all to no avail, for the water rose steadily, and the sea, which was getting up, made a clean breach over the quarter-deck. At 11.30 A.M., there being clearly no hope, the Captain ordered the men to take to the boats, and they obeyed with some alacrity, as may well be imagined. After they had all safely embarked, the Captain, left alone on board the sinking vessel, called on them to give three cheers for the ship. They did so; and then, having done all that was possible to preserve life and to save the property of the owners, and having obeyed a noble tradition as a frigate captain of the old time might have done, the commander at last consulted his own safety and left the *American*, which shortly afterwards sank.

The fact that all were thus able to escape from the ship was, of course, due in the first place to her being properly provided with boats. Of these there were eight, some of which were apparently large ones. In spite, however, of there being quite enough of them to hold the crew and passengers, and in spite of the considerable time which elapsed between the accident and her sinking, there might have been on board one of those painful scenes of panic and confusion which have so often occurred at shipwrecks, if it had not been for the excellent organization which prevailed. As was to be expected with such a captain, all the boats were kept ready for work, and during the voyage the crew had been regularly drilled at boat service, so that when the order was given to lower the boats, every one knew what to do, and, without any kind of confusion, they were lowered as quickly as those of a man-of-war would have been. It has been stated that, within two minutes after the order was given, the boats were all in the water. The orderly way in which everything was done and the sight of the boats in the water no doubt tended to prevent any panic on the part of the passengers; but it is only fair to say that they seem to have shown unusual courage. The example of an intrepid man not in the least dismayed or bewildered by a great disaster, and of the subordinates who so admirably seconded him, had its effect on all. It is most gratifying to observe that there were none of those attempts by the seamen to save themselves, regardless of others, which have so often been made when passenger ships have been lost. The safety of the passengers was thought of first, and then the men did their best to save the ship. It is singular to contrast the order which prevailed on board the *American* when there were eighteen feet of water in the hold, with the scene that occurred some ten months ago on board a Channel steamer when one boat had to be lowered.

After the vessel had sunk, the little squadron under Captain Wait did not long keep together. At the time of the disaster Cape Palmas, the point of junction of the Ivory and the Gold Coasts, was some 250 miles distant, bearing about N.E. For this Cape the course was given by the commander, and a strong and favourable wind at first sent the boats quickly on their way. The first and second cutters and second lifeboat outsailed the other five so much that at dusk the latter were out of sight. The three boats were hove to for a short time by the chief officer, who was in command; but as the others did not come up, he determined to proceed on his course, and determined wisely, no doubt, as it is difficult to see that anything would have been gained by waiting. During the next day (the 24th) the three boats parted company, the cutters outsailing the lifeboat. At six the following morning land was made by the former, and, when near it, the cutters were picked up by the *Congo*, a homeward-bound steamer. The behaviour of Captain Liversedge, the commander of this vessel, was most praiseworthy. Placing a look-out at the masthead, he steamed about in search of the other boats, and at the end of an hour and a half picked up the second lifeboat. The search for the rest was continued during the whole night, lights being burned at intervals of half an hour. A twelve hours' quest having proved fruitless, the *Congo* resumed her course, and landed the shipwrecked passengers and seamen at Madeira on the 8th of the present month. Of the remaining five boats, three were picked up by the barque *Emma Herriman* on the 24th and 25th of April, and those who had been on board them were transferred on the 27th to the steamer *Coanza*, which took them to the port of Gran Bassa on the African coast. Of the other two boats nothing has yet been heard; but very possibly they have been picked up by some outward-bound vessel. A strange misfortune befell those who were landed at Gran Bassa. They embarked on the 1st of the present month on board the steamer *Senegal*, which made for the island of Great Canary. Off the coast of this island the vessel struck on a rock. She was got off, but it was ascertained that she would soon go down; so that for a second time within a few days the unfortunate travellers and mariners experienced the sensation of being on board a sinking ship. The vessel was run ashore, and those on board were saved, with one exception. Owing to some unintelligible clumsiness, one of the boats capsized when lowered, and was cut in two by the propeller. Mr. John Paterson, a member of the Cape Legislative

Council, was drowned, and another passenger had his hand and arm seriously injured. The remainder of those in the boat, however, were saved, and the shipwrecked passengers and crew made their way to Las Palmas, the capital of the island—not, of course, to be confounded with the town at Cape Palmas—from which place they were taken to Madeira by the steamer *Teuton*, a vessel belonging to the Union Steamship Company, which had received orders to touch at Las Palmas to see whether any of the passengers and crew of the *American* had been landed there. At the time of their arrival at Madeira some of them, as may well be imagined, were ill; but it does not appear that what had been undergone had in any case immediately endangered life.

The story of the double misfortune which befell them is made tragic by the lamentable death of Mr. Paterson, and, in spite of legitimate hope, the absence of tidings respecting the two missing boats is painful in the extreme. Happily, however, the account of the loss of the *American* is far from being altogether painful. The conduct of the Captain showed those high qualities which have been thought specially to characterize English seamen, and it is evident that the officers under him behaved admirably. None of the passengers gave way to unreasoning fear, and the seamen, fitly commanded, worked well and steadily to the last. It should be added that the vessel was properly found, the owners having provided her with boats enough to take away all on board in case of disaster; and indeed the only moral to be drawn from the loss of the *American* is that, since it is clearly possible for a passenger steamer to carry a sufficient number of boats, the owners of all passenger steamers should be obliged to equip their vessels properly in this respect, and that no further attention should be paid to the nonsense which is sometimes talked about its not being practicable to do so. Some other nonsense also may not impossibly be disposed of by the loss of the *American* and the *Senegal*. For a long time past, whenever the account of the launching of a passenger steamer has been described, it has always been pompously stated that the vessel was divided into watertight compartments, so that, if her skin was broken in any place, the water would enter one compartment, and that, with one or even more full, she would yet remain afloat. The *American* was supposed to be divided into seven of these compartments. Of what avail were they? The breaking of the propeller made a hole in one of them, and in spite of the pumps, the vessel gradually filled and sank. The *Senegal* was in all probability supposed to be divided into watertight compartments. Of what avail were they to her? The ship struck on a rock, and when she was got off was found to be rapidly filling. In how many of the accidents to great iron steamers which have happened of late years have the so-called watertight compartments prevented the ship from going down? It is quite possible that, owing to the necessities of stowage and of passenger accommodation, it may be impossible thus to subdivide a merchantman; but then the public should not be informed of a supposed security against danger which, as a matter of fact, does not exist. That the risk of foundering can be greatly diminished by the subdivision is indisputable; but in too many merchant ships, either the subdivision is insufficient, or else the bulkheads are not really watertight. It is absurd to place any substantial reliance on such precautions as are now taken, and it is much to be regretted that delusive statements should frequently be made. The loss of the *American* may do some good if it causes a wholesome scepticism as to the flourishing accounts which appear of the safeguards against foundering provided in great passenger steamers.

THE PICTURE GALLERIES.—III.

IN the general sketch which was given a little time ago in these columns of important works to be seen at the Royal Academy, most of the interesting pictures in the first gallery were specially mentioned. Some productions of particular merit, however, necessarily escaped notice. Among these are Mr. Oswald von Glehn's very graceful and tender "Œnone" (31), which the Hanging Committee have poked into a corner, where its merits are discovered only by pain and labour; and Miss Hilda Montalba's "Venetian Boy unloading a Market-Boat" (32), which fully deserves the good place assigned to it. The work is strikingly free and vigorous, both in drawing and colouring, and makes one hope very much from Miss Montalba's powers. M. Mesdag's "Night; Scheveningen" (38) is a fine effect, strongly represented; and Mr. Fahey's "I'm Going a-Milking" (50) exhibits very favourably the artist's capacity for seizing and interpreting the tender, half-pathetic moods of Nature. What kind of thing Mr. Frith proposed to himself to seize or interpret in his staring, commonplace picture of a "Tenby Fishwoman" (58) it would be idle to inquire. No doubt the work will be admired, just as the vulgarest novels find the largest number of readers; and it is to be feared that it must be long before there is any widespread hesitation in gratifying the demand for that which is liked solely by reason of its common and shallow nature. In this room there is one picture, Mr. Peter Graham's "Highland Drove" (26), which we have already mentioned, but which can be looked at again and again with increasing pleasure. The spectator who is fortunate enough to know and love the Highlands is at once carried into them while he looks at Mr. Graham's marvellously painted cattle and at the light which seems almost to shift and change before one's eyes on the hillside. Amongst other works not yet mentioned in this gallery we may direct special attention to Mr. Magrath's very clever picture, "In the Green Fields of Erin" (72). In the second room Mr. Barrett Browning, whose versatility appears to be not the least of his merits, exhibits a very clever and humorous portrait of a pig under the title "Watching the Skittle-Players" (102). The players are out of sight, so that the attention is left free to concentrate itself on the representation of their audience. The "Race to Market, Tahiti, Society Islands" (115), by Mr. N. Chevalier, is a fresh and original picture, full of sunlight and movement. The attitude and look of the dog in one of the racing canoes is a happy touch. Mr. Arthur Lemon's "Cattle in the Roman Campagna" (120) surely deserved a better fate than that of being "skied." For his picture of "Sunrise, Waterloo Bridge" (118), Mr. John O'Connor has chosen as a motto Wordsworth's magnificent lines:—

> The river glideth at his own sweet will,
> Dear God! The very houses seem asleep,
> And all that mighty heart is lying still.

In saying that the choice is justified by the painting of the picture we give the artist the very highest praise. Mr. Leslie's "All that Glitters is not Gold" (131) is curiously vicious in style. The rustic is such a rustic as has never been seen out of a stage crowd while the "supers'" dresses have still the gloss of novelty, and the whole picture is as irritatingly smooth and clean as the interior of a prison. Mr. Boughton's "Evangeline" (139) is in itself a charming picture, but the motto—

> When in the harvest heat she bore to the reapers at noontide
> Flagons of home-brewed ale—

is a trifle unhappy, since the one quality which is not present in the picture is that of heat. We return, with renewed pleasure, to the "Sister's Kiss" (142), painted by the President. The natural beauty of the pose, the delicacy of the colouring, the elasticity of the principal figure, and the sense of free open air that pervades the picture, all combine to make it, as we have before said, a work of extraordinary beauty. The line of pictures amongst which it occupies the most prominent place seems to have been arranged with an unusual and welcome attention to the effect of colour which may be obtained by judicious hanging; and Mr. Perugini's pretty and graceful "Siesta" (150) aids in a marked manner the pleasing general result. In "Follow my Leader" (155) Mr. J. A. Storey has found again the attractiveness which seemed to some extent wanting in his last year's pictures. The subject is eminently pleasing, and it has been treated with fine and skilful appreciation. Mr. Alma-Tadema's two fine works in this gallery (176, 195) have been already spoken of.

In the third gallery a prominent place is held by "Victoria Regina" (217), by Mr. Wells, a picture purporting to represent the Queen receiving the news of the death of William IV. The first thing which, to borrow a French phrase, "leaps to the eyes" of one who looks at this picture is that the kneeling figure would, if he stood upright, be about fifteen feet high. Consideration of the unpleasant colouring and the stiff woodenness of the whole composition may follow upon contemplation of this. Amongst other works in this gallery to which we have not yet called attention we may notice Mr. Aumonier's very pleasing landscape of "Oxford" (223), Mr. Parsons's "October Evening" (222), and Mrs. Perugini's clever picture of a child in distress over "Multiplication" (231). Beyond these we come to the President's "Light of the Harem" (256), the beauty of which seems somewhat marred by its curious pallor, to a striking picture by Mr. Blashfield, "The Roman Ladies—a Fencing Lesson at the Gladiatorial School" (251), and to a strangely and unhappily careless work by Mr. Hook, "Sea-pools" (261). Other important pictures not yet referred to are Sir John Gilbert's finely studied and coloured "King Henry VI." (275), Mr. Marcus Stone's "Amour ou Patrie" (282), and Mr. Briton Rivière's "Night Watch" (298). This is a curiously impressive picture. The solitude of the place, the grandeur of the columns rising against the night sky, the stealthy prowl of the lions, who are the only living and moving things in the picture, and the bright light reflected from their watchful eyes are all given with admirable feeling and fidelity. This is certainly one of the best pictures that Mr. Rivière has produced.

The fourth room contains one of the two finest sea-pieces of the year, "Britannia's Realm" (387), by Mr. Brett. This is a wonderfully fine rendering of a wide stretch of calm, open sea dotted with sails. The freedom, the vigour, and the impressiveness of the work are in the highest degree remarkable. Mr. Brett has perhaps never painted any better thing. In this gallery hang also Mr. Frank Holl's effective, if somewhat conventional, picture, "Ordered to the Front" (366), and Mr. Long's "Portrait of Mr. Irving in *Hamlet*" (416), in which the general impression of Mr. Irving's conception of the part has been seized and rendered with a feeling and skill which more than atone for a slight shortcoming in the matter of likeness. Mr. J. D. Watson's "Corporal Trim" (375) is an admirable work, illustrating a pathetic incident in a simple, straightforward, and touching manner. Mr. Seymour Lucas has a clever *genre* picture, "Drawing the Long Bow," and Mr. Vicat Cole exhibits an excellent landscape, "On Silver Thames" (393). Mr. G. H. Boughton's "Our Village" (338) is marked by the peculiar and quaint charm which the artist has the secret of giving to scenes and incidents which might easily appear commonplace. M. Chierici's "Desperate Venture" (349), a picture of a child taking its first walk surrounded by its relations, deserves praise for its feeling as well as for its technical skill.

We take this opportunity of noticing Mr. Henry Blackburn's excellent *Academy Notes* and *Grosvenor Notes* for 1880. These handbooks, admirably arranged and got up, are at once pleasant records and, to the critic condemned in the case of the Academy to take in as much as he can of a vast exhibition in a few hours, valuable helps to memory. We fail to see why Mr. Frith's "didactic" series of pictorial anecdotes, called "The Race for Wealth," which happily is not exhibited at the Royal Academy, should be included in the *Academy Notes*. One other point in them seems to compel attention. "This picture," Mr. Blackburn writes of Mr. Orchardson's "Bellerophon" (262), "is the only work of importance of which no sketch has been received for *Academy Notes*." It is, no doubt, a humorously practical comment upon this deplorable fact that the sketch given is so minute as to be all but indistinguishable from the letterpress into the centre of which it is thrust.

THE OPERAS.

It was evident from Mr. Gye's announcement at the beginning of the season that he had determined to rely upon the "star" system for success. This mode of proceeding, however much it may be to the benefit of the management, is undoubtedly greatly to the detriment of the quality of the Italian opera. To depend upon one or at most two good singers for each opera performed, supported by others far from efficient, and a chorus but indifferently trained, would be certain in any other country than this to meet with condemnation; but the English public are patient and thankful for the little they can get. The stars that Mr. Gye brings forward this year are not numerous. Mmes. Albani and Patti and M. Lassalle are expected to carry the whole burden upon their shoulders, unless Signor Gayarré is to be counted among the luminaries. Under these circumstances it is not to be wondered at that no novelties are produced, and that some only too well-known operas are repeated *ad nauseam*. It remains to be proved whether this mode of proceeding will end in success or not; for if it does succeed, we may expect next season to have a still inferior class of secondary performers, and after that still worse, until at last it will become necessary to advertise the precise time at which the star appears on the stage, so as to allow those who care to do so to come in to hear the only part of the opera that is worth listening to.

In Gounod's *Faust e Margherita* Mme. Albani this season "stars" as Margherita with Signor Gayarré as Faust. After her two years' absence from the operatic stage, it is not to be wondered at that her performances should be a matter of great interest to the public. The part of Margherita, liable as it is in the hands of an inferior artist to degenerate into one of mere sentiment, is a genuine test of the higher powers and dramatic instinct of the performer, and acquires an interest paramount in the representation of the work. With a really good Margherita we may almost put up with an indifferent Faust. And so it was on the occasion of Mme. Albani's first appearance this season. From the time when Margherita enters in the Kermesse scene to the time when she throws herself upon the straw pallet in the dungeon, Mme. Albani's rendering of the part is uniformly excellent. In the garden scene the contrast produced by her singing of the plaintive ballad while she is spinning and the childlike delight depicted in the jewel song immediately after was very effective, and the last longing look she gives at the jewels in the casket before closing it at the appearance of Faust and his friend was very near perfection. No less admirable is her acting in the scenes of deeper emotion. Her misery at her brother's death, her shame and remorse in the awful cathedral scene, and her half insane and wholly pitiful utterances in the prison were all very forcibly given. It is the more desirable to call attention to the histrionic merits of this performance because of its welcome contrast in this respect to the indifference too often shown by singers to the dramatic side of opera. For instance, when Faust sees Margherita at his feet after her avowal of her love for him, Signor Gayarré, instead of making some attempt at acting, turns himself almost insultingly away from her and shouts his part to the audience. The illusion of the piece is gone, and with it, of course, much of the interest. Of Mme. Albani's singing it is not necessary to say anything more than that it calls for as high praise as does her acting. Mlle. Pasqua took the part of Siebel and sang it with credit. Faust was allotted to Signor Gayarré. It is a pity that, with such a voice as this singer possesses, which he used to such advantage in "Salve Dimora," he should not be able to discriminate between singing and shouting. His straining at the higher chest notes has anything but a pleasing effect with respect to intonation. The Mefistofele of Signor Vidal deserves praise as an interesting impersonation; but his voice, especially in the lower register, is quite unequal to the size of the house. A little more of the devil and less of the abject coward in the scene with Valentino and chorus in the second act would be preferable. Nevertheless his byplay is very effective, and his acting throughout conscientious. Signor Cotogni, who sang much below his usual mark, was the Valentino, and Mme. Ghiotti Martha. The ludicrous and irritating change of scene at the end of the first act still obtains, we regret to say. It is difficult to conceive any stage device more monstrously absurd and out of place than the wretched pantomime effect. It only remains for the stage-manager to arrange a harlequin exit through a clock face for Mefistofele, and an entrance on a sloto for Margherita, amid coloured fires.

The appearance of Mlle. Turolla as Valentine, in *Les Huguenots*, for the first time in London, attracted a large audience. Mlle. Turolla gave a very creditable and pleasing rendering of the heroine's part, and in the last act—or, rather, the third act, which ended the opera on this occasion—she showed herself possessed of some tragic power. Her voice is of a sympathetic quality, with considerable flexibility. To Mlle. Schou was assigned the part of Margaret of Valois, which she played rather with the *naïveté* of a schoolgirl than with the stateliness of a queen. Her voice is a soprano of a tender quality, and will doubtless in time gain the power which it now lacks. Mme. Scalchi played Urbano, the page, and as usual sang excellently throughout the part. Raoul fell to Signor Gayarré, who showed no further sign of being an actor than he did as Faust; whilst Nevers was entrusted to Signor Cotogni. It is perhaps hard to expect every one to raise the part of Nevers to a leading position, and perhaps Signor Cotogni never dreamed of doing so; but there are possibilities in it, and some singers have taken advantage of them. Signor Cotogni, we suppose, did not attempt to give it any force, but accepted it as a minor *rôle*. Signor Vidal's Marcello, like his Mefistofele, is a good rendering, but with the same disadvantage of voice which we before spoke of. By no means an inconsiderable impersonation was the St. Bris of Signor de Reszke, who may some day be heard of in a greater part. In Meyerbeer's operas the chorus naturally plays a very prominent part, and it is therefore necessary that it should be well trained and efficient. This may be considered a mere detail; for, provided the chorus asserts itself boldly in noise, it is supposed that the public are satisfied; but we wonder what the public would have thought of the unaccompanied "Rataplan" chorus had the orchestra suddenly sounded the true notes about halfway through. The effect, we do not hesitate to say, would have been unique.

Verdi's *Il Trovatore* is so general a favourite with "country cousins" that a full house may nearly always be counted upon, and on its first performance this season we were not only promised a new tenor, but found that M. Lassalle was to take the part of the Conte di Luna. The house, however, was not so large as might have been expected, owing perhaps to the fact that some had found out that M. Lassalle was not going to sing. Much disappointment and dissatisfaction was openly expressed that the change in the programme had not been made sufficiently public, and that no reason had been assigned for it. With a season devoid of novelty in its *répertoire*, the management might surely attempt to avoid adding such disappointments as this to the load of dulness which the patient public is obliged to bear. To Mlle. Alwina Valleria fell the part of Leonora, and the way in which she performed it deserves every praise. She is a valuable acquisition to Covent Garden both as singer and actress. The Azucena of Mlle. Pasqua was also a very good impersonation, and her rendering of the music allotted to her artistic. To pronounce an opinion at a first hearing upon a new tenor is not, to our thinking, either just or permissible, and we should like to hear M. Engel once at least again before doing so. An operatic artist's *début* is perhaps a more trying ordeal to undergo than that of an ordinary actor, and we can at least congratulate M. Engel upon having gone through it with credit. A pure tenor voice nowadays seems to be more and more of a rarity, and people, considering such a thing almost impossible, have agreed to accept the nearest approach to it they can find. M. Engel's voice is of that quality which would justify its being classed either as a tenor or baritone, a kind of voice not at all rare, especially with the French. He is certainly not a tenor of the first rank, although he possesses a few very telling high notes. Of his rendering of the part of Manrico it may be said that he knew perfectly well what he had to do and did it intelligently. There was nothing startling in his reading, which is perhaps the very best thing that can be said of it, except that he appeared to be master of the stage, a rare thing, as we have already observed, with tenors at Covent Garden. An excess of tremolo in his voice, arising perhaps as much from nervousness as from anything else, will, we hope, be avoided in his subsequent performances. Should his further appearances confirm our opinion, we shall, although not hailing him as a star, be very thankful that he has been added to the staff of the Royal Italian Opera. Signor Graziani played the Conte di Luna, a part familiar to him. A little excitement was caused by a certain section of the audience vigorously demanding a repetition of "Il balen," while another section was nearly as energetic in making a counter demonstration. Applause gained the day, however, and Signor Graziani had to repeat the song, which he did very tamely indeed. Why the *encore* was demanded is and always will be, a mystery.

M. Lassalle was, of course, the centre of interest in *Un Ballo in Maschera;* and, although Mlle. Turolla was announced to sing the part of Amelia, she was replaced without notice by Mlle. Montilla—another disappointment inflicted by the management on the public. The part of Renato, the generous friend of the Duke Riccardo, who repays him by trying to estrange his wife from him, was very ably sustained by M. Lassalle, who gained the applause he deserved for his magnificent singing. With his superb baritone voice he combines artistic skill of the highest order, both in singing and acting. This, the only male "star" Mr. Gye has favoured us with, is veritably a brilliant one.

"Alla vita che t'arride," in the first act was admirably given; and the scene in the third act where Renato comes to warn the Duke of a conspiracy, and finds him with a lady, whom he promises to conduct to the city gates, and who proves to be his own wife, was acted in a most masterly manner. As a piece of tragic acting, also, it would be difficult to surpass M. Lassalle's in the fourth act, where Renato's wife begs to be allowed to see her child before she dies. Mlle. Montilla's impersonation of Amelia was praiseworthy, and her singing pleasing. Mme. Scalchi, as the fortune-teller Ulrica, sustained her well-merited position as a first-rate singer and actress; and Signor Carpi, as the Duke, and Signori Scolara and Capponi, as Angri and Armando, fulfilled their parts with credit.

The first performance to which we can give almost unqualified praise this season was that of Wagner's *Lohengrin*, with Mme. Albani as Elsa. It is difficult to speak too highly of her rendering of the part. As the forlorn maiden, championless until a miracle produces the Knight of the White Swan, the tender-hearted princess who shelters the revengeful Ortrud, the bride at once joyful and full of doubt, and, at last, as the despairing victim of Ortrud's hatred, Madame Albani was magnificent. We have seldom seen an actress so thoroughly throw herself into the part she has undertaken, and, without fear of overpraising, we can say that she gives as fine a reading of Herr Wagner's conception as has been vouchsafed us on the London opera stage. Especially excellent was Mme. Albani's singing of "Aurette a cui si spesso," when she appears in the balcony in the second act, and "Tu non conosci," a little later on, when she rebukes Ortrud for doubting Lohengrin; and the expression of rapturous love that comes over her face as she reiterates the words "sua sposa" in the same scene, almost defies description. Mlle. Pasqua showed that she had given great pains and much study to the difficult and disagreeable part of Ortrud, and the subtle hatred and pent-up revenge of the insulted woman were finely depicted. Signor Gayarré was for once electrified into acting, and his propensity to shout did not find that opportunity which has been given it in the other operas that he has played in this season. His address to the swan in the last act was really fine, and the whole of the music of the bride-chamber scene was feelingly rendered by him. Signori Cotogni and Silvestri rendered valuable aid in the respective parts of Telramund and the King, and Signor Capponi sustained the arduous part of the Herald with credit. We must take exception to Signor Vianesi's reading of the magnificent entr'acte music at the opening of the third act. It was never intended to be galloped through as an unmeaning fanfare of trombones, and by his disregard of the tempo, or his unnecessary haste to get to the end of the opera, Signor Vianesi came very near ruining one of the most remarkable pieces of orchestral display in the whole work. With this exception, the representation of *Lohengrin* was one worthy of the largest opera-house in the United Kingdom.

M. Lassalle's known success as Nelusko last season made it a certainty that before long *L'Africaine* would be produced at Covent Garden. It may be said shortly, as of the racehorse Eclipse, that Nelusko was first and the rest nowhere. As usual at Covent Garden, the scene on board ship, save for the mast which stands in the centre of the stage, might be on dry land. There is nothing else to indicate that Don Pedro is afloat, and it might be an improvement if a large placard were fixed to the above mentioned mast, stating that what is taking place is supposed to be on board a Portuguese man-of-war.

Signor Vianesi conducted the orchestra on each occasion. In the delicate expression of variations of piano and forte we are sorry to say the orchestra is not strong, and, owing perhaps to its size, the loud passages are so loud that we are inclined to pity the singers on the stage, who are supposed to make themselves heard above the din of the instruments that intervene between them and the audience. A little more care and a judicious adaptation of his sound power would greatly improve Signor Vianesi's band.

Year after year the public have to put up with the intolerably bad libretti supplied to them within the walls of Covent Garden. A moderately accurate book of the words at least might be expected, but even this is not granted, and as if to add insult to injury a most despicable translation in a language scarcely recognizable as English is foisted upon the unwary purchaser. The whole book, it may be added, is most atrociously printed. Surely it would not be hard to have this matter rectified, especially as people seem quite willing to pay for a good libretto.

If anything was required to prove that the "star" system is a mistake from an artistic point of view, it would only have been necessary to be present at Her Majesty's on the opening night. We may congratulate Mr. Mapleson that he has not followed the example of his rival, Mr. Gye, for, taken as a whole, the performance of *Faust* at Her Majesty's was incomparably better than that which we have already spoken of at Covent Garden. With Mme. Christine Nilsson as Margherita, Mme. Trebelli as Siebel, Signor del Puente as Mefistofele, and Mr. Maas—the only true tenor we have heard this season—as Faust, this favourite opera was scarcely likely to fail. Of the first two singers it is hardly necessary for us to speak, as their capabilities are already too well known to need description, and criticism has always been and can only be laudatory; but of Signor del Puente's Mefistofele we must say a word or two. And first, to touch upon a mere matter of dress, at the risk of being thought hypercritical, let us implore Mefistofele to procure another and less absurd feather for his cap. This feather, which looks like an overstrained pair of pincers, is almost as annoying as M. Maurel's celebrated gas-flame which he substituted for it in the cathedral scene; nay, perhaps it is more so, as it is ever present. Signor del Puente's impersonation of the character is good all round, however, except for an unpleasant fidgetiness which he exhibited when he was imprisoned in the absurd cage provided for him in the cathedral scene, owing perhaps to an over anxiety about the manipulation of the red light upon him. Mr. Maas, who, as we have already said, is the only real tenor we have heard this season, has a future before him. He gained a well-deserved success on the opening night, and gave promise that he intended to maintain it. Gifted as he is with the true tenor quality of voice, he has given careful study to enhance its charm, as is evident from the vast improvement in his vocalization and phrasing even since last year. He has perhaps not given sufficient attention to action, but that will come. Signor Mario, we have always understood, had the same difficulty to overcome, and latterly he was perhaps a finer actor than a singer. Perhaps one of the greatest charms of Mr. Maas's singing, always excepting the fact that his voice is one of those rarities, a tenor proper, lies in his not straining his voice "to split the ears of the groundlings," which shows him to be a true artist. He can sing an upper C without the brazen or even reedy effect that is so common in many so-called tenors of this day, and we fervently hope that he will never condescend to shout at the audience after the manner of Signor Gayarré. The chorus at Her Majesty's requires strengthening and weeding. It was really painful to listen to the first chorus in the opera on this night, both as to time and vocalization, in spite of the praiseworthy efforts of Signor Arditi and his electric bell. We may however congratulate Mr. Mapleson on his choice of a successor to Sir M. Costa's *bâton* in Signor Arditi, and we are pleased to find that he has given the public a chance of hearing an opera by Wagner under the conductorship of Herr Richter.

REVIEWS.

HOWORTH'S HISTORY OF THE MONGOLS.*

THIS is "a second instalment" of Mr. Howorth's ponderous *History of the Mongols*. It is in imperial octavo, and in small type. The first volume, of which a notice was given in the *Saturday Review* of October 21, 1876, contained nearly eight hundred pages. This second volume, in two parts, has more than a thousand pages, and the work is not complete; how much there is yet to follow does not appear. As we observed in our former notice, it is a book for reference, not a book to read. It is a mighty maze, and possibly may have a plan, but this is not conspicuous. The style is diffuse and wearisome. If the author had practised "the art to blot" more freely, he would have done more credit to himself, and made his book more agreeable to his readers. But in the matter of style he disarms his critics by a candid confession:—

> Style I profess in this work to have none. In some places, where perseverance has almost succumbed under the load of monotonous detail, I feel on reading the phrases again as if they had been written in the unsophisticated days of early school life, when style and punctuation were both contemned. It has been as much as patience and vigilance could secure that the narrative should be intelligible; and in many places where the pen would willingly have run riot, where a little poetry might have been scattered among the phrases, the temptation has had to be sternly resisted, for fear the facts should be distorted, and lest what is necessarily a very compressed narrative should swell over untold volumes.

We may assure the writer that his work has not suffered from over-compression; but we would gently ask him if the author of such a book is justified in that utter disregard of style which he so ingenuously acknowledges. One critic, he says, "has complained that his style has not the majestic ring of Gibbon, or the easy flow of Macaulay." We should be content if, *longo intervallo*, he showed any of the merits of those great writers. Few authors attain great excellence of style, but men of only moderate pretensions should strive after some felicity of expression, and might avoid such Irishisms as "traversing the arid steppes of Asiatic history and tracking out the rivulets and streams." To Mr. Howorth's unwearied perseverance and industry the highest commendation is due. He has brought together from many sources an immense amount of information; and, if he is content to have amassed this vast store and to wait for one to come after him "who can epitomize and point the moral of the whole story," we can only hope that he may meet the reward of his labour, and have, as he desires, "the satisfaction, which some say is worth living for, of having done his best at what his hand found to do."

The first volume was almost exclusively filled with the life and conquests of Jingis Khán. This ruthless conqueror possessed all the virtues and vices of his race in a pre-eminent degree; and his genius dominated all who fell under his influence. A born warrior, he not only conquered wherever he marched, but he infused into his generals and soldiers such confidence in their invincibility that victory attended their banners even when he himself did not take the field. The empire which he had conquered was too vast and heterogeneous to be held together by hands less powerful than his

* *History of the Mongols, from the Ninth to the Nineteenth Century.* Part II. The so-called Tartars of Russia and Central Asia. By Henry H. Howorth, F.S.A. London: Longmans & Co.

own. He foresaw this, and divided his possessions among his four sons:—

> These divisions subsisted long, and were all feudally subservient to the senior house. Then they broke asunder. Then each one disintegrated into smaller fragments, and eventually into still smaller. . . . . All these sections, great and small, were ruled by princes of the sacred caste, and had an aristocracy of the same descent. Jingis Khan was the fountain of all their princely houses, while the upper castes, equivalent to the upper and middle class with us . . . were also, in the main, of Mongol descent. They belonged, in the language of the Kazaks, the proudest and most illustrious of robbers, whose polity is the most democratic of oligarchies, to the class of white bones; while those whom they led and taught and commanded belonged to the class of black bones.

The present volume, or Part II., as Mr. Howorth calls it, deals with "the so-called Tartars of Russia and Central Asia." At the death of Jingis Khán, in the year 1227 A.D., when his empire was partitioned among his four descendants, the territory which fell to the share of Júji, his eldest son, was the *dasht* or steppe of Kipchak. Júji died before his father; but his eldest son, Orda, received his father's share. It comprised the country lying north of the lower course of the Jaxartes, the Sea of Aral and the Caspian, with the rich countries on the Don and Volga, and part of those on the Black Sea. Orda held the greater part of these territories, and was the titular head of the house. But Batu Khán, his brother, took the western parts, and acknowledged only a nominal feudal dependency on his elder brother Orda. This Batu was an enterprising chief. He penetrated into Central Europe, subdued Hungary, conquered all the country as far as the Carpathian mountains, and established a suzerainty over Russia. That division of the race of which he was the head was known to the Western world as the Golden Horde, a name which it derived from the great gold-emblazoned tent which was set up for the dwelling of the chief in the Ordu, or camp. Mr. Howorth says this word *ordu* is "equivalent to the German *hort* and the English *horde*"; it is rather perhaps the original of these words. To Englishmen the word is well known in another sense, as the name of the Hindustani language, which is called Ordu or Urdu from having sprung up in the camps of the Mahomedan conquerors. The Golden Horde experienced some vicissitudes, and in the last quarter of the fourteenth century it received a stunning blow from Timur, or Tamerlane. This conqueror was of pure Mongol descent, but the people of his tribe from long residence in Turki countries had become Turks in manners and in language—that is, Eastern Turks, who must not be confounded with the Osmanli or Western Turks, whose Sultan Bajazet was so signally defeated by Timur. After this the Golden Horde gradually decayed, and, suffering several secessions, it dwindled down into the small Khanates of Kazan, Astrakhan, and Siberia, which were finally absorbed by Russia in the sixteenth century.

The main interest of the present volume centres in the information which it supplies respecting the rise of the Russian Empire, for, as Mr. Howorth says, "It is assuredly an interesting inquiry to analyse the conditions under which such a community as that of Russia was moulded." At the time of the Mongol invasion Russia consisted of a number of feudal principalities paying only a nominal allegiance to the over-chief, the Grand Prince of Moscow. They were unable to make any effectual resistance to the overwhelming hosts of the invaders. The country was trodden under foot. Havoc, destruction, and slaughter marked the course of the conquerors, who were accustomed, as Sir Thomas Browne says, "to treat human beings as flies, and to convert whole nations into wildernesses." But the land of Russia proper had few or no attractions for a nomad pastoral race. Its forests and swamps were unsuited to their mode of life. They withdrew to the Ukraine and the grass plains beyond the Dnieper. What might have happened if they had established themselves in Western Russia can only be conjectured, but when they retired, Europe certainly escaped from an awful danger. The Mongol invasion nevertheless had a great influence on the population of Russia. Here as elsewhere the Mongols asserted their superiority, and the white-boned race largely recruited the ranks of the upper classes. Some colonies which occupied the grassy valleys maintained a separate existence and assimilated but slowly with the neighbouring peoples. Ivan III. and Ivan the Terrible were the Tzars who extended their dominion over the decaying power of the Mongols and Tartars, and

> probably carried the autocratic theory of government more completely to a logical conclusion than it was ever carried before. Russia in their hands became in fact a mere multitude of abject slaves subject to a most tyrannical master, who crushed out and destroyed the old aristocracy, while almost every trace of municipal and social freedom disappeared. The servility which had been exacted by the Mongols was transferred to the Tzar and his officials; all power was directly dependent on himself; birth, reputation, wealth, were of no influence when in opposition to his whim, and every trace of liberty was uprooted. Serfdom was introduced, the peasant was tied down to the land, and the whole nation by an ingenious hierarchy of officials was made a mere machine, of which the key was in the hands of one irresponsible person, and during one long reign in the hands of a madman and a monster.

A long period of stagnation followed the consolidation of Russia. Ignorance and social degradation everywhere prevailed. The whole land was shrouded in darkness and crushed under the heel of a brutal despotism. At the end of the seventeenth century rose Peter the Great. He first gave Russia a place among the nations of Europe. He no doubt failed, as Russian historians confess, in many of his designs. The soil of Russia was unprepared for the civilization of the West which he sought to transplant. He gave the country, however, what was more important to its material welfare, an outlet to the outer world. Up to his time the Russians were enclosed on every side by hostile neighbours. On the south the Crimean Tartars barred the access to the Black Sea. "In the west and north-west the Swedes and Danes, the Livonian and Prussian Knights, and the Germans created a cordon of fiscal and other barriers, which absolutely closed all ingress and egress for the arts and humanities except through the narrow portals of the Hanseatic league." The discovery of the entrance to the White Sea by Englishmen in the sixteenth century had a great influence on the prosperity of the country, and, as Mr. Howorth observes, no other proof is needed to show the thorough isolation under which the country suffered. Peter forced his way to the Baltic and the Sea of Azoff, and at the end of the last century Catharine completed his work in the latter direction by the conquest of the Crimea. The desire for a more extended seaboard still animates their successors. Peter's desire to be near the civilization of the West led him to found St. Petersburg, and to commit what Mr. Howorth considers "was perhaps the greatest blunder of his life." His desire for a capital in proximity to the sea, through which the culture of the West might penetrate into his benighted empire, made him overlook the great disadvantage of placing the heart of the country in an extremity instead of in its midst. Mr. Howorth sees some hope in the future for the people of Russia and its "ignorant, happy-go-lucky, servile, drunken peasants"; but he says very truly that little good is to be expected from the sudden introduction of parliaments, juries, self-government, and other institutions of older and more advanced communities. Some advance has, he says, been made. He thinks even that

> The Russian race is immensely altered, and that the metaphorical Tartar apostrophized by Voltaire is no longer the prominent feature in it. We shrink no doubt from many of the characteristics of Russian public life, from its Oriental system of diplomacy, from the atmosphere, tainted with corruption, in which its bureaucracy lives, the want of genuine patriotism among its masses, the crass ignorance of its people, and the degraded position of the Church in its rural districts. We would see these things disappear, and we believe they are disappearing, and that a genuine leaven is gradually leavening the lump.

It is to be hoped that these opinions are well founded, but they derive no obvious confirmation from current events.

Mr. Howorth has his word to say upon the views of Russia in the East. He is content to see her "stamping on the incorrigible robbers of Asia," for there she may even effect an improvement; but "her foot is heavy, and few daisies grow where it has trod. When Russia annexes a province, it ceases to be a part of the world's common capital of culture and wealth." He shows that the eyes of the Russians have long been turned with desire to Constantinople; and Tzargorod, the "City of the Tzars," as they call it, was an object of ambition long before the time of Peter. The possession of this point of vantage would be tantamount to "freezing up one of the most important channels the world possesses." The Slavs of the south are much in advance of the Slavs of Russia; and, though they have many things in common, their interests and feelings are too adverse for the realization of the dream of Panslavism. The union of the southern Slavs under the rule or protection of Austria gives promise of the growth of a power able to bar the progress of Russia to the south.

A study of some parts of this bulky work would undoubtedly help to a more thorough understanding of the great question of the time. No true judgment can be formed of the prospects of a nation without a fair knowledge of the peculiarities of the people. Race, habits, qualities, antecedents, all need to be scanned as carefully as the great facts of history. The book before us contains abundance of such information, and it is much to be regretted that no assistance is given to those who would seek it. Perhaps it is too much to ask for an index to an unfinished work; but we may well complain that it has no table of contents, no list of chapters, no entry of dates in the head-lines—in short, none of those helps to reference which save time and spare the temper of the seeker. There is an infinite number of divisions, consisting of a bewildering succession of personal memoirs. He who would consult the work on any particular point will be lucky if he finds what he wants without a long and irritating search.

LETTERS FROM FRANCE IN 1789.*

THE publication of these letters scarcely stands in need of the justification offered in the opening lines of the preface. It has been truly said that there are some great events or scenes in history of which the world will never tire. Such are Waterloo, the French retreat from Moscow, and the first French Revolution. It is with the last of these three that these "unstudied letters" deal. Dr. Rigby, the father of Lady Eastlake who edits this volume, was born in 1747, and with three other gentlemen—Mr. Boddington, Mr. Morgan, and Mr. Woodhouse—undertook what was intended to be a pleasure trip in the summer of 1789. That Dr. Rigby was in politics and aspirations a Whig of the old stamp we can readily believe; but his sympathies with a vast community struggling to make head against oppression seem now and then to have led him, like others of the same creed, into anticipating somewhat more permanent and peaceful successes than events justified. We shall consider his letters under two main

* *Dr. Rigby's Letters from France, &c., in* [illegible] Edited by his Daughter, Lady Eastlake. London: Longmans & [illegible] 1880.

aspects. First, we have the incidents of travel, ordinary and even commonplace, but so attractive to those who in this generation can almost remember the change from sailing-packet to steamer, and from lumbering diligences, *malle-postes*, and *estafettes* to express trains. We all feel a pleasure in realising the annoyances and discomforts to which travellers like ourselves were put just a century ago. And, next, there is the account of what the four Englishmen never anticipated but had to witness at Paris in the famous week of July 1789 which began with Sunday the 12th of that month. We do not intend to convey the impression that any such marked division naturally characterizes Dr. Rigby's letters, addressed collectively to his first wife and two daughters long since deceased; but we cannot help drawing the distinction between the experiences of a mere tourist and the materials supplied by the same person as an eye-witness for the revision of the historian.

On Friday morning, July 3, the four travellers found themselves on board a "very neat vessel," properly fitted up for passengers; and it is gratifying to learn that, weighing anchor (as we interpret the letter) about 6 A.M., they set foot on shore at Calais by noon the same day. They went to the "Silver Lion," an hotel which we think must, in later days, have been eclipsed by those of Dessin and Rignolles. Here the dress of the French girls, the muscularity of the lower orders, the bad beer, the excellent Burgundy, the boys bathing, the fine strong soldiers, all furnish matter for comment. Leaving Calais at six in the morning, they got to St. Omer by ten—not bad travelling, seeing that their five horses and one mule accomplished about seven miles in the hour—and they reached Lisle at eight. They seem to have made a short stay at this town, at Douai, and at Cambray, to have passed through the forest of Chantilly, "the undisturbed residence of deer, wild boar, pheasants, and all kinds of game," and to have got to Paris on the evening of Tuesday the 7th. They travelled in a landau; and in this part of the trip may be said to have had quite as good a time of it as fell to the lot of many travellers so late as the year 1830. When they got away from Paris, having witnessed scenes which ought to have considerably modified the Whig doctrine of the perfectibility of Parisian nature, they halted at Fontainebleau, slept at Auxerre, and, as we read it, at Dijon, Châlons, and Macon also; and, after a very bad dinner on some freshly slaughtered pigeons at St. Albers, reached Lyons on July 23rd. In this town Dr. Rigby found much more to admire in the Hôtel-Dieu than in the theatre, where the "performance was execrable, the actors bad, and the singing wretched." A bargain was next concluded with a "rascal of a boatman" to take the party down the Rhône to Avignon. This impudent fellow asked eighteen louis and took nine. It may be in the recollection of many readers that steamers used to make this charming trip down stream, between the above-mentioned two places, in a single day, except when the boat happened to run on a sandbank, or was detained by a fog or want of water, in which event the luckless passengers were landed and put up in some *cabaret* on the banks for the night.* The Roman remains at Vienne, so well described in Dumas's *Impressions de voyage*, if we remember aright; the irregular mountain ranges of Grenoble; the dirty streets of Avignon, with its Papal palace not yet converted into a huge *caserne*; the celebrated aqueduct at the Pont du Gard, and the *Maison Carrée* at Nismes, are all described or touched on with intelligence and taste. The high tower, or phare, just above the last-named town is called an "ancient gazebo," which hardly accords with our recollections of the building. Marseilles and Toulon are next brought before us; and here a touch of the Tory Englishman of that school which a few years afterwards was taught to hate frogs and Buonaparte comes out in the praises bestowed on a dinner *à l'anglaise*. It consisted of "plain roast beef and boiled potatoes, with some special good draughts of porter." The change from the landau of France and the boatmen of the Rhône to what is obviously the *vetturino* system of Italy was not, in Dr. Rigby's eyes, a subject of commendation. The roads were good, and the *Cornice* a "wonderful" work; but stinking inns and cheating landlords were hardly compensated for by the sight of picturesque towns that seemed to "hang in air," as the hamlets do in Macaulay's Lays, and by fertile and well-watered plains full of corn, and chestnut, mulberry, and beech trees. Turin was the furthest point reached in Italy, and this town also is characterized as filthy, and full of ecclesiastics, soldiers, and beggars, that swarmed under an arbitrary and bad Government. From the capital of Piedmont it was then, as now, easy to reach Geneva by the Mont Cenis and Chambery, at which place there were some pretty women, and sundry of the French runaway *noblesse*. Chambery was no cleaner than Turin. The inevitable *char-à-banc* took the travellers to Chamouni by Sallenche; and the ascent to what Dr. Rigby calls the *Montagne Vert*, since corrupted into Montanvert, was accomplished with no more difficulty and danger than "moderate perseverance" could overcome. Then comes the familiar trip to Martigny by the Col de Balme, to Bex, to the cascade beyond it—which is no doubt very picturesque, but bears a most unsavoury title—and to Vevay and Lausanne, where we have references to Rousseau and "Mr. Gibbon's House" and his History. The travellers went by Berne, Basle, and down the Rhine in a boat to Cologne and Düsseldorf. They found time also to get to Amsterdam, the Hague, and Helvoetsluys, which place they left on Sunday, the 6th of September, at four in the afternoon, "in Captain Flynn's packet," to be taken off by a fishing-boat, after a bad passage, and landed at Yarmouth some time on the 9th of the same month. It must be obvious that such a correspondence is mainly valuable because it shows what a man above his age in intelligence and sympathies thought of a neighbouring country just about to take its first leap in the dark.

Lady Eastlake, with some slight perplexity, endeavours to reconcile her father's enthusiastic descriptions of French agriculture, comfort, and cheerfulness, with the misery that unquestionably preceded the cataclysm of 1789. To read some of Dr. Rigby's descriptions, the French people were enjoying an almost incredible degree of social prosperity. Never was there such a rich country or such a splendid climate. Every acre had been brought under the plough or the spade. Even Chantilly was a charming place. Vines were luxuriant where nothing else would grow. The extent of agricultural development was only rivalled by the healthiness of the population, by the industry of the tillers, by the succession of agreeable scenes, by the smiling and contented faces of the people. The very reverse of all this was observable in Germany and Holland. The Low Countries were wide wastes and the people stupid. The German towns had no trade. The Elector's gardens showed no taste. The public buildings were daubed over with red ochre; the towns were barren of entertainment; the postal service ill-managed; the officers of Government were boorish and uncivil, and so forth. How far this amazing discrepancy between one kingdom and another, between the sham France of the letters and the real France of the historian, may be due to Dr. Rigby's desire to get to his journey's end, or to the good harvest of 1789, which at last came after several bad years, or to political sympathies, which may have coloured the landscape, purpled the vine, and given a bright tint to wheat and barley, we do not care to determine. But revolutions are stern facts, and we have too often compared records of travel with the reality to put implicit trust in cursory estimates of the capacity of a country or the character of its people made from the box of a landau. When the late Mr. James Wilson arrived in India in 1860 to set right the finances, he literally broke out into ecstasies on beholding the cultivation of the Doab of Hindostan, and inferred the capacity of the Punjab to produce everything and to bear lots of taxes. He had seen nothing like that in Belgium. Yet a very few months must have taught him that India was a poor country, and that a grower of tulips in the Netherlands was a very different person from a Punjabi ryot. Again, in the Orissa famine of 1865-6, parts of the Lower Provinces of Bengal seemed outwardly as flourishing as ever, with teeming rice-crops far as the eye could reach, while there were withered stalks and stunted herbage in the next district or division, and people had begun to die of starvation. Lady Eastlake's pardonable attempts to vindicate her father's character for sagacity merely prove to us the extreme danger of accepting hasty generalizations even when made by travellers whose intelligence and veracity no one would question.

But no such criticism can detract from the value of Dr. Rigby's narrative of the terrible days of that third week of July. We have taken occasion to compare the evidence of our eye-witness with the animated pages of Professor Smyth, Mr. Carlyle, and Thiers. The events of that crisis may be summarized as follows. On Saturday the 11th, it was known that Necker had been dismissed. On Sunday there was agitation, terror, tumultuous meetings, and, contrary to French custom, the theatres were shut. On Monday morning the 13th, the mine exploded. Prince Lambesc ordered his dragoons, the Royal Allemands, to fire on the mob; while the Garde Française fraternized with the latter, and the prisons were forced, all except the Bastille. On the 14th, Tuesday, the Bastille was taken, after a siege of some four hours. By Wednesday the 15th, the King withdrew his troops, and presented himself to the Assembly at Versailles. All Thursday the excitement still continued, and on Friday the 17th, the King entered Paris, and went to the Hôtel de Ville. During Saturday workmen completed the destruction of the Bastille by levelling it to the ground. But then things were more quiet, and Dr. Rigby and his companions, after divers perilous adventures, managed to get clear off on their journey to Lyons.

Dr. Rigby witnessed, on Sunday the 12th, that celebrated scene when Camille Desmoulins harangued the people in the Palais Royal. Mr. Carlyle describes the orator as springing to a table, "Sibylline in face, and in each hand a pistol." Thiers slightly varies this by saying that the popular speaker got on a table in the Palais Royal, pulled out his pistols, made a cockade of green leaves of trees, and called on the crowd to follow his example. We note that Dr. Rigby seems to have had no Sabbatical scruples about going to the theatre, for after attending church he had taken his seat at the Théâtre Français, when he was told that there would be no performance, and that his money would be returned. But he was inexpressibly shocked and disgusted at the sight of two bloody heads raised on pikes in the centre of a frantic crowd rushing down the Rue St. Honoré. This was on the evening of the Tuesday, and it is a pardonable error that he at first imagined them to be the heads of the Marquis de Launay, the Governor of the Bastille, and of Flesselles, the Prévôt des Marchands. The unfortunate De Launay was mutilated, and his head exhibited as described; but the second head was that of M. de Losmes, the Commandant or Deputy-Governor of the prison. Flesselles was killed, it is true, at the same time, and both Mr. Carlyle and Thiers say that he met his death from an unknown hand. Our curiosity was here naturally excited to know whether Dr. Rigby saw any of the unfortunate prisoners who were dragged out of their cells and paraded through the streets when

the Bastille was taken. We do not find any mention of them in Thiers. This historian merely says that crowds rushed to the Bastille when it was thrown open, to find instruments of torture and deep dungeons, and to gaze with wonder on a huge stone and a big chain. Mr. Carlyle, following the *Moniteur* of the day, says in his peculiar vein, "Along the streets of Paris circulate seven Bastille prisoners, borne shoulder high; seven heads on pikes, the keys of the Bastille, and much else." This fairly accords with a sentence of Thiers:—"Le réglement et les clefs de la Bastille au bout d'une baionette." That Dr. Rigby, in the rush and stampede of the surging crowd, only made out two of the liberated captives, if they were all really paraded, does not of course detract from his credibility. It merely shows that even practical and self-possessed men cannot seize every incident in a tumultuous scene. He tells us he saw two victims; one a little, feeble, old man reduced to idiocy; the other a tall and robust figure, with eyes nearly closed, a high forehead, a long beard, and plenty of hair at the back of his head. Of the names of these two prisoners, Lady Eastlake tells us, we cannot be certain. The tall man was said to be Count Auche, and Dr. Rigby understood him to have been imprisoned for writing a pamphlet against the Jesuits. The *Moniteur*, on the contrary, gives the two names as M. Tavernier and M. Whyte. Readers of Mr. Carlyle may remember at this point an affecting quotation from a letter of one Queret-Demery, in which he begs earnestly for news of his dear wife. It was dated October 7th, 1752, but not discovered till the capture of the place. Dr. Rigby, who visited the place on the Saturday following its fall, and saw a number of artists taking drawings of "what from this time was to have no existence but on paper," would have appreciated our historian's humorous lamentation that he could find no plan of the building to aid him in his attempted minute description of outer and inner drawbridges, and portholes, and dungeons out of which old secrets came to view and long-buried despair found a voice. Dr. Rigby, we should state, had no small difficulty in getting clear of all this excitement and tumult. When he had obtained his passport, his carriage was stopped by the mob because he carried pistols, and arms were thought wholly unnecessary against robbers, as "there were none in France." The travellers were called "scélérats" and "noblesse," and hissed and hustled, and had it not been for a friend, Mr. Dallas, and for the opportune recognition of their man-servant by a woman in the crowd, who embraced the domestic as a long-lost brother, they might have experienced more annoyances than the dirt of a bad *auberge* or the impositions of an unconscionable landlord. It is noteworthy that Dr. Rigby hardly ever refers to his companions in any of his letters after the first mention of their names; he never attempts to be facetious; he is nowhere flippant; and his descriptions of a familiar country and a remarkable epoch derive additional interest because they are edited with the care, the good taste, and the accuracy to be expected from the hands of Lady Eastlake. We only hope she has retrenched nothing, but has given us every line that her father wrote.

GREEK COINS.*

WHILE Professor Curtius and his staff have been exploring the remains of the temples of Olympia, an English archæologist has set in order, and illustrated with the light of contemporary history, the monuments of the Eleans, presidents of the Olympic festival. It is happily no longer necessary to insist on the importance of Greek coins as elements in the history of art. The efforts of the indefatigable Keeper of Coins, and his scarcely less laborious staff of assistants in the Medal Room of the British Museum, have been rewarded by a considerable and daily increasing amount of public interest. Not many years ago it was a very difficult matter to obtain any comprehensive view of the numismatic treasures of the national collection. There were no official catalogues to be consulted, and it was thus impossible to study the coins anywhere except in their trays; and any one who has tried it must recognize the serious objections attending this mode of study. This state of things has now happily passed away. The contents of the Medal Room are rapidly being made known to the world at large by means of illustrated official catalogues, of which a dozen volumes have been published during the last six years, and in which the student may obtain a complete knowledge of the Greek, Roman, and Oriental series without ever visiting the Museum at all. It is true that these catalogues are not precisely easy reading, and are perhaps little fitted to serve as guides to the beginner; but they have given a stimulus to the whole study of numismatics, and have become the parents of a rapidly increasing series of more popular handbooks, which cannot fail to make their subjects interesting to a very wide circle of readers.

One of the best and most comprehensive of these handbooks is published in connexion with another great improvement in the popularization of the national collection. The difficulty of obtaining a satisfactory personal inspection of the coins themselves has at length been sufficiently met, not by an increase of the departmental staff, but by the perfection to which the art of making facsimiles of coins has been brought by the skill and science of Mr. Ready, the electrotypist to the Trustees. The coin-electrotypes made by Mr. Ready from casts of the originals are so precisely like the genuine coins that it is no rare thing for connoisseurs for a moment to confound the two. A fairly representative collection of the finest Greek coins, executed in electrotype, is not a very expensive thing, and many private persons, as well as public institutions and schools, have taken advantage of the facilities now offered by the Museum authorities for the purchase of "counterfeit presentments" of the choicest gems in their keeping; and there can be no doubt that the distribution of such collections over the country is doing much and will do more towards educating the popular taste. The Museum has led the way in the employment of electrotype copies of coins. After supplementing the ordinary exhibition of a portion of the actual collection in the Gold Ornament Room by four glass cases of electrotypes of Greek, Roman, and English coins, the combined energy of the Keeper of Coins and the new Principal Librarian has effected a very important addition to the King's Library, to which the public have daily access. By the side of a magnificent exhibition in the originals of the historical medals of the chief countries of Europe, two upright cases have been established, in which electrotype coins of all the Greek cities, from the beginning of the coinage to the Christian era, are exhibited in a clear chronological and geographical arrangement, which is fully explained in a Guidebook written by the Assistant-Keeper of Coins, Mr. Barclay V. Head, already known by his *History of the Coinage of Syracuse*, his *Coinage of Lydia*, and his official catalogue of the coins of Macedon. No more valuable work of its kind has appeared than this *Guide to the Greek Coins exhibited in Electrotype in the King's Library*. The whole subject of Greek numismatics is here luminously expounded. The fine series of typical coins is divided into seven periods, characterized as the period of archaic art, that of transitional art, of fine art, and so on through the periods of gradual decline to that of decease—extending altogether from B.C. 700 to the Christian era; and Mr. Head describes the characteristics of each period (giving references to contemporary examples in sculpture) in a short, clear introduction, before proceeding to the minute description of each individual coin. These introductions are the most valuable part of the work. They enable the student to take in the general principles of Greek numismatics, the gradual development of the plastic art in Greek hands, and the resemblances, and still more the contrasts, to be discovered between coins and sculptures of the same time and the same locality. To one who has mastered these introductory chapters and traced the working out of their principles in the cases of electrotypes in the King's Library, the theory of Greek coin-art is no longer a secret; and he should be able with very little additional study to assign any fresh coin he meets with to the period to which it belongs, and to group a collection in its true order. The seven beautiful photographic plates which illustrate the *Guide* are another instance of the aids which the last few years have placed at the service of the numismatist. Nothing more perfectly representative of the originals can be conceived. A photograph is taken from the plaster-of-Paris casts of the actual coins by the autotype process, and is then transferred to stone, from which impressions are drawn by ordinary lithographic printing. The result is practically a photograph of the original coin, which, if not always quite so clear and decipherable as a line engraving, is absolutely trustworthy and not less permanent.

One may now, for a very inconsiderable outlay, possess a really beautiful collection of the finest examples of Greek art as developed by coin-engravers, or, failing this, one may study such a collection in the King's Library of the British Museum with Mr. Head's *Guide* in one's hand; and yet there is something wanting. The student, and even the ordinary art collector, needs the help of a systematic history of the Greek coinage—a general account of the issues of each city, in which not only shall the leading characteristics be broadly set forth, but the most minute details explained, the reasons assigned for each ornament and symbol, and every aid that ancient history and archæology can afford brought to bear upon the subject. Such a work Messrs. Trübner are endeavouring to provide for the Eastern section of coin-students in the *International Numismata Orientalia*, which, whilst professing to be little more than a "new edition revised and enlarged" of Marsden's great work, will in truth form an encyclopædia of Oriental numismatics such as no country of Europe has yet produced. But the student of Greek coins has no similar encyclopædia to refer to. The name of Eckhel is above depreciation, but the greatest works may become obsolete; and the more recent Mionnet is extremely unsatisfactory. The most important additions to the science of numismatics have been buried in obscure *Transactions*, *Zeitschriften*, and *Mémoires*, whence it needs no ordinary patience and bibliographical knowledge to exhume them. The British Museum Catalogues, full as they are of learning and research and scientific arrangement, make too severe demands upon the reader's attention and previous knowledge to answer the purpose we have described, and they labour under the necessary disadvantage of being restricted to the specimens preserved in the Museum. What is wanted is something less exclusively special and national—not merely numismatic, but more widely archæological—not English alone, but European. The writer of such a work must be acquainted with the contents of the

* *Guide to the Greek Coins exhibited in Electrotype in the King's Library, British Museum.* By Barclay V. Head, Assistant Keeper of Coins. (Published by Order of the Trustees.) 1880.

The Coinage of Elis. By Percy Gardner, M.A., late Fellow of Christ's College, Cambridge. (Reprinted from the "Numismatic Chronicle.") 1880.

museums of Europe and with the labours of all his predecessors; and he must treat the whole from the wide standpoint of art, and not from the narrower view of the special numismatist.

We are glad to learn from the pages of the *Numismatic Chronicle* that such a work is actually in process of publication. A small number of scholars, chiefly, it would appear, belonging to the staff of the British Museum, have arranged to prepare a series of monographs on the coinages of the various cities of Hellas, each of which shall form, as it were, a chapter of a New Eckhel—such at least is the ambition of the writers—and the whole, when completed, shall form a full and sufficient history of Greek coins. All the museums of Europe will be referred to, and photographic plates will be added. The value of such a work is indisputable. The only difficulty in such cases is to carry the plan through. Comprehensive treatises to appear in detachments in the Transactions of learned Societies are apt to collapse in the third or fourth number. The present scheme, however, promises to escape the common fate. The first part has already appeared, and its merits are sufficient to give an impetus to the whole series. It treats of a particularly interesting section of Greek coin-lore—the coinage of Elis—and it is written by Mr. Percy Gardner, who has won a high reputation by his official catalogue of the Seleucid coins in the British Museum, and his treatise on the issues of the Kings of Parthia for the *Numismata Orientalia*. *The Coinage of Elis* is a good beginning for the "New Eckhel." It includes some of the best examples of the great period of Greek art, and it adds to the artistic a distinct historic interest. Mr. Gardner, if he is a little unsympathetic on the artistic side, does full justice to the historical. His first object, he says, "is to treat numismatics in strict subordination to history. The history of every community treated of will be divided into periods, and to each period will be assigned its proper coins. This has already been done by Mr. Head in the case of Syracuse; and it is our purpose to treat other cities upon the same plan, if at less length. The fact is that—thanks especially to the English numismatists, as well as Dr. Imhoof-Blumer and M. Six of Amsterdam—it has during the last few years become possible to determine with far greater precision the dates of coins. We can usually arrange all the series of money issued by a Greek city in chronological sequence without much risk of a very serious nature, except in details. Thus, for the first time, the history of a city and its coins can be placed, so to speak, in parallel columns, each of which can be called upon to support the other; or, in some cases, the testimony of coins may refute that of the ancient historians; and thus order and system will be brought into the confused chaos of coins cited by Mionnet, and many side-lights will be opened on the connexions of cities and provinces."

Acting on this principle, Mr. Gardner divides the coinage of Elis into fifteen periods, of which the more important from an artistic point of view are the first seven, which carry the coinage from B.C. 471 to the Macedonian supremacy. We have nothing here to do with the early days before the Dorian invasion—the "Return of the Heracleidæ"—when Elis and the Olympian cult were under the control of the people of Pisa, a city hard by the sanctuary of Zeus. When the Dorians conquered the Peloponnesus, Elis was given to their ally Oxylus and his Ætolians, between whom and the old sovereigns of the country there was constant feud; the Pisatæ endeavouring to hold their own against the encroachments of the invaders, who had established themselves in the fortress of Elis, "to the north of Olympia, at the spot where the Peneus breaks forth from the Arcadian hills." Three times did the people of Pisa recover their old supremacy and the coveted presidency of the Olympic games. But the Eleans each time won back their conquests; about B.C. 570 Pisa disappears from history for a while, and the prosperity of the people of Elis begins and grows; and, "under their presidency, the games gained wider and wider fame, until they were one of the chief bonds which held Hellas together, and until the great deity of Olympia was recognized as the Father of the Gods and of Hellenic men."

As every analogy would lead us to expect, this Father of Gods and Men appears throughout the coinage of Elis in every variety of symbol and portraiture. It was under two aspects that Zeus was worshipped at Olympia. On the one hand, he was "the God of Sky and Weather," on the other "the Lord and Giver of Victory." The former is the common aspect among the Greeks. "Both in Messenia and Arcadia Zeus was worshipped on lofty hills, the spots of earth which are most tempest-beaten and most often shrouded in cloud. On Mount Ithome, Mount Lyceius, Mount Olympus, the cloud-compelling deity sat enshrouded in mist, uttering a voice of thunder, and sending out lightnings to lighten the world and rain to refresh it. On a late coin of Ephesus we have a representation of Zeus thus seated on Mount Prion pouring rain on the city of the Ephesians. Such a character also attaches to the most primitive Zeus of Greece, the god of Dodona, who dwelt amid the stormy hills of Epirus, and whose priests, the Selli, slept on the ground, and washed not their feet." In this aspect we find Zeus represented on the coins of Elis by the thunderbolt, which occurs almost continuously throughout the series; but unfortunately offers little opportunity for the artist's genius. The eagle, too, when it occurs alone, may be taken as a natural symbol of the Cloud-gatherer; but when, as is often the case, it is struggling with a serpent, or tearing a hare, it is rather a type of the second aspect of Zeus, as the God of Victory; for the appearance of an eagle carrying its prey to an army in battle was an omen of victory, as we learn in the eighth and twelfth books of the *Iliad*. Mr. Gardner has a great many interesting suggestions and hypotheses to offer about these symbols of Zeus, in many of which—as, for example, the identification of the Ionic column, upon which the eagle sometimes rests, with the *meta* of the racecourse—there would appear to be much reason. The most appropriate of all symbols of Zeus, however, is the figure of the goddess Nike, the personification of Victory, who soon appears on the coins of Elis, at first running to crown a victor; afterwards, standing or seated, in repose. She is the Victory of the Olympic games, not the Victory of common warfare, and carries the wreath of wild olive which was the sole but sufficient reward of the victor in the games. Lastly, we have Zeus himself portrayed upon the coins, sometimes seated on a throne, or mountain, with the "Bird of Jove" flying beside him; sometimes standing erect, and hurling the terrible thunderbolt; sometimes the head alone; but always wearing the "crown of wild-olive" round his well-curled locks. Mr. Gardner bases some very important conclusions on these Elean portraits of Zeus. He seeks by their aid to discover what was the character of the head of Phidias's great statue of Olympian Zeus. It is impossible for us here to enter fully into the argument; but the evidence offered by coins of the same date as the statue, by coins intended specially to portray the *Olympian* Zeus, and by a coin meant to be an exact copy of the Phidian head of Zeus, would certainly seem to force upon us the conclusion which Mr. Gardner himself scarcely ventures to draw—that it is really possible to reconstruct the head of the Phidian statue from the materials supplied by the coins.

Though Zeus and his symbols occupy the greater part of the Elean coinage there are several other interesting types. It is very noteworthy that a head of Hera—one of the finest, by the way, in the whole range of Greek coins—appears on the coins of Elis at the very time that the same goddess appears on the coins of her favourite Argos, just at the epoch when the Eleans deserted their old Spartan alliance for a league with the Argives. If a daring hypothesis of Mr. Gardner's is to be seriously accepted, a very high interest attaches to one of the coins of the old eagle and thunderbolt type, issued after the return to the Spartan alliance. It bears on the obverse the letters ΔA, and Mr. Gardner interprets these as the initials of Daedalus, who, according to the best authority, that of Pausanias, executed a trophy which the Eleans at this period erected at Olympia to commemorate a victory which they won over Agis in the course of the war which ended in a revival of the Lacedæmonian alliance. Mr. Gardner pleads eloquently for his theory, and the coins of this period do undoubtedly bear the marks of a renewed energy and skill in the artists; but it would be hard to persuade any one but the discoverer of so delightful a coincidence that the argument for Daedalus's name on the coin possesses much strength beyond that of the eternal fitness of things. Other types worth remarking are those of the nymph Olympia, and of a warrior leading a horse and carrying a spear, supposed to be Pelops, whom the Eleans probably adopted from their predecessors, the Pisatae, and whose chariot-race with Oenomaus appears on the pediment of the temple of Zeus. The whole coinage of Elis is full of curious parallels, and Mr. Gardner has done justice to his subject. It is much to be hoped that the succeeding chapters of the "New Eckhel" may not fall short of the first in general archæological interest; but it was not the good fortune of every Greek city to exercise the high presidency of the Olympian games, and to stamp its coinage with the majestic features which Phidias conferred on his Olympian Zeus.

A GOLDEN SORROW.*

THE heroine of this story, Miriam Clint, not only suffers a golden sorrow, but also has "the true, rare, wonderful golden eyes." Very early in the book, before indeed she had left school, she muttered to herself, as she was sticking additional pins here and there amidst the masses of her rich plaits of hair, "I mean to be a rich woman, and to have my own way." She carries out her intention, marries for money, becomes unhappy, and so suffers a sorrow that is as golden as her eyes. She later on commits a great crime, and no doubt ought to have passed the rest of her days in sackcloth and ashes, if not in penal servitude. She does no such thing. She is at length delivered from her first husband, and by her penitence gains a second, and yet does not lose her ill-gotten riches. In the end, therefore, her happiness may with great propriety be described as being as golden as her eyes and her sorrow. Though Miriam, as we gather from the title of the book, is clearly meant to be the heroine, yet there is another young lady, Florence Reeve by name, who holds quite as high a place in the reader's estimation. She begins in poverty, and never aims at wealth. Nevertheless, by a most wonderful chance, she becomes nearly as rich as Miriam. In fact, the story has a highly moral conclusion. There are in it three very bad people. They are all cleared away in due course of time, while the heroine and the virtuous characters are left, as the curtain falls, in a state of great respectability and even affluence. Miriam, to be sure, had committed forgery; but what of that? She had repented, and a penitent heroine—above all, a penitent heroine with the true, rare, wonderful golden eyes—surely deserves in a second marriage with a young husband to find some recom-

* *A Golden Sorrow.* By Mrs. Cashel Hoey. London: Sampson Low & Co. 1880.

pense for all she had suffered from the gloomy and elderly tyrant whom she had first married. Her lot as a girl had been a hard one. Her father was even a greater brute than her first husband, and that is saying a great deal. He had but two children—Walter, who is one of the two heroes, and Miriam—and he treated them with the greatest harshness. He lived in "a gloomy house in a dull plateau of unkempt grass." He did not mix with the country gentlemen his neighbours, but spent his time in drinking and swearing. When the necessities of the plot required it, he brought his swearing to an end by drinking himself to death. His son he had driven from home, and the young man, on a small allowance, was studying medicine in London. There he had met the second heroine, Florence, the orphan daughter of a clergyman, and had secretly married her. His allowance was not enough to support both of them, and, moved thereto by his friend Lawrence Daly, the second hero, he resolved to start with him for the newly discovered gold-fields of California, in the hopes of quickly making there his fortune. He persuades his sister, who was just leaving school, to take his wife home with her as her maid. This she does, and Florence, who passes under the name of Rose Dixon, is not once suspected by her father-in-law to be anything but a servant. Before long an elderly widower of great wealth, Mr. St. Quentin by name, visits in the neighbourhood. He falls in love with Miriam as much as it is possible for a man to fall in love who had already broken the heart of one wife. She at once accepts him, carrying out her schoolgirl resolve to be a rich woman. She receives from him a wedding-present of very fine and tastefully selected jewels, and for a time has a pleasant enough life of it. It is almost impossible to imagine that any one could be unhappy in such a scene as the following:—

Miriam was in her boudoir—a large room, with a richly-furnished conservatory at one end, where there was a crystal fountain with an alabaster basin, wherein gold and silver fish disported themselves, and an aviary tenanted by bright-winged birds; where there was a background of strange tropical growths and feathery frondage, from which banks of gorgeous blossoms, and velvet leaves, with cunningly disposed lights, dispersed among them, sloped downward, and surrounded the fountain in semicircular form, with an interval of marble mosaic. The air was warm and perfumed; the feathery rain of the fountain mingled its sound with the cooing voices of the doves nestling behind the silver wires of their cage; beyond the silken curtains lay the boudoir, in which every modern luxury was accumulated for the pleasure of its owner. Things at once beautiful and precious met the eye on every side, and on all was set the impress of supreme good taste in harmony of colour, of design, of arrangement.

But even boudoirs such as this, the youthful reader must take well to heart, do not secure the possessor from golden sorrow. We grieve to have to state that, in utter disregard of the impress of supreme good taste, even in this elegant boudoir, the old man would suddenly lift the mask of smooth amiability, and show his teeth in a snarl, while his wife's great golden eyes flashed scornful triumph upon him. But matters grow even worse than this, though this was bad enough. He began to indulge in soliloquies, and laughed to himself a low, evil laugh, while his well-preserved, good-looking old face was a sight to see for vindictiveness and cunning. He gazed round on her boudoir, while he muttered to himself, "She likes all this; what taste she has! and, what a love of luxury and ease! She shall have it, plenty of it, as much as she likes, *for awhile*." He had resolved to make his will and leave all his property to a distant young cousin whom he had hitherto treated with the greatest harshness. This young man in the end turns out to be Lawrence Daly, the bosom friend of Miriam's brother Walter. Mr. St. Quentin, a short while before his second marriage, had changed his name, so that it is not till near the end of the story that the connexion between him and Lawrence is discovered. The elderly husband, bent on at once carrying through his purpose, hurried over to England to see his lawyer at a time when he was suffering under a severe attack of gout. With a degree of rashness that one would scarcely look for in such a man, he insisted on crossing from Calais to Dover on one of those days when a crowd of people, from "some unaccountable sort of pleasure, arising probably from a subtle amalgamation of idleness and spite," always hasten to the pier to see the steamer come in. He was carried up almost dead to the hotel; but at once telegraphed for his lawyer. Miriam at the same time telegraphed for her brother, who had lately returned from California. He arrived a short time before the lawyer; but just after Mr. St. Quentin's death. Miriam, in that entire ignorance of the English law of intestacy which may be expected and excused in the heroine of a novel, thought that the heir-at-law, the distant cousin, would inherit all her husband's fortune, which, by the way, seems to have consisted entirely of personalty. Not a moment was to be lost. She made her brother disguise himself as a sick man at the point of death, and when the lawyer came he had no suspicion but that it was Mr. St. Quentin who was making the will. The trick succeeded, and Miriam came into the inheritance of the vast property. Happily for her, before long she met Lawrence Daly, the injured heir-at-law, and fell in love with him. She was also, much at the same time, seized with penitence, and at once made full restitution. He of course fell in love with her, and they were happily married. Her golden sorrow had been of but short duration.

Meanwhile Florence, the other heroine, had also had her experience of wills and testators. Not long after Miriam's marriage drink had begun to do its work on her wicked father, and he fell dangerously ill. Mr. St. Quentin would not suffer his wife to go to nurse him, and so she sent her maid—her sister-in-law in disguise as she really was. On arriving at the gloomy house in the dull plateau of unkempt grass, Florence found old Mr. Clint very ill indeed. The somewhat minute description of the drunkard's person we could, by the way, well have spared. Happily he is reasonable enough to attach himself strongly to his new nurse, and yet does not go so far as to add to the complications of the plot by falling in love with her. He goes on drinking till he has only just strength enough left to make his will. He leaves all his property to his faithful nurse. He even turns penitent, and really makes what, considering how [illegible]d how steadily he had been drinking, may be regarded as [illegible] respectable end. A highly melodramatic scene takes place when the will is read, and the lady's-maid is discovered to be the wife of the disinherited son. Walter, at the time of his father's death, was still working in the gold-fields with his friend Daly. As if the story had not in this double will-making interest enough, a third plot is formed for the scenes in California. The two friends discover a huge nugget which would have made their fortune. They are warned, however, by a faithful friend that a plot has been formed to rob them. Just at that time Daly was struck down with fever, while Walter had only had strength enough to secrete the treasure in a cave, and to write down in his pocket-book a minute description of his hiding-place, when he too was attacked by the same illness. The very night that he was seized by the fever, an attempt was made to rob his hut. A faithful but humble friend of the two heroes was murdered, and their no less faithful dog was strangled. The murderer was the medical man who was attending both, and who unfortunately carried off Walter's pocket-book. When Walter recovered, his memory had so far failed that he had altogether forgotten everything that he had done the day before he was attacked. The nugget, therefore, seemed to be hopelessly lost. His memory, however, somewhat returns in the course of time, and, at the very end of the story, Daly, on a hint gained from him, and accompanied by his wife, revisits the gold-diggings, and searches for the cave. He finds that the roof had fallen in, burying in its fall the medical murderer who, guided by the description in the pocket-book, had gone to seek for the nugget. With his death and righteous punishment the reader is left in a state of placid contentment. The two elderly wretches and the young but utterly vulgar ruffian had been cleared away, the beautiful heroine of the golden eyes had repented, while she and the rest of the young people were to pass the rest of their days in what we may perhaps be allowed to describe as a golden state of genteel respectability. Should, however, any young lady among our readers be ready to follow Miriam in her course, and to venture on trying golden sorrow, we would venture to point out to her that, after all, patience may be the wiser course. Had Miriam refused to marry Mr. St. Quentin, she would in a few months have been freed from that tyrant, her father, by the help of the brandy-bottle. Had she not later on forged the will, seasickness would have delivered her from her husband, while the law would of itself have given her enough to support a life of great luxury. She chose twice to act very wickedly; but, on the other hand, we must allow that one result of her wickedness was certainly to provide her with a very charming hero for her second husband. With such a conclusion as this, perhaps it might have been the wiser course not to have begun to moralize. At all events we will do what is certainly the next best thing to be done—we will at once bring our moralizing to an end.

STUART'S NILE GLEANINGS.*

(Second Notice.)

ALTHOUGH, as we have pointed out in a previous article, Mr. Stuart signally disappoints those who seek accurate archæological facts at his hands, we need not on that account lay aside his book considered as a record of travel. Mr. Stuart has a vivid power of description, and, as a rule, uses it well. Sometimes, indeed, he allows his pen to run away with him, and his English is exchanged, so to speak, for Irish. Thus in one place he tells us that King Amunoph slew with his own hand seven Kings, "but he magnanimously spared one." The context explains his meaning, but it certainly needs explanation. To another passage of the kind even a careful reading of the context gives no light. "I may observe here," says Mr. Stuart speaking of the royal ovals at Deir el Bahari, "that after the death of a sovereign, the successors, when mentioning their heirs, did not give them any titles except that of prince." The meaning of this passage, and, in fact of the whole paragraph in which it occurs, we must confess wholly escapes us. How many successors had a king after his own death? To whose heirs did they give the title of prince? And what has the sentence to do with the biography of the great Queen Amen Noomt Hatasoo Makara, who made Deir el Bahari? The meanings of royal throne-names are extremely obscure, and have engaged and baffled the learning of far better hieroglyphic scholars than Mr. Stuart. In the same paragraph in which we are told of kings' successors and their heirs he translates "Makara" as "Just by the grace of God." This certainly is a very free rendering of three signs which almost certainly signify "Justice the living representative of the Sun." Mr. Stuart is equally unfortunate in the further translation of the Queen's personal name. Amen Noomt, or, as he gives it, not

* *Nile Gleanings.* By Villiers Stuart. London: John Murray. 1879.

altogether without authority, "Amun Knoumte," means, there can be little question, the female representative of Amen Noom, the god of Karnac; with regard to Hatasoo there has been much contention among the learned. Herr Brugsch gives it as Hashep. He formerly called it Hashops. Mr. Renouf has shown very good reasons for reading the second part of the name Asoo, rather than Sheps. The meaning attached to this word would be "the heart of the venerable ones," or "the heart of princes." Mr. Stuart, mistaking the hieroglyphics of the first syllable for those which form *ha-oo-ti*, a leader, translates Hatasoo by "Leader of Princes," and adds, "it is possible that this title, 'Leader of Princes,' may have reference to the fact that she was guardian of her brothers." This guess is a good example of the rhetorical figure vulgarly called putting the cart before the horse. Hatasoo was the name the great Queen bore in her early youth. It was when she became the successor of her brother, Thothmes II., and the guardian of Thothmes III., that she assumed her longer name, and practically discarded the older one. The discussion of this point, as raised by Mr. Stuart, is so far important that it influences our opinion of his theory that Amenhotep IV. and the heretic Kouen Aten were two different kings. If he errs in a small matter, he will err still more in a greater one, and though he supports his view with much reasoning and a considerable number of drawings, chiefly portraits, we find it impossible, without better authority, to entertain it seriously. The idea is not new. Mr. Stuart's side in the controversy has long been looked upon as a losing one, and this is not the place or the time to reopen the question. As a considerable part of the book is taken up with it, we could not pass it by in silence; but, as we have already said, we greatly prefer Mr. Stuart in his narrative passages to Mr. Stuart when he writes upon theories and speculations which many more competent antiquaries have examined in vain.

One of the most interesting chapters is devoted to an account of the mummy pits at Gebel Aboufaida. Few travellers visit them. They are almost filled with the bodies of embalmed crocodiles. It was here that the late Mr. Harris found some fragments of Homer on papyrus, and the caverns have never been thoroughly explored. The difficulties of the descent into them are considerable, and Mr. Stuart's experience will not tempt many visitors to make the attempt. The rocks about the entrance are blackened by fire, and the story goes that a party of travellers had entered, and that soon after vast volumes of smoke were seen to issue. "Some sailors who had accompanied the party, and who were awaiting their return outside, tried to penetrate, but found the smoke so suffocating that they had to abandon the attempt. Neither the unfortunate explorers nor their guides were ever seen again." The fire burnt itself out at length, and nothing but charred bones of men and crocodiles were found when the cave was revisited. It was supposed that the spark of a cigar ignited the bituminous remains of some mummy wrappings. When Mr. Stuart entered, accompanied by naked guides carrying candles, he found the heat overpowering, and was much incommoded by the smell of ammonia. "Sometimes," he says, "the passage was so low and narrow that it was with difficulty we crawled through, one at a time; our lights were repeatedly extinguished by the bats which flew in our faces." Once or twice the cavern was large enough to admit of standing upright, and "at last we emerged into a chamber about fifteen feet across, and high enough to stand up in; in the centre it was supported by a single thick, glittering white stalactite." All about lay the mummies of men and of crocodiles. The light of some magnesium wire disclosed a scene worthy of Dante:—

> The naked bronze figures of my guides with their daggers, the strange weird forms of the reptiles, with their long snouts displaying rows of sharp white fangs, the grinning human heads (many with all their hair still on), thick curly hair, and white gleaming teeth and hollow eyes, that seemed to reproach us for disturbing their rest, the litter of grave-clothes, the shrill complaining cry of the bats as they flew hither and thither, and then the dark shadows of the recesses that opened on all sides, and had served to store the mummies in—all this formed an experience never to be forgotten, and scarcely to be surpassed by the wildest nightmare.

The largest crocodiles taken out measured about fifteen feet, but there are little ones also. Mr. Stuart dived into one of the lateral passages, but soon felt he had seen enough, and that to stay much longer would be to incur the danger of joining the ghostly company. Never, he says, can he forget the delicious sensation of the first taste of fresh air about fifty yards from the entrance, though at starting he had thought it so villanous. When he inquired how it came to pass that the mummies had all been disturbed and scattered about, the Arabs of course laid the blame first on the Khedive; "but the greatest destruction had been caused by a German speculator, who, about three years ago, came and employed men to bring out the mummies wholesale," and, stripping the rags for a paper mill, turned the bones of men and crocodiles alike into superphosphate. Mr. Stuart offered a dollar for a good specimen of a mummied crocodile. The Arabs "disappeared into the bowels of the earth, and, after the lapse of half an hour, we heard them below, and then there slowly arose through the fissure the grisly apparition of a human mummy stripped of its bandages, and, therefore, naked, but quite perfect, mounting bolt upright from the depths beneath, as if through the trap-door of a theatre without any visible motive power."

An interesting chapter also records the success of Mr. Stuart's wish to witness the opening of an untouched tomb—a wish shared, but usually in vain, by most Egyptian travellers. It was at Dashoor, a part of the necropolis of Memphis seldom visited by any but enthusiastic archæologists. "We were early one morning summoned," says Mr. Stuart, "with much mystery, and conducted on foot (they feared to trust the donkey boys) several miles across a tract of desert." At the bottom of a pit was a doorway admitting to a small chamber excavated in the limestone. "On the floor with their heads towards the east, lay two mummies." Not a fold had been disturbed. They had not the usual doll-like look of mummies, but "the aspect of bodies in their shrouds, nothing more." One was large and tall, the other smaller; perhaps they were man and wife. They "appeared sound and solid as they lay there, but when one of the Arabs put his hands beneath the shoulders of the larger one, and tried to raise it up, it collapsed to fragments." It was "as if it had been a phantom." Mr. Stuart accounts for its fragile condition by its great antiquity; at the latest the tomb probably belonged to the time of the Sixth Dynasty; but we are not told of any hieroglyphics, and the author omits to say whether the tomb contained any scarabs or beads, or anything else by which the date could be ascertained. It does him honour that he refrained from further disturbance.

With regard to recent political events in Egypt, Mr. Stuart endeavours, like many other travellers who had received favours from Khedive Ismail, both to run with the hare and hunt with the hounds. He gives some additional details of the shocking famine of last year, which probably precipitated Ismail's downfall, and in a chapter on the sugar factories makes very indignant reference to the forced labour by which they were carried on. "While here I saw a long train of boys and girls carrying immense jars of molasses on their shoulders, and there walked beside them men in fezzes, armed with whips, and they used them on the backs of these poor creatures whenever they did not go fast enough for them, and whenever they strayed out of line." He adds this appeal in italic type:—"Consider, O Englishmen, who hold Daira bonds, that this is the machinery through which your 7 per cent. dividends are wrung from the people." He adds many harrowing details from personal observation and a few of the stories which were afloat. "The prevalent corruption is so great that the Khedive himself is robbed in all directions." Against such passages as these we may put what he calls "a good word for the Khedive," the text for which appears evidently in the sentence, "One thing I am sure of, that travellers in Egypt will miss the courteous treatment which they invariably experienced at his hands"; but, he adds, "As for any reform in the general condition of the peasantry, no real improvement is possible so long as the present corrupt race of Turkish officials remain in power." The Khedive's civility to English travellers was part of his policy. He cared little for his people. He cared much for the possibility of drawing—as he supposed indefinitely—on English funds. He made the cardinal mistake of fancying that the money and his credit were inexhaustible. It is, however, but right that English gentlemen who, like Mr. Stuart, accepted his hospitality, even if they did not buy his bonds, should try to "say a good word for him" now that he is fallen from his high estate. Those who would not condescend to shake hands with him—and they were many—can now afford to make the best of him, and at least to regret that, being a Turk, he was unable (perhaps from constitution, perhaps from education) to remember that the whole art of government does not consist in killing the goose that lays the golden egg.

We bid farewell to one of the most ambitious books that have appeared about Egypt, ancient and modern, with the hope that the author may be able to see his way to having his "Gleanings" thoroughly sifted, in order to make them what, in many respects, they deserve to be considered—a gathering of valuable and trustworthy information. We have noticed many things that are wrong, many indications of ignorance; but it is only due to Mr. Stuart to say that his researches have been carried on in a praiseworthy spirit of independence which we should be sorry not to appreciate. His book, as we said in our former notice, is disappointing; but we trust we have shown that it has good points, and is worthy of an effort to make it what at first sight it seems to be.

WARD'S CHAUCER.*

THAT Mr. Morley's "Men of Letters" series—a collection of essays intended to popularize the lives and works of our best literary artists among those who do not aspire to a professional or scholarly knowledge of English literature—should, as a matter of course, include a sketch of Chaucer, is one among many proofs of the striking growth of Chaucer's general influence which has been characteristic of the last fifteen years. Since the days of Lydgate and James I. of Scotland he has remained through all phases of our literary history a poets' poet. All who have felt it necessary to their own poetical development to come at the best of English poetical thought and expression in the times preceding them have read and loved him. Our own generation has seen the rise of what we may almost call a third Chaucerian school, headed by Mr. Morris, producing verse which, however necessarily deficient in Chaucer's *naïveté*, aims above all things at his story-telling effects and strong purity

* *English Men of Letters.—Chaucer.* By Adolphus William Ward. London: Macmillan & Co.

of colour. But it has also seen much more than this. Thanks to an antiquarian revival which has almost assumed the proportions throughout Europe of another Renaissance, working upon the early literary material of modern Europe as the Renaissance of the fifteenth and sixteenth centuries worked upon the literary material of Greek and Roman antiquity, Chaucer's influence among us has now been guaranteed by causes more permanent than any poetical fashion. On the one side, we have become accustomed to see bestowed upon the elucidation of his work and personality an amount of scrupulous labour which former generations reserved exclusively for classical authors; on the other, we have seen portions of his writings, and the language in which he wrote, introduced into the ordinary school training of large numbers of English boys and girls. Chaucer is now in a fair way to be more widely read and truly enjoyed than at any previous time in history, not excluding his own age. And, in spite of the unpopular and technical character of much of their work, of the counting and theorizing and hair-splitting in which Mr. Furnivall delights, it is to the scholars that this result is mainly due. The industry and ingenuity of Mr. Furnivall, Professor Skeat, Mr. Bradshaw, and Dr. Morris has had two results. It has attracted to the work and to the subject a great number of persons to whom any intricate literary problem seriously attacked is in itself inviting; and it has in the long run so prepared the ground, so cleared and shaped the older tangle of fact and legend, that the general imagination now finds in Chaucer a subject of old-world charm made real and living with to-day's life by the mere force of searching and strenuous discussion.

Professor Ward's book is perhaps the first substantive attempt to give popular shape to all the results that modern Chaucerian scholarship has now achieved. Mr. Lowell, in his brilliant but most unequal essay in *My Study Windows*, based his account of Chaucer's development and characteristics upon a thorough study of the material then accepted, as well as of the points then in debate; but his treatment was necessarily sketchy and imperfect, and many questions of interest have materially advanced since he wrote. M. Sandras's *Étude* and Professor Ten Brink's *Studien* were both of them eminently readable books, written from a literary standpoint to which the mass of Chaucerian criticism makes no pretension. But both were books of discussion, addressed to the few rather than to the many. Professor Ward's book, on the contrary, as was to be expected from the series in which it appears, is a book of statement only. With the exception of a few points where the bulk of the controversy admits of a sketch of its main features, and where the debate raised is not of too technical a nature to allow of its reproduction in such a book as the present—as, for instance, in the case of Chaucer's marriage or of his relation to the Wycliffite movement—Professor Ward contents himself with summarizing in a popular form the main results of the best English and foreign criticism of the poet's life and works. He dissents from these main results in one point only, the question of the authenticity of the "Romaunt of the Rose." On others he sometimes shows a disposition to distrust some of the more ingenious German conjectures, as in the case of those affecting the Parson's Tale, or the various editions of the theme of the Knight's Tale; while we miss from his pages some of the most attractive results of Professor Ten Brink's comparison of Chaucer with his Italian masters. Still, on the whole, the book represents the general condition of Chaucerian study, and the main positions arrived at, in a singularly fair and accurate way, and in so doing supplies a want which has long been felt.

Professor Ward divides his essay into three chapters—"Chaucer's Times," "Chaucer's Life and Works," and "Characteristics of Chaucer." Of these the first is perhaps the least and the third the most successful. It requires very special gifts of style and treatment to sketch a crowded epoch in forty-six small pages, so as to bring home its main lines and features to the reader without either confusion or exaggeration. Dean Church possesses these gifts in a high degree, and they were shown in the "Gibbon" of the present series by Mr. Cotter Morrison. But they do not necessarily accompany learning and understanding, and certainly the latter half of Professor Ward's book strikes us as much more evenly successful than the first half. In the chapter on "Chaucer's Life and Works," the main periods of the poet's literary career are brought into connexion with the leading facts of his biography, while the works are grouped under the periods in a scheme corresponding generally to the scheme put forward by Mr. Furnivall in the "Trial Fore-words," although Professor Ward as a rule refrains from adopting the dogmatic tone of the specialists, and appears to regard a greater number of points as open questions than they would perhaps admit to be such. This adds to the fairness and independence of the book, but it leads every now and then to a more tender treatment of old mistakes than is desirable. The "Romaunt of the Rose" may be still a debateable question, though the traces of Northern dialect in the rhymes, recently pointed out, are a hard problem for the champions of its authenticity; but there should be no "ifs" allowed in such matters as the Chaucerian authorship of "The Flower and the Leaf" or of "Chaucer's Dreme." Professor Ward's account of Chaucer's debts to France and Italy is very freshly and clearly written, and brings out, what is becoming every day more apparent, that while the influence of France upon Chaucer has been allowed rather more than its due place in his literary history, that of Italy has been till quite lately very much underrated. We cannot help wishing that room had been found for a reproduction of Professor Ten Brink's suggestions of the relations of the *Troilus* and of the *House of Fame* to the *Divina Commedia*. They are probably quite unknown to the majority of English readers, and even if they are not to be taken as made out in all points, they are so full of promise of fresh light upon one of the most attractive of literary problems, the inner relations of one great poet to another, that they deserved reproduction. When Professor Ten Brink points out that the *Troilus* is divided into five books, combining in unequal proportions the ten books of the *Filostrato*; that this division into five books answers to the rules laid down with special plainness by Dante for the conduct and subject of comedy and tragedy; when he draws attention to the prologues introducing each book of the *Troilus* as not existing in Chaucer's immediate model the *Filostrato*, but as imitated from those of the *Divina Commedia*, and points out the close connexion between the prologue to the second book, that is the middle stage of the comedy, and the prologue to the *Purgatorio*, the middle stage of Dante's great *Commedia*; and when, in addition to these structural connexions, he is able to produce passages in which Chaucer, discarding the image furnished him by the *Filostrato*, makes use of one taken direct from Dante, the reader feels himself brought into a singularly close and delightful contact with Chaucer's mind and method. Each suggestion advanced is not equally strong, but the whole series is most convincing, and seems to admit us to some of the more intimate secrets of the poet's workshop. The resemblances between the *House of Fame* and the *Divina Commedia* are not so striking, and have been often contested. Still there is foundation enough for the general view that the *House of Fame* is a sort of burlesque counterpart of the *Divina Commedia*, and further careful comparative study of the two works will probably yield fresh evidence of connexion. From the *Troilus* and the *House of Fame*, and even in a higher degree from the *Assembly of Foules*, overwhelming evidence is now forthcoming that Chaucer was a devoted student of Dante, and was related to him in more intimate and important ways than he was to Boccaccio, in spite of the large mass of poetical material which he owed to the latter.

Professor Ward is particularly good on the dramatic character, the "comedy," of the *Canterbury Tales* as a whole, on the life and force of the framework, especially of its main component, the personality of the Host. He dwells on the excellent dramatic opportunities afforded by a journey of any kind undertaken by a number of people, especially by such a journey as a mediæval pilgrimage:—

> One goes to pray, the other seeks profit, the third distraction, the fourth pleasure. To some the road is everything; to others, its terminus. All this variety lay in the mere choice of Chaucer's framework; there was accordingly something of genius in the thought itself; and even an inferior workmanship could hardly have left a description of a Canterbury pilgrimage unproductive of a wide variety of dramatic effects.

As to the *Tales* themselves, it is not quite easy to understand why only two should have been dealt with at any length, and those two the Pardoner's and the Parson's. Surely from the point of view of popular effect it would have been better to have curtailed the problem of the "Parson's Tale" in favour of a more adequate treatment of the "Knight's Tale" or the "Man of Lawe's Tale." And a good deal more quotation might have been allowed in this section with advantage.

The last chapter, on the Characteristics of Chaucer, is well arranged and well put. His modesty, his animal spirits, his learning, his relations to nature, his dramatic power, his simplicity, his magical wealth of expression—all these points are sketched and illustrated as fully as the limits of the book allow. The curious mixture in Chaucer of old and new worlds, of the Renaissance and the middle ages, does not escape notice, and Professor Ward dwells happily on Chaucer's *naïveté*, on that element of childishness and crudity in him, inseparable from his place in history, which has so often obscured his true rank as a poet. That rank is now universally conceded, and every year that passes will probably see Chaucer more widely read and more truly understood. The present volume, as a pleasant and accurate sketch of the results of modern work on Chaucer, makes a useful contribution towards this end. The perusal of it takes a reader back to a judgment partly quoted by Professor Ward, as true for us as for its original audience, the judgment of a finished and exquisite critic, who was himself, as far as his poetry was concerned, a genuine heir of Chaucer's freshness and force. "Chaucer," writes Sir Philip Sidney in the *Apology for Poetry*, "undoubtedly did excellently in his *Troilus and Cresseid*, of whom truly I know not whether to marvel more, either that he in that misty time could see so clearly, or that we in this clear age walk so stumblingly after him." Not that Chaucer in Sidney's eyes was without "great wants." Yet are these "fit to be forgiven in so reverend antiquity." Generations of Chaucerian students will scarcely arrive at a mood of criticism more true or more fruitful.

THE LAW OF MONEY SECURITIES.*

WE suppose it is owing to the difficulty of discovering new subjects for law books that treatises are written of the class of that recently issued by Mr. Cavanagh. It is impossible so to classify legal matters that each shall fall under only one head, and,

* *The Law of Money Securities.* By C. Cavanagh, B.A., LL.B., of the Middle Temple, Barrister-at-Law. London: Stevens & Sons. 1879.

when treated under that head, be considered as finally disposed of. As in natural science, legal doctrines may be divided into genera and species; but, otherwise than in natural science, legal specimens, so to speak, not unfrequently pertain to one or more departments or sections of legal knowledge. Thus Mr. Cavanagh is perfectly within his province when dealing at length in his present work with Bills of Lading; but the same subject will be found at just as great length and just as fitly in any work on the law of Merchant Shipping. It is unfortunate that this interlacing of subjects is unavoidable, inasmuch as it involves in almost every law book the introduction of a quantity of old matter; and in the case of a book like Mr. Cavanagh's, which covers a very large field, the effect produced is almost that of what used to be termed in music a "pasticcio," or work composed of excerpts from others. Mr. Cavanagh says in his preface that "there exists no one complete book on securities of a monetary nature to which reference can be made either by lawyers, or by bankers, brokers, money-lenders, capitalists, or other classes in the commercial world," and he puts this forward as a justification for his book; but the subject has been so largely cut into by such standard works as Byles on Bills, Fisher on Mortgages, and others we could mention, that we may be pardoned for questioning whether it would be altogether worth while to write a book which should be merely a compilation of the information derivable from the works of previous authors. Mr. Cavanagh has, however, done more than this, inasmuch as he has, to say the least of it, amplified the treatment which some of his subjects have met with at the hands of prior text-writers.

The term which Mr. Cavanagh has selected as a title for his work he explains as designed to include all securities for the payment of money, whether founded on the personal credit of the individual or body giving them or on the rights they convey over specific property, and at the same time to exclude mere documents of title, which, though capable of being utilized as securities by means of deposit or pledge, are not of themselves rightly termed securities. The subject, even thus curtailed, is, as we have remarked, a very wide one; but after a careful perusal of the book, we are not disposed to quarrel with its author, when he describes it in his preface as an "exhaustive treatise."

The first fifty pages are occupied with the law of the most ordinary and simple forms of money securities—namely, I. O. U.'s, promissory notes, bills of exchange, and bank notes; and a chapter follows on Post Office Money Orders, in which the important question is broached, whether such documents constitute bills of exchange within either the Common Law meaning of the term or the provisions of the Stamp Act. Mr. Cavanagh inclines to the belief that, viewed in the latter light, Post Office Orders are practically bills of exchange, with the result that they cannot be sued upon without being duly stamped, which, as a matter of fact, they never are. In Mr. Cavanagh's next chapter on Bonds and Post Obits, he lays down a principle to which we are bound to take exception. In speaking of the usual method of ensuring the performance or fulfilment of a condition by a bond with a specified penalty attached to the breach of such condition, he lays it down as law that, "if the obligor be sued on the bond, not the amount of the penalty, but either damages for the actual injury sustained or the sum secured (if such there be), interest and costs can only be recovered against him." This is not strictly true. Courts are no doubt anxious nowadays to discover grounds for not mulcting a man in an amount altogether disproportionate to the injury he may have occasioned; but in cases where the object of the agreement between the parties is obviously to assess the damages beforehand in case of any future breach of contract, no court will intervene to release either party from his engagement, or to mitigate the consequences of such breach when committed.

Under the heading "Foreign Securities" Mr. Cavanagh correctly describes the rights, or rather the practical absence of any rights, acquired by the British subject who advances money to a foreign Government upon its securities; but the law, as laid down by a series of decisions, is perhaps unknown to the majority of those confiding persons who become foreign bondholders. The issuers of foreign loans are usually bankers or financial agents in this country of more or less reputation or credit according to the class of business they undertake; but as they act avowedly only as the agents of the foreign Government, there is no personal remedy against them. Then, as the sovereign power of a nation or independent political society can owe no legal obligation, it follows that the claim against the foreign State is a purely moral one—a not very valuable security for money in cases which could be mentioned, especially as no English Court has jurisdiction to enforce the contracts of a foreign Government against the property of such Government in England, or to lay hands upon funds in the possession of the agents of such Government, even though such funds have been specifically designed for the payment of its obligations.

After treating of the legal incidents of life policies of insurance, which, besides being primarily securities as against the Insurance Companies, are very frequently utilized as collateral securities in cases where money is borrowed, Mr. Cavanagh passes to the consideration of the less known class of securities classed as judgment securities, whereby the person giving the security puts it within the power of the other party to enter judgment against him for a specified amount without the previous formalities of an action. A judgment being, in the eye of the law, the highest conceivable obligation between man and man, and being enforceable by immediate execution, it is obvious that this class of security affords a paramount protection to its holder, enabling him in default to seize the whole of the debtor's property, real and personal, in satisfaction of his debt. The only case in which this class of security would be inefficacious is of course that of a borrower whose property amounts to little or nothing, who has usually to resort to some other form of security, such as pledge, if he wishes to raise money. The three modes by which a judgment can be obtained by way of security are:—(1) By a warrant of attorney; (2) by a "cognovit actionem," a form of legal process somewhat out of date now, we fancy, but which is familiar in connexion with Mrs. Bardell and Messrs. Dodson and Fogg's costs in the action of Bardell *v.* Pickwick; and, (3), a judge's order; each of which Mr. Cavanagh describes at some length.

The next two sections of Mr. Cavanagh's book deal with guarantees and mortgages of land or ships, with regard to which subjects we defy any author to say anything new. The most, therefore, that we can predicate of this part of the work is that it appears complete and correct. We were rather puzzled, however, after plodding through Chapter xx., headed "Mortgages of Ships," and relating to that subject, to find Chapter xxii. beginning with these words:—"Mortgages of Movable or of Personalty, comprising—1. Mortgages of Goods and Chattels other than Registered Ships; 2. Mortgages of Registered Ships and Shares therein"; and apparently proposing to deal with each of these and two other classes of mortgages of personalty in the subsequent portion of the work—a promise which reference to the index will show not to be performed in the case of mortgages of ships, as indeed there is no need it should be, the matter being already disposed of. This curious discrepancy must be the result of some mistake of arrangement, and will no doubt be rectified should Mr. Cavanagh's book reach a second edition. The chapter above referred to on "Mortgages of Goods and Chattels other than Registered Ships" is interesting, and here, almost for the first time in his book, Mr. Cavanagh is able to exercise his ingenuity on some absolutely new matter, afforded by the Bills of Sale Act, 1878. In relation to this enactment the author raises the disquieting question whether, on a strict and literal interpretation of the words of the statute, ordinary receipted invoices for goods purchased are not "bills of sale" requiring registration to ensure their efficacy. Mr. Cavanagh arrives at the right, which is also the reasonable, conclusion on this point, but we regret to notice that he bases an argument on the punctuation of a section, apparently forgetting that original statutes are not punctuated at all. Save, however, for the above item, this chapter contains little or nothing that has not appeared before, and the long disquisitions on fixtures and assignments void as against creditors read almost like extracts from Smith's Leading Cases and Robson on Bankruptcy. In dealing with the difficult subject of equitable assignments, Mr. Cavanagh writes clearly and well, and this portion of his book may compare not unfavourably with the treatment of the same matter by Mr. Leake in his work on Contracts; but we refer in vain to the present work for a solution of the question which must sooner or later arise, as to whether the new rule introduced by the Judicature Acts on this point is to be looked upon as retrospective or not—that is, whether assignments made before the Judicature Act, and not in accordance with its provisions, can be sued upon. Another curious question might be raised on the new Innkeeper's Act of 1878 quoted by Mr. Cavanagh in p. 354. This Act gives innkeepers, and the proprietors of hotels and licensed public-houses, the power, vulgarly supposed to belong to them of common right, to sell horses, carriages, or other goods left on their premises "to defray expenses," as the phrase is. But prior to such sale, the innkeeper or hotel-keeper is "to advertise in one London and one country paper, of which the latter circulates in the district where such goods or some of them have been deposited or left," and the obvious difficulty is, how is a London hotel-keeper to comply with this requirement. Mr. Cavanagh does not tell us, and if the Statute provides a solution of the matter, he does not mention it.

"Collateral Securities" absorb nearly fifty pages of Mr. Cavanagh's book, and the author plunges boldly into the mysteries of "marshalling, and the appalling intricacies of what is technically known as "the rule of ex parte Waring," with regard to which he honestly acknowledges his indebtedness to the treatise of Mr. A. C. Eddis, one of the very few persons who can claim to have threaded this legal labyrinth, into which we do not propose here to follow either him or Mr. Cavanagh. After a chapter on "Actions and other remedies on Securities," in which the author somewhat unnecessarily details certain provisions of the Judicature Acts which ought by this time to be matter of common knowledge, Mr. Cavanagh concludes his work with a long and interesting account of the manners and customs of the Money Market and Stock Exchange, as being the places where "securities," in the ordinary acceptation of the term, are most largely dealt in. Here we find elucidated cabalistic terms, such as "contango," "backwardation," "put and call," and so forth; while the operations by which the sale and purchase of stocks and shares, and other Stock Exchange transactions are carried out are so clearly explained that the merest outsider would, after a perusal of this part of Mr. Cavanagh's book, be able to study the money articles in the newspapers with a reasonable degree of intelligence. Lord Justice James has declared that Capel Court is not an Alsatia within whose precincts Her Majesty's writ does not run, and ordinary legal principles have thus been applied to matters hitherto deemed to be within the exclusive jurisdiction of the Committee of the Stock Exchange. The batch of cases by which this innovation has

been developed are clearly summarized by Mr. Cavanagh, as also several instances in which the validity of time bargains has been before the courts.

Looking through what we have written, we are afraid we have been rather hard on Mr. Cavanagh, and not given him due credit for the really careful way in which he has done his work from beginning to end. Irritation at having to wade through so much old matter is possibly at the root of our lack of enthusiasm, and no doubt were we to attempt to fulfil the task which Mr. Cavanagh has set himself, we should find it equally difficult to avoid reopening well nigh worked-out veins of law without incurring the risk of rendering the book incomplete. Moreover it must be remembered that text-books are primarily designed for students, who, when they are reading up a subject, want to know all about it; and, for the use of any one with a limited stock of legal knowledge and an equally limited law library, Mr. Cavanagh's book is an admirable synopsis of the whole law and practice with regard to securities of every sort. Far, therefore, from wishing to depreciate the present book, we desire to accord it all praise for its completeness and general accuracy; we can honestly say there is not a slovenly sentence from beginning to end of it, or a single case omitted which has any material bearing on the subject. These characteristics render it valuable to those who have no need to read it through, and who only require a book to which they may turn for a concise statement of the law on any given point within its scope and for reference to the latest cases.

LORD MASKELYNE'S DAUGHTER.*

MISS KETTLE is one of those careful and conscientious writers who steadily advance with experience and practice. She had always a pleasant style, and showed a strong sympathy with the beauties of nature; while there was an increasing interest in her successive stories. But her plots occasionally tended to the melodramatic, and her characters sometimes bordered on the fantastic. In *Lord Maskelyne's Daughter* we still distinguish some touch of the melodrama; but the story moves smoothly and consistently forward from the first chapter to the last. The least probable of its personages is his lordship himself, who plays, after all, but a secondary part. He is depicted with the haughty feelings of the aristocratic caste; he has been bred in habits of self-indulgence from his boyhood, and has hardened with a life of somewhat reckless dissipation. His dominating failing is his inveterate selfishness; and he has many follies to regret, and some more serious sins to repent. We can easily conceive such a man as he is represented being sensible to the gentler and more innocent affections, and abandoning himself in his softer moods to passing impulses of generosity. But we should have by no means expected to see him pressing his friendship and the hand of his daughter on a youthful farmer born in the peasant class, and accepting a succession of rebuffs from that independent spirit with a courtesy and complacency that never belie themselves. Yet there is this to be said for Miss Kettle's conception of Lord Maskelyne, that he is depicted as being eccentric as well as impulsive; and eccentricity may account even for apparent extravagances in a man who has given the reins to each newborn fancy. In other respects the story is as natural as it is simple, and not a few of the scenes are singularly pathetic. It is a tale of true love fostering itself in solitude, and hoping against hope; discouraged by the self-distrust which is almost inseparable from it, and struggling with the obstacles it ultimately overcomes. "A Story of the Northern Border" Miss Kettle calls it; and the promise of the attractive title is fulfilled by charmingly varied descriptions of scenery. There is something that has always been exceedingly fascinating to us in the wild country on either side of the border. Very often it is gloomy rather than grand; there is a certain monotony in the brown moors, in the grey stretches of waste, in the green valleys winding up among the hills grazed over by the flocks of the solitary sheep-farmers. But nowhere, perhaps, can we more vividly realize the most striking effects of cloud and storm. It lights up marvellously in the fitful bursts of sunshine between showers, and changes its whole aspect into smiling attractiveness under the unclouded brilliancy of some glorious summer day. It is a land of waters; of brooks and becks tumbling down the rocky glens in cascades that are now arched over by matted undergrowth, now shrunken in the summer droughts to silver threads, and now rushing down in the thaws or autumn rains in foaming, moss-stained torrents. Miss Kettle, who seems to know these districts well, has caught the spirit and enchantment of their scenery. She presents us with a series of graphic pictures, where we have lonely farmsteadings, picturesque cottages, and quaint old halls in the foregrounds, with wanderers lost in the mists on the moors, and anglers following their peaceful pursuits along the silent banks of sequestered streams. And she has done justice likewise to the somewhat rugged inhabitants, possessing a combination of qualities that makes them improve upon acquaintance, though they may repel the stranger on a first introduction.

Her hero, young Harry Forbes, is an excellent specimen of the best of the local types, Scotch by extraction, and of a well-descended family. Though born and reared on the English side, he has much of that Scottish pride of race which impels a man to do credit to his "forbears." Harry Forbes began life as a farmer's boy, but he has a field or two and a cottage of his own; and circumstances, with his own habits of economy, add subsequently to his little possession. So far most of his class would have called his existence a success; but to him it seems disappointment and failure. There is little more than a bare living to be made out of his barren land, and he has aspirations and ambitions, and longs to rise in the world. In as far as the means were within his reach, he has by no means neglected his education. With sound practical capacity there is a strong tinge of the poetical in his nature, and he is ready to give a welcome to any romance that may throw a warmer glow over his prospects. His aunt, who was austere in her manners, although greatly attached to him, was the only being in the world for whom he cared; but that was not the kind of affection for which he was pining. At last even his aunt is taken from him, and he is left absolutely alone. He would probably have quitted his native North country to seek his fortune elsewhere, when he meets with the adventure which changes his destiny. He stumbles on it under circumstances that are appropriately impressive. He is crossing the moors near his cottage on an April evening, when one of the dense hill mists is settling down upon them. Even a man familiar with the lie of the landscape might well fail to find his way in the dark, and any belated stranger must be hopelessly lost. Henry hears a plaintive cry for assistance in a female voice, and the voice comes from the vicinity of the Elf's Stone. There was many a wild tradition about the place, and in a momentary sense of superstition he experiences an involuntary tremor. Second thoughts of course reassure him, and he makes his way to beings of flesh and blood who are eager enough to welcome any deliverer in the alarming straits to which they are reduced. He guides two beautiful girls home to his cottage, where he shyly avails himself of his opportunities of respectfully admiring their attractions. The one whose graver and more expressive charms awaken his earnest admiration from the first was, by a strange coincidence, a vision who had haunted his dreams; in fact, she was an old acquaintance who had done him a kindness which he has now a chance of repaying. He falls forthwith over head and ears in love, and he loves with the passionate determination of his character, though he fears that the distance between them is a gulf he can never bridge. For these fascinating young ladies are the *protégées* of Lord Maskelyne, one of them indeed being acknowledged as his natural daughter; and they have the refinement of girls of birth and high breeding, having enjoyed the advantages of education and good society. Marguerite, whom Forbes adores, is sketched with extreme grace and delicacy; she reminds us at every turn of Wordsworth's ideal:—

> A perfect woman, nobly planned,
> To warn, to comfort, and command.

But her cousin Blanche is decidedly the more original of the two. Blanche is feeble in health, and somewhat weak in intellect. She has been in the habit of leaning on her stronger cousin; accustomed to have her invalid fancies indulged, she has developed the selfishness which she may have inherited from her father. When she is once on an easy footing of intimacy with their saviour, young Forbes, a strange transformation is wrought in her, though it is only when his eyes have been opened by proposals made to him by Lord Maskelyne that he awakens to the real cause of the change. Then he remembers how she had learned to cling to him; how each trifling incident connected with their intercourse had seemed to impress itself indelibly on her mind. Blanche had unwittingly given him her heart, and in her simplicity had been unable to conceal her predilections. He would gladly do much for her, but he cannot do what she desires; and whether the self-denying Marguerite might wish him to make that sacrifice for her cousin or not, he feels bound to say as much to Lord Maskelyne. The story of how Blanche learns to forget him in absence, and how she is brought to bestow her impulsive affections on another, of the hopes and fears of her new lover, as her brain grows stronger and then loses strength again, is told with no little art and pathos. And there is a moving interlude, where this new lover of Blanche's unwittingly gains the affections of Jessie Forbes, a pretty Scottish girl, and a cousin of the hero. At least as romantic, though perhaps less natural, is another love affair which is brought to a happy conclusion. Jessie's father had been attached in his ardent youth to a very lovely sister of Lord Maskelyne. The course of the love had of course not run smooth, and the penniless sister of the embarrassed peer had been forced to marry for money and position. She had been wedded to an old man who gave her a coronet, but no happiness, and who had died, leaving her a well-jointured widow. Her young admirer had married likewise, and made a fortune, and brought up children, and lost most of them. Now that accident has thrown the lonely couple together again, the old feelings revive, and it seems to them that, though it is impossible to go back upon the past, it would be a pity not to make the best they can of the future. Forbes makes up his mind to speak; and the Countess, whose heart is all in favour of his suit, gives a frank assent to his straightforward arguments. As for his nephew Henry, his retiring but resolute constancy has the success it deserves. It appears, indeed, that what he had half suspected all along was the case; and that he had really won his Marguerite years before, when he was

* *Lord Maskelyne's Daughter: a Story of the Northern Border.* By Rosa Mackenzie Kettle, Author of the "Ranger's Lodge," &c. James Weir. 1880.

worrying himself very unnecessarily over her fancied engagement to another :—

> Our wooing was very short, but sweet—all the sweeter, I think, for its brevity. In fact our love-making had been done long ago at the stepping-stones over the brook under Haggisthorne Peak. The moment Marguerite left her sister's side, and set her dainty feet on the grass to come and meet me, I knew that I had won my bride!

So a story that had threatened to be sad ends sufficiently brightly. It is true that Blanche remains unmated, and the separation from her second lover is the more trying because she has fully realized her mental feebleness, and recognizes that it condemns her to renounce the happiness that seemed for some time to be within her reach. But even Blanche in her new unselfishness has her consolation in being the angel in the house of the father whom she has reformed, and who repays her tenderness with the most absolute devotion. Altogether Miss Kettle's story is an extremely pretty one, and it has the merit besides of being kept within reasonable bounds, and of being published in comfortable type in a single volume.

GERMAN LITERATURE.

THE counter-reformation with which the Church of Rome endeavoured to parry the progress of Protestantism is an historical episode of the highest interest, the impartial treatment of which is obviously very difficult. No closer approach to absolute impartiality is likely ever to be made than that effected by Professor Maurenbrecher (1), a sincere Protestant, but so remarkable gifted with the power of placing himself at his opponents' point of view that his pages might occasionally pass for those of some judicious and temperate Catholic writer of the good old school exterminated by Ultramontanism. While rejoicing in the Reformation, he still almost makes it his particular business to point out how much vitality remained in Catholicism, and how sincere and widespread was the desire for a genuine reformation in discipline and morals, although the need for a return to primitive simplicity of doctrine was not equally felt. What especially distinguishes Professor Maurenbrecher from other historians of the Reformation epoch is the stress he lays upon the reformation effected in Spain by Cardinal Ximenez, by whom the popular demand was actually carried out, and who fairly realized on a small scale the ideal which zealous Catholics, with no leanings to a purely Biblical religion, must have formed of the Church Universal. Discipline was enforced, abuses were corrected, theological learning revived in an extraordinary manner; nothing more, on Catholic principles, should have been necessary. The simultaneous revival of the Inquisition as a necessary consequence of Ximenez's reforms showed but too clearly that the world could not be managed on such principles, and that a return to the mediæval Catholicism would be equivalent to a return to mediæval barbarism. Nothwithstanding this, the existence at such a time of one national Church conspicuous for purity of morals and orthodoxy of belief was a powerful element in determining the ultimate course of events. Professor Maurenbrecher carefully compares this reaction towards Thomas Aquinas with the contemporary and better understood reaction towards the classical ideal known as Humanism, and with the German Reformers' reaction towards the New Testament. Everywhere he shows himself equally accurate and impartial, and his history bids fair to rank high among the numerous delineations of one of the most interesting periods of human history. The first volume terminates with the death of Pope Clement VII.

A new History of Germany, by L. Stacke (2), is an excellent specimen of its class, but this class is not a high one. The work belongs essentially to the category of popular histories, and is perhaps chiefly significant as a symptom of the condition of popular feeling which renders such histories popular. From this point of view it is very satisfactory; the German people can only be congratulated on the condition of public sentiment which renders it worth the while of popular publishers to produce a work for general circulation adorned with so many engravings and chromo-lithographs. The latter are chiefly selected from mediæval MSS. The execution is perfect, and artistically and historically they are for the most part of the highest interest. They serve to recommend a fairly written but rather commonplace text, presenting the most accredited results of historical investigation with no pretence to independent research.

The celebrated exhortation, "Tu felix Austria, nube," is illustrated by K. Rausch's careful study of the circumstances attendant upon the Archduke Maximilian's espousal of the Princess Mary of Burgundy (3), which, combined with his subsequent election as King of the Romans, chiefly contributed to raise the House of Hapsburg to its present position in Europe. Herr Rausch ascribes these successes principally to the persevering diplomacy of Maximilian's father, the Emperor Frederick III., who redeemed his impotence as Emperor of Germany by his tenacious persistence in laying the foundations of a new State. Herr Rausch attributes the disorganization of the German body politic at this period to the disobedience and wilfulness of the Princes of the Empire, and his monograph may not improbably have been composed with the view of insinuating that German interests have always been most efficiently represented by Austria.

Abstruse points of chronology form the groundwork of Dr. Krusch's treatise on the controversies of the fifth century respecting the proper time of keeping Easter (4). The second part contains an edition of the principal chronological tables, tracts, and epistles from Popes and others relating to the subject.

Dr. Lohmeyer (5) investigates the obscure history of Prussia Proper, which involves constant reference to the histories of Poland and Lithuania. Considering the difficulty and uncertainty of the subject, his narrative is remarkably perspicuous and attractive. It comes down to the year 1407, and will be continued until the erection of Prussia into a kingdom in the early part of the eighteenth century.

A so-called sketch of the history of Ireland, by Karl Kautsky (6) is only worth notice as a specimen of the rubbish accepted as gospel by the adversaries of England on the Continent and in America. Herr Kautsky recapitulates all the harsh proceedings of English administrators in Ireland from Strongbow to Castlereagh, utterly ignoring the circumstances which so frequently palliated or necessitated them. He deals largely in statistics of Irish poverty prior to 1852, without a hint of the improvement effected since the country has been relieved of the curse of over-population. After the imprudent language of Mr. Gladstone, Herr Kautsky can hardly be censured for attributing that statesman's legislation to fear rather than to a sense of justice.

Without going quite so far as the late Baron Stockmar, who pronounced the English Constitution the corner-stone of all political science, Herr Max Büdinger (7) is greatly impressed by it as a work of art produced by no conscious effort on the part of any single legislator, but slowly elaborated under the pressure of circumstances by successive generations, "building better than they knew." The interest and admiration thus awakened in him as a student of political science have prompted the composition of a sketch of the present state of the English Constitution, accompanied by a series of historical studies on its practical development. The most important of these fall under the section devoted to the examination of the development of the royal authority, in which the relations of the latter at various periods to the nobility, the Church, and the commons, are very fully discussed. The book shows a thorough acquaintance with English history, and the subject is treated in an easy and agreeable style.

In a concise biography of C. G. von Waechter (8), Herr Windscheid records the history of an eminent German jurist, whose public life was divided between Saxony and Würtemberg. After having long officiated as Professor at Leipsic, Waechter removed to Tübingen, was induced by the political events of 1848 to return to Leipsic, and enjoyed the highest influence and authority at both places. The legislation both of Saxony and Würtemberg is greatly indebted to him.

The resemblance between the political constitutions of the German Empire and the United States (9) is not slight or far-fetched, although somewhat disguised for the present by the apparent tendency of the former to a more centralized organization. This tendency may not prove persistent; and at all events the difficulties which have recently arisen in adjusting the claims of the various States represented in the Reichstag lend weight to Dr. Schlief's exhortation to his countrymen to acquaint themselves with the most scientifically constructed of Federal Constitutions. After an historical and general introduction, he successively analyses the American Constitution in its two great branches, its provision for the exercise of legislative and of executive functions. Other sections treat of the right of impeachment, of constitutional amendments, and of the judicial power. The latter important subject is perhaps hardly treated with sufficient fulness, and enough is not said of the weakest point in the United States Constitution—the extreme difficulty of maintaining the dignity and purity of a judiciary chosen by popular election, and of a Supreme Court whose members are notoriously liable to be appointed on political grounds. It speaks volumes for the "law-abiding" quality of the English race that the authority of this august tribunal should have been, on the whole, so little impaired; and it is certain that the institution could only work on the Continent among a Teutonic or Scandinavian people. As Dr. Schlief is writing for Germans, his recommendation of American models is in a measure justified, although the United States offer no counterpart to the distinguishing phenomenon of German federalism, the preponderance of a single confederate able to outweigh all the rest.

It may be questioned whether any special need existed for Professor Siebeck's "History of Psychology" (10), which traverses

ground which surely ought to be covered by the ordinary histories of philosophy. If the special department of psychology really requires a special historian, the post will no doubt be adequately filled by Professor Siebeck, who proposes to dedicate six volumes to his subject. The first is devoted to the exposition of the ideas of the soul entertained by the predecessors of Aristotle. Democritus, Heraclitus, and Aristotle are the most fully treated.

Professor Eucken's tract (11) on the employment of metaphors and similes in philosophy contains many suggestive instances of the danger of building too much upon apparent analogies.

An illustrated work on Spain (12), the letterpress by T. Simons and the plates by Professor Alexander Wagner, promises to be a worthy member of the series of similar publications which is contributing so much to popularize the picturesque and archæological features of the most interesting regions of the earth, and which is at present better represented in France and Germany than in England. The arrangement of the work is geographical, beginning with the north-eastern corner of the country, and the two parts before us comprise the province of Catalonia. The text is very fairly written; but the distinguishing feature of the book is the illustrations, which are not only numerous and well selected, but are executed with peculiar dash and vigour, and with the indescribable quality which proves the artist to have imbibed the spirit of the land he is undertaking to delineate.

Dr. Scherzer (13), who has visited so many distant countries in the interest of commerce and statistics, took advantage of the recent visit of the Archduke Rodolph to this country to make a thorough examination of the great centres of English industry. The information he has collected and published offers of course more novelty to his Continental readers than to Englishmen, yet even the latter may derive advantage from a collection of useful statistics, admirably arranged in a compendious form. Considering the extremely depressed condition of British industry at the time of Dr. Scherzer's visit, his view of its condition and prospects is unexpectedly favourable. He admits the superiority of the British workman to all others, and considers that it more than compensates for the advantage which the low rate of wages abroad apparently confers upon his foreign competitor.

Dr. Kraus's Dictionary of Christian Antiquities (14) is designed to occupy a place in Germany analogous to that filled by Martigny's dictionary in France and Smith and Cheetham's in England. It is intentionally less extensive than the latter, being more strictly confined to archæology proper, which subject, however, is so defined as to embrace the specifically Christian legislation and domestic manners of the Church of the first six centuries, no less than the details of liturgical service and ecclesiastical art. Numerous articles on subjects not specifically Christian are of necessity admitted; thus the first part has very good ones on Abraxas, the Gnostic divinity, and amulets, which were forbidden by the Church. The work, in which Dr. Kraus is assisted by several coadjutors of reputation, is so far very fairly executed, and seems unaffected by any decided Roman Catholic bias. Its general resemblance to Martigny's dictionary is increased by the reproduction of the wood engravings illustrative of the latter.

The German Theatre (15) has now been for about ten years freed from the direct control of the State, and the results of the change have apparently not been entirely satisfactory to the patrons of the legitimate drama. The question, as in England, is now mooted whether the State ought not to establish a model theatre for the refinement of the national taste and the encouragement of a national school of acting. The affirmative side of the question is ably and temperately argued by an anonymous Government official, who, however, hardly meets the objections that such an institution is likely to be chiefly patronized by those whose taste stands least in need of purification, and that the number of intellectual centres in Germany would render the undertaking a very extensive one.

Herr Ludwig Bamberger's pamphlet on the Jewish question in Germany (16) is a fair specimen of the replies called forth by the sudden outbreak of spite, rather than of bigotry, of which Herr Treitschke has condescended to make himself the exponent. It is not unnatural that the progressive impoverishment of Germany under a *régime* of militarism, protection, and excessive taxation should have evoked a feeling of resentment against the class of the community which is least affected by these evils, and which, in so far as its calling is the lending of money at interest, even seems to profit by the general distress. Herr Bamberger has no difficulty in exposing the inconsistency of Herr Treitschke's position; but the causes which have made that worthy Liberal a persecutor can only be removed by a radical alteration in the state of Europe.

The Jewish question is further illustrated in two works of fiction by Karl Emil Franzos (17), whose lively and gossiping volumes on Eastern Europe have already gained considerable notoriety. In "The Jews of Barnow" Herr Franzos from one point of view challenges comparison with Sacher Masoch, inasmuch as he undertakes to give a picture of Polish, or rather Ruthenian, life; and in another with Gottfried Keller, as all his tales are laid within or near an imaginary locality, supposed to be as typical of Podolia as Keller's Seldwyla is of Switzerland. Without attaining the power or humour of his models, his stories are nevertheless very good, based for the most part on stirring situations ably conceived and effectively developed, and all illustrative of the author's thesis, "Every country has the Jews it deserves"—that is, the faults with which the Jews are taxed are more properly imputable to those who scorn or persecute them. The imitation of Keller is very apparent in *Moschko von Parma*, described as "the history of a poor, forgotten man, who was born in a remote corner of the world, and, after many journeys and adventures, died in it solitary and wretched as he had lived." This definition is not, indeed, carried out to the letter, for the conclusion of the tale, though sad, is not utterly unrelieved by comfort. Moscho himself is carefully drawn, and his adventures introduce us to a great number of characters who present all the appearance of faithful copies from life. In fact, the writer's works produce something of the effect of a gallery of copies; he gives us portraits instead of personages, but the portraits are life-like and accurate.

The *Rundschau* (18) begins with one of Herr Rudolph Lindau's excellent stories of English life and manners, which might easily pass for the work of an English writer. The scene is laid in Japan, in the year 1860, and the life of an Anglo-Oriental colony is very cleverly depicted. A sketch of the life of Bishop Dupanloup, by a Liberal Catholic, adds nothing to our knowledge of the Bishop's career, but is of some interest as a party manifesto. A paper on Cyprus is a neat summary of the extant historical information respecting the island, and concludes with a full admission of its importance to any Power aiming at preponderance in the Mediterranean. Perhaps, however, the most interesting contribution to an interesting number is a notice of the work of the French Ægyptologist Revillout in deciphering papyri written in the demotic character. These documents, belonging for the most part to the Ptolemaic or the Roman period, are philologically important as representing a phase of Egyptian intermediate between the language of the hieroglyphic inscriptions and modern Coptic; while their contents, being usually legal agreements or other matters relating to private life, contribute more to the illustration of domestic manners than the official manifestoes of the monuments.

The principal article in the *Russische Revue* (19) is an essay by Professor Eichelmann on the declaration of armed neutrality put forth by the Northern Courts in 1780, designed to establish that it was in reality a statesmanlike conception of the Empress Catharine, and not a mere incident in the rivalry of her Ministers Potemkin and Panin.

THE QUEEN'S BIRTHDAY.

THE celebration of the QUEEN'S birthday takes place to-day, and will furnish the accustomed occasion for Ministerial banquets and official festivities. It will also furnish one more occasion for the silent but sincere sentiments of a loyalty that remains among all political changes unimpaired and unchallenged from the centre to the remotest border of the Empire. The QUEEN'S reign has now been a very long reign, and it has been as blameless as it has been long. As it has been a long reign and a reign full of interest and teeming with incidents, it has become possible to mark off the stages of recent English history by the epochs of the QUEEN'S tenure of the crown. We are now in 1880, and we may, if we choose, go back by decades to 1840, when the QUEEN was married. It is just forty years since she entered on a married life rich in happiness to her and most fortunate for her country. If we take the year 1840 as the date of the first great event in her life as sovereign, and look at the events of that year as indicative of what was then the state of England and of Europe, we are struck by the curious manner in which the past and the present are always connected. Although we are reading of what happened forty years ago, we seem to be reading in a slightly altered shape of what is going on to-day. The year signalized by the wedding of the QUEEN and the PRINCE, and by the birth of their eldest child, was also marked by the first attempt on the QUEEN'S life, when OXFORD anticipated those senseless attacks on harmless and even beloved sovereigns which have lately been shocking and alarming Europe. In 1840 Lord PALMERSTON, by the exercise of great pressure and by the manifestation of his overpowering will, got together a Convention in London "to consider the pacification of "the Levant." Europe was as much troubled then as it is now with the pacification of the Levant, and the Levant is as little pacified as ever. In Ireland O'CONNELL addressed a vast assembly at Tuam, and vowed that he would never rest until Ireland had a Parliament of her own; and suggested that, when this great event happened, a column with his own burly image on the top should replace the offensive statue of WILLIAM III. Mr. PARNELL is now just as near to, and just as far from, having his effigy placed on a triumphal pedestal in honour of the first maker of an Irish Parliament as O'CONNELL was then. In regard to the East, Parliament voted its thanks to the commanders and troops who had conducted to a satisfactory close the contest in Afghanistan; a new ruler was found for Afghanistan, who was to receive the support and obey the dictation of England; and there were then, as now, persons like Sir WILLIAM MACNAGHTEN who urgently advised Lord AUCKLAND to annex Herat, and insisted that a very vigorous policy was the only effectual means of combating Russian intrigue. Historical parallels are, of course, never complete. It so happens that in each of the decennial years 1840, 1850, 1860, 1870, and 1880, a Liberal Ministry was or is in power on the QUEEN'S birthday. But forty years ago there was a Liberal Ministry as weak as the present Ministry is strong. The Government of Lord MELBOURNE just escaped defeat on a vote of confidence, but found itself in a humiliating minority when Mr. HERRIES attacked its general financial policy. In those days, too, there was presented a monster petition from Birmingham urging that effectual measures should be taken against Socialism, and now Birmingham sends Mr. BRIGHT and Mr. CHAMBERLAIN to the Cabinet. It may be added that, in 1840, LOUIS PHILIPPE brought back from St. Helena the bones of NAPOLEON, and thus opened the door to the Second Empire, which thirty years later went down in the dust of Sedan, and forty years later is giving rise to the burning question whether a monument to the heir of the BONAPARTES cannot be excluded from Westminster Abbey.

In 1850 the Duke of CONNAUGHT was born; another attack was made on the QUEEN by PATE, who received a quaint kind of punishment, being held sane enough to be transported for seven years and mad enough not to be whipped; and the PRINCE marked out in a significant way the part he was determined to play in English affairs. He placed himself at the head of the movement for the holding of an Exhibition in 1851; and, on the other hand, he refused to be named Commander-in-Chief, on the ground that it was his duty to sink himself in the QUEEN. In this year the QUEEN'S birthday itself was marked by an event which at the time gave rise to much comment and some uneasiness. The French Ambassador, M. DROUYN DE LHUYS, chose to leave London suddenly on that day, and Lord PALMERSTON had to give very express assurances that this was not to be taken as a sign of an approaching rupture with France. Much the most important political event of the year was the death of Sir ROBERT PEEL. Not only was one of the wisest, calmest, and most unselfish of advisers lost to the QUEEN, but a different colouring was given to English parties. Mr. GLADSTONE had very shortly before the death of Sir ROBERT PEEL supported Mr. DISRAELI in a proposal to throw a large portion of the cost of maintaining the poor on the Consolidated Fund, and he had done this in spite of the strong remonstrances of Sir ROBERT PEEL himself, who had declared that such a proposal would spoil all financial confidence in England. On the other hand, the famous debate on the PACIFICO case and on Lord PALMERSTON'S foreign policy had only just been brought to a close, and Mr. GLADSTONE had joined Sir ROBERT PEEL in opposing a policy of what both considered needless interference. It is a curious instance of the manner in which history repeats itself that, in answer to Lord PALMERSTON'S memorable application to Englishmen of the old boast "Civis Romanus sum," Mr. GLADSTONE said that this was to claim, not equality, but ascendency, in Europe; and that to urge a claim for English ascendency was to throw Europe into confusion. Towards the end of the year appeared Lord JOHN RUSSELL'S frantic letter to the Bishop of DURHAM, and the wave of angry and timid passion which led to the Ecclesiastical Titles Bill swept over the country. Mr. GLADSTONE and Mr. DISRAELI joined in endeavouring to lessen the force of this wave. Apart from the question of Protection, which must sooner or later have been allowed to rest, it seemed doubtful to which party Mr. GLADSTONE would ultimately adhere. In some minor points the current topics of interest in 1850 are curiously reproduced in the current topics of the present year. The BULWER-CLAYTON Treaty was concluded to determine the questions which it was foreseen might arise out of the construction of the very canal with which M. DE LESSEPS is now busying himself. Mr. DISRAELI found in the then depressed state of agriculture an occasion for a great oratorical effort, and Mr. BRIGHT spoke at Manchester on Ireland in language which reads as if it might have been used by him a month or two ago. He recommended as measures proper for what he termed the redemption of

Ireland, abolition of primogeniture, restriction of the power of settlement to lives in being, security of tenure for the cultivators of the soil, and extension of the suffrage. Mr. BRIGHT is like the Pyramids, and looks down unchanged on a world of change.

In 1860 the most noticeable events in the public life of the QUEEN and the PRINCE CONSORT were the review at Holyrood of the Northern Volunteers—a bright episode in their lives, in which something of romance was added to demonstrations of more than usually fervent loyalty—and the despatch of the PRINCE OF WALES on his prosperous and well-timed visit to Canada and the United States. But readers of the Life of the PRINCE CONSORT know that in no year did the PRINCE CONSORT in his quiet, resolute, effectual way bring a greater influence to bear on the course of English foreign policy. 1860 was the year of GARIBALDI'S adventurous expedition, of the annexation of Naples, and of the destruction of the Papal army; but it was also the year of the annexation of Savoy and Nice; and if the PRINCE was less pronounced in his sympathy with Italy than the Liberal leaders, no one did more than he to determine the Government to assume a new attitude towards the EMPEROR of the FRENCH, and to enforce the necessity of what Lord PALMERSTON called a policy of precaution and foresight towards a sovereign who began to show himself a disturber of the peace of Europe. Nothing caused in England so much irritation as the suspicion that the EMPEROR had tried to bribe England into a humble acquiescence in the annexation of Savoy by the conclusion of the Treaty of Commerce with Mr. COBDEN, which M. LÉON SAY is now endeavouring to renew. Whatever year we take, we may be sure to find in it some cloud rising on the horizon of Turkey, and in 1860 the murder of the Maronite Christians by the Druses offered the occasion of a new, and this time an armed, intervention. In home affairs the year was made memorable by the Budget speech which set the crown on Mr. GLADSTONE'S financial reputation, by the introduction of GLADSTONE Claret to the ignorant British public, and by the fierce struggle with the Lords over the Paper Bill. It was the year of Mr. GLADSTONE'S greatest promise, just as 1870 was the year of his greatest performance; 1870 was the year of the Irish Land Bill and the Education Bill, the year in which the Ballot was first proposed by a Government, and Mr. GLADSTONE'S old object of aversion, the Ecclesiastical Titles Act, was repealed. A surplus of more than four millions enabled Mr. LOWE to propose large and popular remissions of taxation; but, by an odd coincidence, the Duke of ARGYLL had to announce that there was an unexpected deficit of a million and a half in the Indian Budget. The Indian Budget is like Turkey, and, whoever may be the Minister, it has a provoking habit of being always wrong. Of course every other event looks insignificant in a year which witnessed the great struggle between France and Germany, the collapse of the Empire, and the investment of Paris. Had the PRINCE CONSORT then been living, we may be sure that he would have heartily approved the impartiality of England and the decisive measures taken to defend the neutrality of Belgium. We may be equally sure that, when Russia in the most arrogant and unceremonious manner proclaimed her intention of violating the Treaty of Paris and sending her ships of war into the Euxine, the PRINCE CONSORT would have improved the answer of the English Government as much as he improved that given in the affair of the *Trent*, and would have imparted to Lord GRANVILLE'S despatch a tone of firmness and reserve in which it was deficient. Ten years have passed away, and Mr. GLADSTONE is once more Prime Minister and Lord GRANVILLE is once more Foreign Secretary. How utterly impossible it is to forecast the events that may mark their tenure of office during the rest of the year is singularly illustrated by the fact that on the QUEEN'S birthday in 1870 not one of the great events of that year was anticipated even in the most remote and dim manner by any political speculator in Europe.

SOUTH AFRICA AND THE MINISTRY.

IN the House of Lords on Monday evening the SECRETARY for the COLONIES and Lord CARNARVON, in an exchange of courteous remarks on the affairs of South Africa, seemed scarcely able to discover a trace of the difference which ought, according to established precedent, to exist between the Government and the Opposition. Lord KIMBERLEY with some reason doubted whether Lord CARNARVON had not, in the annexation of the Transvaal, acted on erroneous information; but he agreed in the expediency of retaining the possession since it has been once for all acquired. The serene atmosphere of the House of Lords might perhaps have been inconveniently disturbed by a reference to the more exciting question of the maintenance in office of Sir BARTLE FRERE. Many Liberal members are offended at the apparent inconsistency between the strong language of the former leaders of the Opposition and the decision of the same statesmen in their Ministerial capacity. Some of the malcontents assert that the alleged misconduct of Sir BARTLE FRERE in a great degree accounted for the result of the general election, and that the constituencies will consequently be disappointed by his immunity from censure. Sir WILFRID LAWSON has given notice of a motion for the recall of the HIGH COMMISSIONER; and, if he proceeds with it, it is probable that strong language will be used in the course of the debate. Though Mr. GLADSTONE has endeavoured to pacify Sir BARTLE FRERE'S accusers by hinting at his possible future dismissal, or, as Sir S. NORTHCOTE said, "putting a rope round his neck," it may be assumed that the Government will substantially adhere to the intention which was announced by Mr. GRANT DUFF; and, on the whole, Lord KIMBERLEY and his colleagues have probably acted in accordance with the public interest.

As a general rule it is desirable, in colonial as in foreign affairs, that successive Administrations should, as far as possible, maintain a continuous policy. Lord CARNARVON introduced no abrupt change when he succeeded Lord KIMBERLEY, who in turn abstained from opposing the scheme of South African Confederation. It is true that Lord LANSDOWNE, Sir C. DILKE, and Lord KIMBERLEY himself, strongly blamed Sir M. H. BEACH and his colleagues for their alleged weakness in condoning the active or virtual disobedience of Sir BARTLE FRERE; but the lapse of fifteen months may well have affected the expediency of recall, even if the Liberal party were then in the right. In this and in other matters it is not for the interest of the Opposition to taunt the Ministers with their alleged inconsistency in following the example of their predecessors. Every instance of the kind may properly find a place in some future apology for Lord BEACONSFIELD'S Government; but at present it will be injudicious to head the fox. If Sir MICHAEL HICKS-BEACH was well advised in keeping Sir BARTLE FRERE in office, the same reasons will justify the conduct of Lord KIMBERLEY. Mr. COURTNEY, who not unnaturally resents the apparent desertion of his cause by his former supporters, may console himself with the consciousness that almost alone in the late and in the present House of Commons he has consistently protested, not only against the Zulu war, but against the annexation of the Transvaal which was its indirect cause. Nevertheless some of the charges which he brought against Sir BARTLE FRERE really tend to account for the importance which is attached to the continuance of his services. It is stated with perfect truth that Sir BARTLE FRERE dismissed Mr. MOLTENO, and appointed the present Prime Minister in his place. The support given to Mr. SPRIGG by the Cape Parliament after a dissolution proved, by the only legitimate test, that the conduct of the GOVERNOR had been strictly constitutional. The personal influence, or the sound estimate of colonial opinion, which could alone account for Sir BARTLE FRERE'S success, is a quality of which his official superiors are bound to make use. If confederation is possible, he is more likely than any other Governor to overcome the objections to the scheme which are entertained in the Cape Colony. It is perhaps to be regretted for the immediate purpose that he no longer exercises authority in the Transvaal. His self-confidence and vigorous resolution have on one important occasion involved the Colonial Office and the country in serious difficulties; but the same qualities may be useful for an enterprise in which he may be trusted to follow his instructions. He appears to possess in a high degree the art of winning the confidence of jealous and susceptible colonists.

Before the Cabinet determined to pursue the scheme of confederation, it was necessary to form a resolution on the difficult question of the Transvaal. Lord KIMBERLEY had not found fault with the annexation when it

accomplished by Lord CARNARVON; but probably neither statesman would have entered on the undertaking if all its consequences had been then understood. The measure was invidious, and it was at least premature. It is true that the last President of the Republic seemed to invite the annexation, though in ambiguous language. The scattered community of settlers was suffering from insolvency, from anarchy, and from inability to resist invasion. The offer of English protection seemed to be beneficial and generous; but it was not appreciated, because Lord CARNARVON or Sir THEOPHILUS SHEPSTONE imposed the authority of a stronger Government instead of waiting for an inevitable invitation. At that time the interests of the large native population of the province were not taken into consideration. The objection to the re-establishment of the Republic which is now founded on regard for their welfare is, as Mr. COURTNEY says, an afterthought; but Mr. FORSTER may nevertheless have had reason for calling attention to the subject. Thoughts which occur after the first conception of a scheme may be essential to a complete estimate of its merits. The responsibility, if any, of the English Government for the welfare of the natives, was created by the assumption of sovereignty over the country in which they lived. The afterthought, therefore, relates to a condition of things which followed annexation. It is no new discovery that duties may result from acts which in themselves were perhaps neither necessary nor justifiable. From the date of the proclamation of the QUEEN'S authority every inhabitant of the Transvaal, white or black, acquired a right to the privileges of an English subject. Before protection is withdrawn the possible consequences to all sections of the population must be considered. The English traders of the towns and villages would protest more loudly than the natives against the restoration of a Dutch Republic which would regard them with little good will. The Boers themselves have been excited against English rule, and they would prefer almost to dispense with any form of government; but the patriarchal rule of every head of a family in the centre of a vast estate unfortunately implies a system which is scarcely distinguishable from slavery. As long as the Transvaal was independent, its English neighbours were not bound to superintend or criticize its domestic institutions; but it is doubtful whether it is right deliberately to permit the restoration of questionable social practices. Although it cannot be denied that there are possible or plausible arguments on the other side, yet since two successive Governments have arrived at the same conclusion there is no longer a practical issue to determine. It is now settled that the Transvaal is to be retained, and also that it is to be included in any confederation which may be formed in South Africa. The embarrassments which must be encountered will tax all the ability of the Government and of its representatives. As in the correspondence with the Austrian AMBASSADOR, Mr. GLADSTONE has had the opportunity of patriotically abandoning as Prime Minister opinions which he expressed with some vehemence in a state of "comparative freedom "from responsibility." As late as March 30, Mr. GLADSTONE at Peebles said, "If those acquisitions" (Cyprus and the Transvaal) "were as valuable as they are value- "less, I would repudiate them because they are obtained "by means dishonourable to the character of our country." Between March and May, having assumed the responsibility of office, Mr. GLADSTONE announces the intention of retaining the sovereignty of the Transvaal.

The American Union and the Dominion of Canada furnish precedents for federal organization under ordinary conditions; but it is necessary that each member of a confederacy, as well as the central body, should enjoy popular and representative government. No English politician would willingly hinder the extension of full constitutional privileges to the Transvaal, if only the inhabitants were ready to co-operate in the arrangement; but Sir GARNET WOLSELEY publicly acknowledged the impossibility of vesting supreme power in the Boers as long as they openly rejected the authority of the Imperial Government. Lord CARNARVON referred to the almost forgotten insolence of a representative Assembly of the Ionian Islands, which, as soon as it was constituted, expressed its desire to renounce the connexion of the Republic with the protecting Power. There is no doubt that a Dutch Legislature in the Transvaal would exhibit similar contumacy, if indeed the electors condescended to return members in obedience to writs issued by the English Government. For the present the province must be subject to a provisional administration, and officers appointed by the Crown will scarcely be recognized by other colonies as representatives of one of the confederate communities.

The Transvaal is not the only province which may perhaps throw impediments in the way of the project which has found favour with successive English Administrations. The Government of the Cape, which properly claims the initiative, has proposed a Conference, and its present Ministry appears to concur in the policy which is vigorously promoted by Sir BARTLE FRERE; but it is doubtful whether Mr. SPRIGG's popularity will survive the difficult negotiation which he has undertaken. The Cape Parliament will scarcely consent to deal on equal terms with Griqualand or Natal, and the separation from the colony of the Eastern province as an independent member of the Confederation would provoke strenuous opposition. The native difficulty affects the Cape Colony but lightly in comparison with the pressure on the thinly-inhabited districts which find themselves in the midst of uncivilized and warlike tribes both within and without their borders. If nevertheless Lord KIMBERLEY succeeds in accomplishing the union of the South African provinces, he will have deserved well both of the mother-country and of the colonists. The failure which is an alternative possibility might suggest the question whether the same object might not be attained by the annexation of some or all of the provinces to the Cape Colony. Such a measure would gratify the self-esteem of the colonists; and it might be not impossible to combine it with the establishment of local institutions. The Imperial Government is only so far interested in the question that it is entitled to relief from the burden of Caffre or Zulu wars. It may be doubted whether any of the colonies are disposed heartily to facilitate a result which is both just and indispensable.

THE GOVERNMENT BURIALS BILL.

THE Dissenting wing has had a prompt and bountiful instalment of those good things which it understood to be in store when it was dubbed the backbone of the Liberal party and lauded for not frightening its neighbours by crying "disestablishment" at the General Election. In the good old times, when the candidate grew effusive over the incorruptibility of the borough, and his friend from London got into a way of tapping his pocket, the electors apprehended the situation and were discreet. Mr. GLADSTONE did not even mention a Burials Bill in his significant appeal to the Nonconformists of Marylebone; and yet no more than a week of real Parliamentary work has passed before it has been brought into the House of Lords, and in another week it is to be read a second time.

Lord SELBORNE is the Minister upon whom the task of introducing the measure devolved; and he has justified the choice by the courageous ingenuity with which he marshalled for the purposes of the debate the history of the question. The space within which he moved was a world of pure intentions on every side, though strangely condemned to exist under laws alike unfair and indefensible. Loving Dissenters embraced sympathetic Churchmen all round, and not a breath of politics disturbed the pious accord. No SPURGEON, no LANDELLS, and no DALE had ever formulated insulting menaces against the Established Church; no Liberation Society had ever proclaimed, with a cynicism which we had, till we heard Lord SELBORNE, thought more bold than wise, not only that it meant to disestablish the Church, but that it was fighting for the Burials Bill as a sure and large instalment of the object which it was openly seeking. Except in a few curt and obscure words near the close of his speech, the LORD CHANCELLOR did not condescend to notice the fact which, as far as the present contest goes, makes the strength of the Church's plea and the weakness of its assailants—the abandonment in the most practical form by the Dissenters of the theory that the churchyards were national property, when they abolished compulsory Church rates, and so contracted themselves out of the obligation to maintain those grounds. In doing this they took care also to throw on Churchmen the exclusive obligation of having still to find burial space for their non-contributory fellow-citizens. When the CHANCELLOR grew pathetic over the restrictions

which forbid any service but that of the Church within the churchyards, he omitted to notice that the complainants were the sects whose proud boast had all along been, till the value of the Burials cry became apparent, that they and their fathers had ever witnessed against the Papistical idea of ceremonialism in funerals. While Lord SELBORNE brandished in the face of the Opposition the narrow majorities with which the Burials Bill, or the analogous resolution, had in successive years been rejected in the House of Commons of 1874, he found it convenient to forget that these narrow majorities were made up of members from Scotland and Ireland as well as from England, and that, as in each of those countries a burial system widely different from that of England prevailed, so these representatives on either side of the House did not very clearly understand or care very much for what they deemed an English difficulty. Had he subtracted the Scotch and Irish contingents, he would have found how enormous were the majorities against the Burials Bill among the English members, for whom alone the question was one of practical importance. So patent was this fact that upon one occasion Mr. O'DONNELL astonished the world by voting against Mr. OSBORNE MORGAN, and then explained his action by a letter to the newspapers, in which he claimed to be returning good for evil by giving to Englishmen a practical illustration of the real working of Home Rule.

After making all allowances for the exigencies of a very difficult political situation, we object to this method of cooking a question by a man so eminently respectable as the LORD CHANCELLOR, as intrinsically immoral. Though Lord SELBORNE attempted to gloss over the fact in his outburst of emotional charity, it is vain to deny that the adoption by a Liberal Government, simultaneously with its accession to power, of the principle of Mr. OSBORNE MORGAN'S Bill is the triumph of the anti-Church section of the dominant party. Accordingly the conduct of the measure ought to have been allotted to some representative within the Ministry of that section; to Mr. BRIGHT, for instance, or Mr. CHAMBERLAIN, or, still more appropriately, although he is not in the Cabinet, to Mr. OSBORNE MORGAN himself. But, if it were thought better policy to leave the question to Lord SELBORNE, a confession of facts as they are would have secured more respect for the policy and won more genuine confidence to the project.

The operation of the Bill is to extend to cemeteries as well as churchyards, and will involve absolute free-trade in burial everywhere. Church service, non-Church service, or no service at all, are to range over the entire area alike of consecrated and unconsecrated ground. This large concession carries with it the advantage that it avoids the recognition as such of the Dissenting minister, and throws the onus of the choice upon the dead person's representatives. The nugatory restriction invented by Lord HARROWBY that the services are to be "Christian and "orderly," with some solemnly trifling provisions against provocative praying, are to appear in the Bill, and will no doubt duly exercise clerical and legal ingenuity. Perhaps a dead Jew's burial service, even if he had been a Jew of Sheffield, would be interpreted to be Christian for the purposes of the Act, while the only thing not orderly about a Roman Catholic funeral may possibly be the conduct of those friends of Mr. GLADSTONE who will not see in the right given to monk and friar to perambulate the churchyards a sufficient compensation for Lord RIPON'S appointment.

The peremptory refusal, of which the LORD CHANCELLOR was mouthpiece, to make any distinction between ancient and modern churchyards, may no doubt be beneficial to the Church's enduring right to retain its old as well as its modern churches, when the disestablishment party may find itself strong enough to formulate the terms of ultimate confiscation. But Lord SELBORNE need not have been so fierce in the censure which he administered to living donors of churchyards for the offence of having made these gifts upon the presumption that the condition of affairs which prompted their generosity would not be rudely or soon shaken. "The Church is "established," he said in effect, "and you ought to have "known that and have been prepared to enjoy the spec-"tacle of the secular authority altering the distribution of "your own gift before your living eyes. Had you belonged "to a non-established body the case would have been dif-"ferent." After all, generosity is not so very heinous a crime, and the natural commentary upon Lord SELBORNE'S dictum would be, that after all it might be safer to face disestablishment. It is, however, undeniable that the claim so bluntly set up by the LORD CHANCELLOR would be a cogent precedent with those Liberationists whose astuteness led them to eschew the mistake of prematurely raising the question of dispossession for putting forward a claim to a joint use of the churches, which would effectually attain the same end.

We cannot, on Lord SELBORNE'S vague description, consider the projects of alternative Church burial services, crudely borrowed from some recommendations of Convocation to which the attention of the country has hitherto been very cursorily directed. Whatever else may come of this Bill, we feel that we are on safe ground when we prophesy that its fruits will not be peace, goodwill, and general contentment. To the Liberationists it will be only the whet before the full feast of disestablishment, and to the Church a present detriment and a bitter recollection.

MR. BRADLAUGH'S CASE.

IT is much to be regretted that the Act which allows of affirmations without religious sanction in courts of justice was, by inadvertence, not so framed as to include the Parliamentary declaration of allegiance. It was also unlucky that the Select Committee which considered the question divided, with one exception, according to the political opinions of its members. In the House itself the two parties, for the most part, incline to opposite opinions, in spite of Mr. GLADSTONE'S exhortation to deal with the subject exclusively on judicial grounds. The decision of the first Committee by the Chairman's casting vote was probably correct; and, as both Sir DRUMMOND WOLFF and Mr. GLADSTONE remarked, it may have been fortunate for Mr. BRADLAUGH that he was not allowed, by taking his seat, to incur the risk of penalties which the House of Commons would have had no power to remit. No such complication would have resulted from the admission of a member in accordance with statutory conditions; but, as Sir DRUMMOND WOLFF formally objected to the administration of the oath, it was thought expedient to institute a second inquiry into Parliamentary law and custom. By proposing the appointment of a Committee Mr. GLADSTONE so far gave his sanction to the protest as to concur in the opinion that there was a difficulty or a doubt to be solved; and yet it is certain that, but for the intervention of a private member, Mr. BRADLAUGH would have taken his seat without liability to future question of his right and with little risk of penal consequences. The statute which imposes on members the oath or declaration of allegiance is peremptory and unconditional. The applicant for admission to the House of Commons is not bound to hold, to utter, or to suppress any theoretical opinion; nor is it competent to any other person or to the House itself to question either his good faith or the binding effect of the obligation which he incurs. The present case is complicated by Mr. BRADLAUGH'S declaration in the House that the oath was not binding on his conscience. If he had made the statement in any other place, or in a letter to the newspapers, it could not properly have been noticed.

It was only by accident that the formal sanctions of oaths became religious tests. The purpose of legislators was to exclude those who objected to some definite proposition, as, for instance, to the royal supremacy or to the title of the reigning family. It was afterwards found that Jews would not pledge "the true faith of a Christian," and Mr. BRADLAUGH at first objected to the more comprehensive formula of "so help me GOD." If the first Jewish member to whom the oath was tendered had been willing to take it in the usual form, there is no reason to suppose that he would not have been allowed to conform. It is for Parliament to provide a remedy for an indecorous result which had not been anticipated. Many members probably agreed with Mr. WALTER that a mere declaration of allegiance might be advantageously substituted for an oath; and some bolder innovators may have further doubted whether any test or promissory statement is now necessary or useful. The expediency of oaths or of equivalent forms in judicial proceedings raises a separate question. Witnesses would probably be more careless and more inaccurate than at present, if they were not solemnly reminded of their moral and legal responsibility; and to

the great majority of the population an oath is the most sacred and most intelligible guarantee of truth. The oath of allegiance is not likely to affect the Parliamentary or political conduct of any member. It is useless to pursue the inquiry further, as no change in the existing practice is at present likely to be proposed. If a public profession of allegiance is thought useful, no impediment ought to be placed in the way of general acceptance of the pledge. A large portion of the House may perhaps have sympathised with Mr. Gibson's eloquent denunciation of opinions which involve a disbelief in all religious sanctions; but it is notorious that many members who have taken the oath of allegiance can have attached no special value to its terms. Atheism, or, as it is more fashionably called, agnosticism, is openly avowed by scientific and popular writers; and not long since a strong-minded woman was allowed to publish in a well-known periodical a professed apology for modern atheism. It is not necessary to discuss the question whether any class or sect ought to be disqualified for the exercise of official or representative functions. It is quite certain that no such disability could now be imposed; and, on the whole, it is well that inquisition into religious opinions should have fallen into total disuse.

It was to be expected that some speakers should diverge from the principle which was the proper subject of debate into the special circumstances of the case. The other member for Northampton remarked that the constituency which he is perhaps proud to represent had chosen his colleague, not for his religious, but for his political, opinions. If more extravagant doctrines of either kind could be invented, they would probably be still more acceptable to Northampton flesh and blood. It happened that some of Mr. Bradlaugh's political opinions were submitted to the House in illustration of his alleged dissent from the substance as well as from the terms of the oath. It appears that he has contended for the right of Parliament to set aside the succession to the Throne, and that the genuineness of his allegiance may therefore be plausibly disputed; but the Act of Parliament requires that an oath or declaration shall be administered, and not that its language shall be consistent with the former declarations of the member who accepts it. It is legally possible that an adversary of monarchical institutions might be provisionally or permanently converted by the obligation of a voluntary promise. More than one member of the present Government has declared his preference for a Republican form of government; but there is not the smallest risk of any Ministerial conspiracy against the throne. Mr. O'Donnell indulged in more personal criticisms, which were irrelevant, though they may possibly have been not undeserved. It is out of the question to overrule the choice of a constituency on the ground of character or conduct. The experiment failed signally a hundred and twenty years ago when Wilkes was expelled from the House of Commons for publishing a libel which was designated as profane and indecent. The claim of jurisdiction by the House was not disputed, but the subsequent refusal to admit the offender on his re-election produced a dangerous strain on the Constitution. The safer course which was followed when the Jewish member for the City of London refused to take the oath is not in the present case practicable. Mr. Bradlaugh might have continued to be member for Northampton, though he was not allowed to take his seat, if he had persisted in his objection to the oath. An adjudication by the House that he could not be allowed to comply with the conditions of occupying his seat would be equivalent to expulsion.

If the Crown and Parliament possess supreme and absolute power, of which the larger share is appropriated by the House of Commons, the constituencies are invested with an anterior and irresponsible sovereignty. In the early part of the present century a half-crazy borough-monger was said to have threatened that he would return his negro footman to Parliament. If his nominee had been a natural-born subject, and if he had been willing to take the prescribed oaths, the choice of the nominal electors could not have been disputed, though such an outrage might probably have precipitated a measure of Parliamentary reform. The present constituencies are not liable to be disestablished, however grossly they may abuse the privileges entrusted to them by modern legislation. The worst that can happen to unscrupulous electors is that they should be reinforced by the admission of a still lower and more reckless rabble. Stoke-upon-Trent five or six years ago, and Northampton at the present election, have reduced to an absurdity the fundamental principle of a democratic constitution. As it is impossible to retract concessions of power to the multitude, it only remains to counteract, if possible, by the aid of more scrupulous constituencies an evil which may be endured unless it spreads. The majority has no censorial functions, though the House is entitled to notice and punish offences committed against itself. The social relations of an objectionable member are not likely to be attractive or enviable. A member of the last Parliament who could not find a colleague to introduce him must have suffered during his time of representation punishment fully adequate to his demerits. Less disreputable demagogues, though they are not excluded from ordinary intercourse, have often been politically extinguished by exchanging the direction of dupes for the society of equals and superiors. When they become more numerous in Parliament, they will also be more dangerous, because they will keep one another in countenance. The caprices of the multitude are exhibited in France on a still larger scale. The second city in the Republic insists on returning to the Assembly a mischievous old fanatic who is not even legally qualified for a seat. At the next election several Communists will probably be elected, in reward of their share in one of the most criminal of civil wars. The danger is not yet so imminent in England; and, such as it is, it cannot be averted by any kind of oath or declaration.

AMERICAN DIPLOMACY.

It is impossible for foreigners to share even the languid interest which Americans take in Presidential elections. The difference of opinion between Republicans and Democrats is barely intelligible; and it is still more difficult to distinguish the claims of candidates for nomination. At present Republican politicians concern themselves more with the prospects of the party Convention at Chicago than with the final trial of strength in the election of a President. The chances of the three principal candidates are so doubtful that some obscure rival may not improbably at the last moment be preferred. It is objected to Mr. Blaine that he has, like most conspicuous Americans, been accused of questionable pecuniary transactions. Mr. Sherman is charged with using his official influence in support of his candidature; and General Grant's success is endangered by the scandals of his former administration, and by the prejudice against a second re-election. The hope that he would be selected by popular acclamation has not been confirmed; and the skilful manipulation by his friends of important State Conventions appears to have been partially counteracted by other influences. Some of the Philadelphia and New York delegates have announced their intention of disregarding the instruction to vote for Grant. On the other hand, the result of the Illinois Convention is thought by those who understand the mysteries of electioneering to be favourable to his pretensions. The candidate who obtains the largest number of votes on the first ballot scarcely ever obtains nomination, unless he is supported by an absolute majority of the whole Convention. Of the whole number of votes Grant had lately secured more than two-fifths; but it was doubted whether he would obtain one-half. The Democrats have determined to await the result of the Chicago Convention before they nominate their own candidate at Cincinnati. Mr. Tilden is supposed to have the best chance of nomination; and any Democrat who may be chosen will be supported by the whole strength of the party. Patriotic citizens will expect the decision with equanimity, in well-founded confidence that the country will continue to flourish under Grant, or Blaine, or Sherman, or Thurman, or Tilden.

As if to relieve the dulness of domestic politics, the diplomacy of the United States is always aggressive and pugnacious, if not litigious. Whether a new rule of international law is to be enacted, or an existing treaty to be interpreted, the Secretary of State, to whatever party he may belong, prefers demands which are thought expedient with the confidence of entire security. No Government willingly comes into collision with a Power which cannot be assailed or coerced; and consequently it is thought unnecessary to consult foreign susceptibilities. Lord Granville inherits from the late Government, which would

willingly have avoided occasions of difference with the United States, two controversies of different kinds. The PRESIDENT and his Cabinet have, in defiance of theory and precedent, lately asserted a virtual claim of sovereignty over the Isthmus of Panama which belongs to an independent State, and which is specially protected by a treaty between England and the United States. As it is impossible either to find an excuse for the demand in the common law of nations, or to explain away the provisions of the CLAYTON-BULWER Treaty, the American Government proposes arbitrarily to rescind the agreement, and boldly extends the so-called MONROE doctrine to the case of a projected canal between the Atlantic and Pacific. If no resistance is offered, the trade of England and of Europe would, in the event of the construction of the canal, be made subject to the irresponsible control of a commercial rival who might be a political enemy. Nothing would be easier than, by another strain on the elastic MONROE doctrine, to declare that the canal was a link in the coast navigation of the United States, and that it was consequently subject to the jurisdiction of the Federal Government, and to any tariff of tolls which might be enacted by Congress. The proposition would not be more novel than the assertion that the Americans have a right to prohibit M. DE LESSEPS's enterprise. It will be necessary for the English Government carefully to avoid any direct or indirect acknowledgment of pretensions which have no foundation in public law or in justice.

Another and more pressing dispute is founded on a clause in the unfortunate Washington Treaty. There is a certain difficulty in the question; and the SECRETARY of STATE, with the approval of the PRESIDENT, decides the case in favour of the United States, and at once proceeds to enforce his judgment by reprisals. It might have been supposed that the humiliation of England in the Washington negotiation and its consequences might have satisfied the most exacting litigant. The English Government submitted to the enactment of an *ex post facto* law for the decision of an existing controversy; and at the arbitration it was in the first instance encountered by an insolent demand, which was too extravagant even for arbitrators who afterwards awarded damages of nearly double the amount which the American Government considers itself able to distribute. There can be no doubt that the admitted failure of justice ought to have been corrected by the voluntary repayment of the surplus; but the English Government was well advised in considering that the litigation was at an end; and the United States could not be expected to discharge a debt for which it was only morally liable. The arbitrators in the case of the Canadian fisheries appointed under the same Treaty awarded a sum far smaller than the claims of Canada; and, because the American arbitrator had, probably in accordance with instructions, declined to concur in the award, the American Government first hesitated to recognize the validity of the judgment, and then appealed to the English Secretary of State to waive the undoubted rights of the Dominion. Lord SALISBURY with good reason demurred to the extraordinary proposal, and the money was paid with an ungracious protest against the justice of the award. If the decision of a tribunal voluntarily selected had not been binding, there would have been much better reason for objecting to the iniquitous Geneva award.

By another clause in the treaty, American subjects acquired a right to fish for a term of years on the banks of Newfoundland; and English colonists were at the same time admitted to share a less valuable right of fishing in American waters. By a local law of Newfoundland anterior in date to the treaty, fishing was forbidden during a close season; and some Americans who fished in defiance of the regulations were violently driven off by Newfoundland fishermen. Mr. EVARTS preferred a claim for damages which might probably have been settled by agreement, and at the same time he insisted on the right of American fishermen under the treaty to disregard the local law. In a succession of argumentative and indignant despatches he contends that an absolute grant by a sovereign Government cannot be controlled by any condition not originally inserted in the text. Lord SALISBURY admitted that no intentional or vexatious restraint could be applied to American fishermen by legislation subsequent to the Treaty; but he urged, certainly not without plausibility, and apparently with good reason, that the grant must be construed by the state of affairs which existed when the Treaty was concluded; and that it would be monstrous to exempt foreigners from restrictions which were presumably imposed on native fishermen for the benefit of the industry in question. It might well happen that the prosecution of the fishery during the close months would render the regular fishing operations worthless. The colonial Government had given the best proof of its good faith by enacting the regulations, to the possible detriment of its own subjects, when there were no American strangers to restrain or to exclude. The effect of compliance with Mr. EVARTS's demand would be to overrule the local law even as regarded native fishermen; for it is difficult to suppose that the inhabitants of Newfoundland would stand patiently by while their waters were swept by foreigners in virtue of a legal quibble.

Mr. EVARTS is well aware that one of the principals in the treaty is not identical with the communities which are immediately interested in the controversy. *Delirant reges*, the English plenipotentiaries neglected to guard against the subtleties of special pleading; *plectuntur Achivi*, the fishermen of Newfoundland are to be robbed of the sea-harvest by which they live; or, in default of submission to the American demand, Canadians are to be denied the right of bringing their fish to American markets. If the SECRETARY of STATE, who coolly proposes to rescind the CLAYTON-BULWER Treaty, is nevertheless anxious to guard the sanctity of the letter of treaties, even when it conflicts with the spirit, it would have been easy to agree on a supplementary contract by which the Newfoundland question might be settled; but it seems that no law is valid in opposition to the real or supposed interest of the United States, and also that any law which can be interpreted to the advantage of the United States must be liberally construed and strictly enforced. The refusal to execute an undisputed provision of a treaty because there is a difference of opinion as to the interpretation of another clause is somewhat beyond the limits of sharp practice; but the traditions of American diplomacy are consistent in the harshness of communications with England. Pertinacity has for the most part produced no retaliation, for the strong language recorded in the archives of the Foreign Office is almost wholly on the American side. There may perhaps be some convenience in the change of Ministry if it gives an opportunity of forgetting any irritable feeling which may have been caused by Mr. EVARTS's method of negotiation. It seems impossible to enforce on the Newfoundland fishermen acquiescence in a monopoly established in the interest of American citizens; but perhaps one of the numerous oversights in the treaty may be set right in return for some other concession.

M. LÉON SAY'S ELECTION.

THE election of M. LÉON SAY as President of the Senate may serve to avert a conflict between the two Chambers of the French Legislature. Until a day or two before the election it seemed likely that M. JULES SIMON would be nominated as a candidate, and that he would receive the support of the Right as well as of that moiety of the Left Centre which regards M. DUFAURE as its leader. As the Senate is at present constituted these two sections, if they act together, can command a majority. The Government, it is supposed, would have preferred M. LEROYER; but their object was of course to detach as many of the DUFAURE group as possible from the coalition, and for this purpose M. LÉON SAY was the best candidate they could have. His reputation as a financier is an excellent answer to the doubts which the Right are always trying to excite of the Ministerial soundness on questions of taxation and property. The position of the Right is in this respect a difficult one. They have to sow suspicion of the Republic among classes of Frenchmen who have no sympathy with their special views. The reasons why a Legitimist or a Clerical dislikes the Republic are patent to everybody; but they are not reasons which have any force outside the Legitimist or Clerical factions. The shopkeeper and the peasant are not in the least disturbed at the social anomalies which seem so shocking to men accustomed to Courts. A President who maintains no external state, and is denied the income which would enable him to maintain any; a Cabinet in which none of the historical families of France are represented; a Government which knows nothing of society, and is in its

turn ignored by it—are phenomena which to many Frenchmen must seem to presage the end of the world. It is true that under the Second Empire the Royalists stood apart from the Government, but they did so of their own free will. There was a Court which they might have attended and a society in which they might have mixed if they had been so minded. The Empire at least paid the old order of things the compliment of imitation; the Republic proclaims to every one that it would not revive it if it could. But if the Right were to tell the nation generally of the loss which it has thus sustained, they would find no listeners. If they are to make converts in an unbelieving generation, they must appeal to some sentiment which is shared by those whom they address. They find this in the alarm which is so easily excited in the minds of Frenchmen by the prospect of an attack upon property. It is much more difficult than it used to be to create this alarm. Among the many bad qualities of the Republicans, one of the most conspicuous is the fact that many of them are rich. During the recent elections in this country we were made familiar with the argument that the heir to the Dukedom of DEVONSHIRE was not likely to support any revolutionary attack upon landlords; and in every district of France Republican canvassers can point to some well-to-do member of their party and ask a hesitating voter whether such a man is likely to lay any unfair burden upon realized property. It may be supposed, however, that just as Lord HARTINGTON's prospective wealth has not entirely reassured English Conservatives, so there are French Conservatives who draw no consolation from the number of well-to-do Republicans whom they see around them. It is possible that M. LÉON SAY's reputation may prevail with some who have not allowed themselves to be influenced by less famous names. That the best known financier in France should be the Republican candidate for the Presidentship of the Senate is a fact which the most ingenious croaker of the Right will find it hard to deal with.

It is especially fortunate that M. MARTEL's successor should not have been M. JULES SIMON. All M. SIMON's cleverness could not have prevented his election from being taken as a direct challenge to the Government. It would have been regarded all over France as an intimation that every Ministerial measure must be submitted to the censorship of a hostile majority in the Senate. This would have been a state of things which the Right would have seen with natural and even legitimate enjoyment. They are not concerned to keep the present Constitution in good order. Their object is directly the reverse of this. Every hitch in the working of the new machinery is valuable as evidence that the machinery itself is unsuited to the nation upon which it has been forced. A deadlock between the two Chambers would be a real godsend to men in this temper of mind, and M. SIMON's election would have made the occurrence of a deadlock exceedingly probable. It will require very great prudence to guide the Senate through the difficulties which are likely to be in store for it, and even the greatest prudence may fail if the difficulties themselves should become at all more serious than they are already. M. SIMON might have proved an excellent tactician, but the fact of his election would have had precisely this result. The Chamber of Deputies would have taken it as a declaration of war on the part of the Senate, and it would have been eager to show, by sending up some more than commonly obnoxious measure, that it was not in the least afraid of its adversary. The relations between M. SIMON and M. GAMBETTA would have only made things worse. It is of great importance that the two Presidents should have no mutual dislike, and unless M. GAMBETTA and M. SIMON have had great injustice done to them by rumour, they must entertain a good deal of mutual dislike. In all probability, therefore, the Senate would before long have found itself compelled to choose between altogether abandoning its pretensions as a revising and moderating Chamber and giving effect to them at the risk of provoking a formidable outburst on the part of the Chamber of Deputies. Of course this choice may be forced on it under M. LÉON SAY as well as under M. SIMON; but the chances of its being so are less. The majority in the Chamber will not now be tempted, as it would have been if M. SIMON had been elected, to resent the rejection of a Bill by the Senate as an insult to itself as well as to the measure rejected. Nor will it be under any special inducement to show its independence of the Senate by insisting on its assent to some Bill which the majority of the Senators are known specially to dislike. Legislation will be allowed to take its natural course without being diverted into channels which have no merit beyond that of tending to set the two branches of the Legislature at issue with one another.

The gain of this will be that the longer the present Constitution can be protected from serious assault the more likely it is to last. The existence of a Second Chamber is very unpalatable to a large number of Republicans. In spite of its being elected in the last resort by universal suffrage, they profess to regard it as in some unexplained way a standing slight to universal suffrage. Now that the Constitution has been amended by the transfer of the Legislature to Paris, it can easily be amended again; and it is difficult to form an opinion how a proposal to alter it by the abolition of the Senate would be received if it were made in consequence of a quarrel between the Senate and the Chamber of Deputies. The longer the Senate lasts the more hold it is likely to get on the country. The groups of electors who return the Senators will less and less like the prospect of being deprived of the check they can now exert on the Chamber of Deputies, and if the *Scrutin de liste* should be substituted for the *Scrutin d'arrondissement*, this feeling will become more powerful still. It would be extremely unwise for the Senate to forego its claims as a revising Chamber merely to postpone the day of collision with the Lower House, since by so doing it would lessen the force of the argument in favour of retaining it. But on the other hand it is greatly to be desired that it should avoid every occasion of collision when no really important question is at stake. By taking M. SIMON as its President, it would have provoked a contest for no adequate motive, and risked defeat in a field where even victory would have brought no permanent gain.

INDIAN REFORMS.

LORD HARTINGTON may well have felt aghast at the number, complexity, and importance of the questions which awaited him at the India Office. The position of things in Cabul is just now replete with problems any one of which, if solved in the wrong way, may lead to the gravest results. How, and when, and on what pretext, to get the army of occupation back into British territory; what to do with Candahar; what line to take in the difficult negotiations with ABDUR RAHMAN; what precautions to adopt against the destruction of our partisans, which is the too probable result of our departure; how, in fact, to evolve order and safety out of a state of things not far removed from chaos—these are the topics on which the new Indian Minister must find himself obliged from day to day—almost, thanks to the telegraph, from hour to hour—to form decisions and to issue instructions, often of a very detailed character and almost always on materials insufficient for a weighty judgment. The political events of the last few weeks in England have evidently not been without their effect on the turbulent and fanatical mountaineers whose acquiescence is a first condition of any stable Government; and the prospect of any satisfactory settlement seems as remote as ever. On the other hand, the difficulty of maintaining so large a force in distant and inaccessible localities, amid a hostile population, is becoming every day more serious, and tends to render the early retirement of the English armies a consideration of paramount importance. The conjuncture is full of anxiety, and would make a large call on the calmness, fortitude, and resource of a statesman better qualified by special knowledge and experience than the new SECRETARY of STATE to deal with it.

But it is not on the North-West frontier alone that Lord HARTINGTON and the new VICEROY will find topics of difficulty. In the East, the tipsy maniac on the Burmese throne may at any moment—tired of the murderous orgy with which he began his reign—force us by some intolerable outrage or insult into a war which, to say the least of it, would be in the highest degree inconvenient. On the North the CASHMIR MAHARAJAH is believed to have been misbehaving; and in any case the deplorable misgovernment of his little kingdom is certain, sooner or later, to result in a political catastrophe of which the British Government will not be able to remain a passive spectator. No more dreadful stories of oppression, corruption, and crime are to be found in the annals of mal-administration than those which every traveller for the last

two years has brought back from the secluded valleys where in an ill-advised moment the British Government, thirty-five years ago, set up an absolute despotism of bigoted Hindus over a Mahommedan population. The famine which for several seasons has afflicted the province, and in some places almost exterminated the inhabitants, has thrown a dreadful light on the dark places of tyranny; and the British Resident has had to chronicle a series of infamous transactions against which in less troubled times the conscience of the Indian Government and the English nation would have revolted in more than a mere verbal protest. On the frontiers of Bengal the mountain tribes have broken the slender thread of allegiance which binds them to our rule, and in the Madras Presidency a band of outlaws have been sufficiently supported by popular sympathy to be able for many months to defy all attempts at coercion. There appears to be no doubt that the outbreak was occasioned by the oppressions of a local magnate insufficiently controlled by superior authority; and this circumstance, together with the prolonged inability of the authorities to restore order, is corroborative of an impression, long current in official circles, that the machinery of the Madras administration is somewhat antiquated and out of gear. Lord RIPON, if he completes the term of his viceroyalty, will probably be called on to consider the question, suggested by Lord NORTHBROOK last summer, whether the quasi-independence of this province and of Bombay is not a source of weakness, delay, and expense, uncompensated by any real advantage. At present the two Governorships are distinguished from the other provincial authorities by higher pay, more costly establishments, and a traditional *rôle* of insubordination whenever local prejudices conflict with Imperial interests and the requirements of the Supreme Government. There is no real autonomy, for the same policy is necessarily observed from one end of the Empire to another; and all recent reforms—financial or material—tend to increase the interdependence of the several provinces. But there is sufficient freedom from control to enable a refractory or self-willed official to offer successful opposition to a proposed reform, or to evade orders with which it is inconvenient to comply. Lord NORTHBROOK had probably learnt by experience how serious an impediment to efficient government such a state of things may be; if Lord RIPON sees his way to effect an appreciable economy in State outlay, and at the same time to improve the administrative machine at its weakest point, he will have made a valuable contribution to the cause of Indian reform.

Another matter of first-rate importance, of which the disposal can scarcely be delayed, is the reorganization of the Indian armies, and the suppression of the Provincial Commanders-in-Chief. The reforms proposed in this direction would, it is announced, admit of economies to the extent of 1¼ million sterling, a most welcome relief to the Indian Exchequer, at present burdened with an annual normal outlay for military purposes of over 15 millions. The present Commander-in-Chief in India, and, it is believed, a still higher authority in England, are opposed to the change, but military experts of the more enlightened school have long recommended it. Special considerations apart, it would certainly appear that the maintenance of distinct Commanders-in-Chief for the several branches of what is essentially a single army is one of those anomalous arrangements which tradition may endear and Conservatism defend with plausible apologies, but which cannot fail, like any other form of unskilful organization, to result in waste, disorder, and inefficiency.

Two leading representative bodies in India have taken advantage of the present change of rule to call attention to reforms which they consider especially desirable. One of these, supposed to represent the interests and views of the Bengal landholders, shows its grasp of the situation by recommending, amongst other changes, the extension of the Permanent Settlement to the rest of India. Lord RIPON is more likely to be occupied with measures for remedying the disastrous effects of Lord CORNWALLIS's ill-considered concession, and for compelling the landlords of Bengal to fulfil some fraction of the duties the performance of which was the main consideration for the privileges which they now enjoy. At present the Government is in the unfortunate position of having given away an annual sum of fourteen or fifteen millions in the hope of improving the condition of the people, and of having achieved no one of the objects with which the boon was granted. The Bengal landlords are as little inclined to agricultural improvements as any in India, and the tenants in many parts of the province are among the most rack-rented and poverty-stricken classes in the country. The Bengal Government has been for years occupied with legislative attempts to better the ryot's position, but has hardly got beyond the stage of demonstrating that the Permanent Settlement has injured the status of the agriculturists hardly less seriously than the interests of the Exchequer. The subject has never been dealt with in a searching and statesmanlike manner since Lord CORNWALLIS left it a century ago, and Lord RIPON will now find it among the most pressing claims on his attention.

The other complaints of these self-constituted spokesmen of Indian grievances are equally unsubstantial, and possess little interest except in showing the topics which popular agitators select as best adapted for an appeal to English sentiment. Nobody out of Bedlam ever doubted that the uncontrolled importation of firearms in considerable quantities had become a danger which it would have been criminal folly to neglect. The supervision of a few fifth-rate native newspapers, representing neither talent, property, nor even genuine native sentiment, was urged on the Government by the concurrent opinion of all the most experienced officials, who considered that the preservation of public order was being, or might easily become, endangered by a class of irresponsible and anonymous incendiaries. The admission of natives to the Civil Service was provided for last summer in a measure the working of which has yet to be observed. Another and more serious demand is for representative Councils, armed with the power of the purse. The first objection to such a proposal would be that the attempts at representative government made under the existing *régime* have been almost defeated by the difficulty of inducing proper representatives to take part in legislation; in the next place, the power of the purse must rest, along with the ultimate financial responsibility, with the Executive Government, by whom the money necessary for carrying on the administration has to be found. Such proposals, however, are hardly intended for any purpose more serious than the relief of vague restlessness, or the gratification of demagogic vanity. They have the remotest possible connexion with the real wants and wishes of the people, and these seldom travel beyond favourable seasons, light taxes, and freedom from the all-pervading oppression which is the universal characteristic of native rule. Careful inquiries have established the result that Indian taxation has at no period been lighter than at present, or the people better qualified to sustain it. The abnormally bad seasons of 1876–8 may not improbably be followed by a series of prosperous years; and, if this prove to be the case, the trade of India, whose growth was momentarily checked, will no doubt continue to develop at a rate which must speedily place her among the great commercial Powers of the world. The railways have already given a foretaste of what may be expected when the whole of that enormous continent is placed in communication with the coast. In the meantime, the administrators of the country are little likely to desert the safe path of practical improvement in the pursuit of the day-dreams of untutored brains and feverish imaginations.

THE LOWER RHÔNE.

THE present Government of France may have its shortcomings, and may be failing to deal with some of the larger political questions forced on it in a manner which to English critics would seem theoretically best; but some of its greatest merits are displayed in the obscurer regions of administration, and it is only when we add up the instances of its beneficial activity that we can realize how good is the work it is doing for France. M. DE FREYCINET has very large views of what may be done to promote the material prosperity of the country. He demands and obtains vast sums of money, which he devotes to works of public utility, and the peculiar object on which he has set his heart is the development of small local interests. His day may be described as a day of small things; but these small things combined make a great whole. He makes little canals, he builds cross-country railways, he gives decaying ports a chance of regaining importance or retaining a comfortable existence. It is only natural that his activity should

stimulate the activity of speculative engineers or village philanthropists. It seems to ardent students of his spirit of enterprise that now is the time when anything may be proposed that is likely to give new life to a forlorn little town, or make any trembling industry thrive. As an example of what Frenchmen are now thinking of in their sober hours, when they do not weary themselves with endless discussions of the 7th Clause, or with speculations on the mysterious intentions of M. GAMBETTA, some recent papers by M. LENTHÉRIC are not without interest or value. It is the dismal region of the Lower Rhône that occupies his attention, and it is to this mournful corner of France that he thinks the vigorous beneficence of M. DE FREYCINET may now be profitably directed. His special hobby is the town and port of Aigues Mortes. It is Aigues Mortes that he wishes to see endowed with new life and prosperity; and if it is a glorious thing to resuscitate dead little towns, nothing could be more glorious in its way than to resuscitate Aigues Mortes, for, of all dead little towns, it is perhaps the deadest. Guide-books inform us that this little city is an archæological curiosity, as well as interesting from its geographical position, as it is situated about three feet above the level of the Mediterranean, in the midst of salt marshes and lagoons, the exhalations from which render it unhealthy. M. LENTHÉRIC does not trouble himself much about its archæological pretensions; but it is its geographical position—which to the superficial observer seems singularly unhappy—that recommends it to his affectionate notice. He has convinced himself that Aigues Mortes is one of the most happily placed towns in France; and in his dreams of its future he soars to so high a point as to see in Aigues Mortes the only real and permanent rival of England in the coal trade of the Mediterranean. It certainly is true that, if it is any consolation to a disused port that it once was used, this consolation is not denied to Aigues Mortes. It does not appear to have been much used since the days of ST. LOUIS, which is rather a long time ago; but it was then so much thought of that ST. LOUIS embarked there on his first expedition to Palestine with a fleet of eight hundred galleys, and an army of forty thousand men. Gradually its trade has dwindled away until, as M. LENTHÉRIC confesses, the latest returns show that the commerce of Aigues Mortes has altogether passed from the sublime to the ridiculous. In 1878 the port was only visited by fifty-one vessels, which brought in a few oranges from the Balearic Islands, and took away twenty-four tons of coal. It is the great stride between this humble export and the possibility of a successful competition with Newcastle and Sunderland that imparts a romantic interest to M. LENTHÉRIC's speculations. If these speculations were the mere idle dreams of a fanciful and ignorant theorist, they would have no interest at all; but M. LENTHÉRIC approaches his subject with exhaustive learning, with minute topographical knowledge, and with extreme technical plausibility. He almost makes us believe that even Aigues Mortes is not so dead but that it may live again. Whether he is really right no one at a distance can pretend to say. Whether, if he is right, he can persuade M. DE FREYCINET to share his enthusiasm and carry out his projects, must remain doubtful; but at any rate he has had the merit of unfolding a project which may be taken as a typical instance of the ardent activity which now animates provincial France.

There are two ways in which M. LENTHÉRIC thinks greatness may be given to Aigues Mortes. It may be made the key of a great channel of communication between the Rhône and the sea, and it may be made the outlet for the rapidly increasing products of the coal-fields which lie not far from it in the department of the Gard. M. LENTHÉRIC spends much labour in explaining, not only how useless the Rhône becomes as a means of navigation when it nears the sea, but also why this must be so on account of the unfortunate configuration of the soil. It is useless to follow him into details, as every one who has passed, however rapidly, through the region of the Lower Rhône knows that, among the freaks of wasteful nature, none is more conspicuous than the disappointing end of a river which for so large a portion of its course serves as a great artery of trade. As the Rhône cannot get to the sea in any useful fashion, man has to take it there. There is already a canal, called the Canal of Beaucaire, leading from a point of the Rhône near Tarascon to Aigues Mortes; and from Aigues Mortes there is a maritime canal to the Mediterranean. What M. LENTHÉRIC wants may be said in a few words to be that this waterway should be so improved that vessels trading on the Rhône shall be able to come to Aigues Mortes and there discharge their cargoes into sea-going ships. The history of the existing canal is not only curious in itself, but necessarily determines the character of M. LENTHÉRIC's project. From time immemorial salt-works, known as the Salines de Peccais, have been in operation in the immediate neighbourhood of Aigues Mortes, and these salt-works, which even now yield a revenue to the State of nearly half a million sterling, were at one time among the most considerable sources of the royal income. Great, however, as were the sums that were drawn from the salt-works, one king after another found that he was receiving much less than he ought to have received. The contraband dealers in salt were too much for the officials, the guards, and even the troops of the sovereign. They hid where no one could find them in the marshes and lagoons that spread on every side, and it was thought that the only effectual means of beating the smugglers would be to construct a canal along which all the salt produced must pass. The canal was intended not to benefit Aigues Mortes, but to protect the royal revenue; and, although schemes for improving the land adjacent to the canal were always associated with the main project of the canal itself, the primary object of getting the royal salt to the Rhône impressed its peculiar character on the enterprise. The kings, however, never thought of making the canal themselves. What they wanted was to persuade others to make it for them, the privilege of exacting very high tolls being held out as a temptation to speculators. Under this system the canal took more than a hundred years to construct. The first person who engaged in the enterprise was the Marquis DE NOAILLES, who in 1702 received a concession authorizing him to construct a canal and drain the country between Beaucaire and Aigues Mortes. Unexpected difficulties, however, prevented even a beginning being made. The district was agitated by the religious wars of the Cevennes, the local proprietors set up claims equally innumerable and embarrassing, and sufficient engineering ability could not be commanded for the practical execution of the task. The concession passed by inheritance or substitution from one set of persons to another, none of whom could make anything of it, and in 1746 it was handed over to the States of Languedoc. The local authorities took thirty years to study how they might best begin the work, and in 1778 they did make a beginning, and the enterprise was prosecuted with some activity till the revolution put a stop to it. In 1801 the concession given in 1702 was renewed in favour of a Company which is still in existence, and is the present owner of the canal. Its existence, according to its original grant, would have expired next year, but the term was prolonged for a further period of fifty-eight years by LOUIS NAPOLEON when President. The canal was completed in 1811, so that for nearly seventy years it has been in use; but at present it is not the kind of canal which can contribute to the resurrection of Aigues Mortes. It is only suited for little salt-boats, and the Company is entitled to charge tolls so high as to make a higher style of navigation impossible. What M. LENTHÉRIC proposes is that the State should buy up the Company's rights of tollage, and should then widen and deepen the canal so as to admit the passage of the ordinary boats that trade on the Rhône.

This junction of the Rhône and the Mediterranean by means of a canal, on which only such duties would be charged as might be necessary to keep the canal in repair, would, as M. LENTHÉRIC observes, not only revive Aigues Mortes, but, by establishing a salutary competition, reduce the cost of railway transport. But the canal is, after all, in the visions of M. LENTHÉRIC, a means of doing good altogether secondary to that of making Aigues Mortes the outlet for the coal of the Gard. France, as a whole, produces much less coal than she consumes; but in the case of the Gard the output largely exceeds the local demand, and the only obstacle to the increase of the output appears to consist in the difficulty of getting away what is produced. As it is, the output, which in 1850 was under three hundred thousand tons, rose in 1860 to a million, and may be now taken at two million tons. It is easy for M. LENTHÉRIC, or any one else with a map in his hands, to see that Aigues Mortes, if it was a port at all, would be

much the nearest port to the coal-field, and ought to compete successfully with the rival ports of Cette and Marseilles. It is also obvious that all that M. LENTHÉRIC urges as to the utility to France of having an export trade in coal is perfectly true. English coaling-vessels, having an outward freight assured, can carry homeward freight at lower rates than will remunerate French owners whose vessels go out empty. For all points of the Mediterranean, French vessels starting from Aigues Mortes would have the advantage of proximity; and M. LENTHÉRIC in his dreams sees a vision of French ships carrying coal to Alexandria, Beyrout, Constantinople, and Odessa, and bringing back Egyptian cotton, Syrian wool, Turkish oil, and Crimean wheat. It may be asked how it happens that even now these great things cannot be done. Cette and Marseilles are not quite so near as Aigues Mortes to the coal-field, but they would seem near enough to give the exporter a fair chance of outstripping the rivalry of English ports. The answer of M. LENTHÉRIC is that neither at Cette nor Marseilles is there any room for a properly conducted coal business. The limited space which those ports command is already needed for other operations, and there is no room for the various and complicated contrivances by which modern ingenuity puts coals on board at a minimum of risk and cost. In this respect Aigues Mortes offers the enormous advantage of being virgin soil. In a city of the dead there are no living interests to injure; and, as M. LENTHÉRIC triumphantly observes, at Aigues Mortes you may cut and carve as you like and you cannot possibly injure any one. But then can Aigues Mortes be made a port? M. LENTHÉRIC replies that, although in one sense it is not a port now, yet in another sense it is not only a port, but a very good one. There is no proper communication between Aigues Mortes and the sea; but the sea part of the port of Aigues Mortes is, according to M. LENTHÉRIC, everything that he or a coal-owner could wish. It is safe, it is sheltered, it is accessible. What stands between Aigues Mortes and its great destinies is simply the trumpery character of the maritime canal. If this canal was but made such as Aigues Mortes has a right to expect, the freighter could at any moment send his coal to Beyrout or Odessa with the utmost expedition, and bring back his oil and wool with comfort and safety. If M. LENTHÉRIC is thought mad by steadygoing people, it must at least be owned that there is much method in his madness. We do not suppose that any Newcastle coal-owner or freighter will be much perturbed by the projects of M. LENTHÉRIC; but if for any reason he wishes to know what is really going on in France, he may find it not unprofitable to take note of a fresh indication that French energy is beginning to assert itself in a degree hitherto unknown.

THE NEW EDUCATION REPORT.

THE Report of the Committee of Council on Education for the year 1879 is a more than usually interesting paper. It discloses a policy, and those interested in these matters will be curious to know how far this policy will be persevered in by the new Committee. Will Lord SPENCER and Mr. MUNDELLA adopt or rescind the changes already made, and the further changes indicated by the Duke of RICHMOND and GORDON and by Lord GEORGE HAMILTON? In our judgment, they will do well to adopt them. It is not necessary in saying this to give any opinion on the extent or nature of the aid that it is expedient to give to public education, whether out of the taxes or out of the rates. That is a very proper subject for discussion both in and out of Parliament. All that need be maintained at present is that, whatever be the amount of aid given, it should be given *eo nomine*, with full knowledge of the purpose for which it is given, and in the form which is best calculated to answer that purpose. It can hardly be contended that any one of those conditions is at present fulfilled.

When the Act of 1870 was passed it is safe to say that no one supposed that the system it founded was anything else than a system of elementary education—a system which, in the words of the new Report, "was meant to "be settled solely with a view to the wants of the labour-"ing and other poorer classes of the community;" and consequently to be regulated by the age up to which the children of these classes can remain at school. The age at which the compulsory machinery created by the Act ceases to be applicable is thirteen, and, though nothing is said in it about the age at which it is contemplated that elementary education should come to an end, it is only reasonable to suppose that it was meant to be the age after which a parent can no longer be required by law to keep his child at school. In so far, therefore, as children remain at school after that age, and in so far as provision is made for giving them instruction which can only profitably be given them after that age, the intentions of the framers of the Act have presumably been exceeded. They may, no doubt, have been improved upon; that is a point on which we express no opinion. It is competent to Parliament to create a system under which secondary, or even the higher, education, should be brought within the reach of all classes. All that is now maintained is, that Parliament did not mean to create, or make any approach towards creating, such a system in 1870 or in 1876, which are the years in which the laws which regulate national education were passed; and that it is not expedient to introduce such a system piecemeal and by a succession of side winds. It will hardly be denied that the motives which would induce Parliament to give secondary education, if not free of cost, at least at a cost very much below the actual outlay incurred, would be altogether different from the motives which have induced it to give elementary education on those terms. The theory which lay at the root of the Act of 1870 was twofold—first, that the community is exposed to actual danger by the gross ignorance of its poorer members; and next, that, as a child suffers throughout life by being left in gross ignorance, it is as much the business of the State to see that he gets necessary education as to see that he gets necessary food. Neither of these positions can be appealed to in support of a proposal for bringing secondary education within everybody's reach. The community is not endangered by the fact that many of its members are acquainted with only one language, and have but an imperfect grammatical knowledge even of that; nor are the prospects of a child in life necessarily and visibly benefited by his being given an education which he will have no opportunities of applying or keeping up when he has left school. State aid to secondary education may be in the highest degree expedient; but it must be for quite other reasons than those which make it expedient to give State aid to elementary education. This being so, it is plainly desirable that Parliament should not be led on into aiding the one, in the belief that it is aiding the other. Even if it could be shown that the gain to the community from a system of State-aided secondary education would be so great that it is desirable to introduce it by any means that offer themselves, this would not be an argument in favour of mixing it up with elementary education. The two kinds of education are so different that they cannot profitably be given by the same teachers or in the same schools. For practical purposes they may be taken to be mutually hostile. The teacher who is competent to give secondary instruction, and has scholars to whom to give it, will almost inevitably come to despise the less interesting part of his work. The task of training the young idea is at all events more delightful in its later stages than in its earlier. In a quotation from the Report of the Schools Inquiry Commission, given in the Report of the Education Department, it is truly said that, "If a boy "is to leave school at fourteen, it is not the best thing for "him to have a fraction of the education which would "suit boys who could stay at school till eighteen." If, therefore, boys of all ages up to eighteen are allowed to remain at an elementary school, some of them must be receiving an education which is not the best thing for them to have.

These considerations cover more ground than is included in the scope of the new Education Report. It is by reference to them, however, that the meaning of the alteration in the Code with regard to the age at which children cease to be chargeable to the Parliamentary grant will be best seen. The department is, or was, of opinion that, though it is expedient to give those children who can afford to remain at school till thirteen the best education that can be given within that limit, it is not the business of the department to do more than this. "By the age of thirteen, if pro-"perly taught, children can pass through the six standards "of the Code, and the three stages of one or more of the "specific subjects of the fourth schedule." When this is

done the function of the State in regard to them, as at present understood, comes to an end. If they wish to carry their education further, they must go to some secondary school. It appears, however, that "the "presence in Board schools of children of a superior "class, who are able to remain longer at school than "was contemplated by the Act of 1870, has led some "School Boards to entertain educational proposals of a "more ambitious character than is recognized by the "Code, which in some cases have led to a practical "conflict between the scheme of a School Board and "one settled for a secondary school in the same town "by the Endowed School Commissioners." Until now this state of things has been rendered possible by eighteen being inserted in the Code as the age beyond which children shall be no longer chargeable to the Parliamentary grant. The Education Department believe that this limit was chosen to meet cases in which the elementary education of children had been entirely neglected owing to the want of proper schools. Now that the Education Act has been in force for nearly ten years this plea can no longer be urged, and the Department have, therefore, fixed fourteen as the limit after which children will cease to be chargeable to the Parliamentary grant. The change is one that needs no defence. If the Legislature wishes to pay for the education of children up to the age of eighteen, it has a perfect right to do so; but it ought not to be led on into paying for it until it has been given an opportunity for fully reviewing the whole question, and the important principle involved in it.

There is another point touched upon in this Report which, though it is less directly connected with the administration of the Education Department, is a matter of some moment to the ratepayers of London. Every child in average attendance in a London Board school costs the ratepayers 31s. a year. Every child in average attendance in a Sheffield Board school costs the ratepayers 8s. 8d. a year. Every child in average attendance in a Hull Board sc ool costs the ratepayers 4s. 4d. a year. There may be very good reasons for this enormous discrepancy; but, if so, those reasons ought to be stated and investigated. The rate which in London educates one child will educate nearly four children in Sheffield and nearly eight children in Hull. If the education given in these two latter towns is inferior to that given in London, it would be interesting to know whether the Hull and Sheffield educations are not good enough, or the London education is too good. If an education in London costs nearly eight times as much as the same education in Hull, and nearly four times as much as the same education in Sheffield, it would be interesting to know whether the difference is due to avoidable or unavoidable causes.

THE PROPHECY OF ST. MALACHY.

UNDER the title of *Corona Catholica*, and in a gorgeous binding of scarlet and gold, Mr. Charles Kent has "offered at the feet of the Successor of Peter" an epigram in fifty languages, ancient and modern, and from as many different hands, on his accession to the pontifical throne, which he considers a suitable method of testifying reverence for the eminent virtues and learning of the "Ruler of the world." The original English stanza, which we subjoin for the benefit of our readers, is neat, if not particularly striking. The Latin version is so involved as to be rather difficult to construe; the Greek, by Professor Paley, as might be expected, is pure and classical. On the greater number of translations we cannot undertake to pronounce any critical judgment, but such names as those of Professor Sayce, Max Müller, and Renouf may be accepted as vouchers for the correctness of the Assyrian, Sanskrit, and Egyptian. The English original runs as follows:—

> Through the Cross on Cross of Pius,
> As through Mary's Dolours Seven,
> Lo! from Death what Life emerges,
> Joy from anguish, Light from Heaven.

It will at once be observed by connoisseurs that the two mottoes of the late and present Pope respectively in St. Malachy's Prophecy—*Crux de Cruce* and *Lumen de Cœlo*—are worked into this epigram, and indeed the actual words occur in the Latin form. And we should gather from Mr. Kent's preface, which is headed "S. Malachy, Archbishop of Armagh," that his main object is to rehabilitate that curious document, which he evidently believes to be genuine. We are reminded how St. Malachy flourished in the first half of the twelfth century, and was an intimate friend of the great St. Bernard, who wrote a Life of him — which is hardly perhaps considered generally "to be one of his most finished masterpieces." But St. Bernard, while crediting his friend with miraculous and prophetic gifts, says nothing at all of this "most renowned of all the visions and prophecies attributed to him," which was in fact never heard of, as Mr. Kent candidly admits, till four centuries and a half after his death. It is true no doubt, though it scarcely seems a sufficient explanation of this long silence, that the art of printing was not invented till the latter half of the fifteenth century; but a good century more had to elapse before the first publication of the Prophecy of St. Malachy by a learned French Benedictine, Arnold Wion, in 1595. Under these circumstances Mr. Kent prudently declines to "insist upon its authenticity," but he thinks it bears a certain analogy to "that mysterious Fourth Eclogue of Virgil," in which the Advent of our Lord and His birth of a Virgin were predicted forty years before the event, and to the Sibylline acrostics. So do we, but on that point we shall have a word to say presently. Several fresh editions appeared during the seventeenth century, and in 1675 one in two splendid quartos was dedicated by permission to the reigning Pope, Clement X., and "formally authenticated by the notable words, *con licenza dei superiori*." To Mr. Kent's mind this dedication seems to be conclusive, though he does not exactly say so. A certain Jesuit Father Menestrier did indeed in 1689 venture to express the first doubt as to the authenticity of the document, and in 1859 the Rev. John O'Hanlon published a *Life of Saint Malachy*, in which he reiterated that doubt. But their scepticism is rendered innocuous, if not excusable, by the consideration that Father Menestrier either ignored or— let us charitably hope—was ignorant of the fact that Pope Clement X. had scarcely two decades before deigned to accept, as Pontiff, the dedication of those "two splendid quartos, in which the authenticity of the predictions was formally maintained," while Father O'Hanlon frankly acknowledges his regret at having been unable to obtain a sight of "that most remarkable publication." It seems clear however that the condescending approval of Clement X. did not go for much with Father O'Hanlon, whatever he might have thought of the arguments. Finally Mr. Kent urges that these Prophecies "present from first to last a series of astounding coincidences," of which he thinks, however, it will suffice to mention four. Three of these four, we may observe, are invariably selected whenever it is desired to illustrate the striking coincidences in St. Malachy's Prophecy, from which it is only natural to infer that they are somewhat exceptional, even if the exceptions cannot be said to prove an opposite rule. These four are the mottoes of Pius VI., *Peregrinus Apostolicus*; of Pius VII., *Aquila Rapax*; of Pius IX., *Crux de Cruce*; and of Leo XIII., *Lumen de Cœlo*. We may add that the fourth Pope after his present Holiness is to be *Papa Angelicus*, and this is a personage who had figured in earlier vaticinations, being first mentioned by Roger Bacon.

The fact is that St. Malachy's Prophecy, whatever may be the exact date of its composition—and there is no shred of evidence for its existence before the time of its first publication in 1595 —belongs to a vast family of visions and predictions running through the whole course of Church history. Some ten years ago Dr. Döllinger published a little work on the subject, which was noticed at the time in our columns, giving copious examples from the beginning of the Christian era to the period of the Reformation. And we took occasion in a subsequent article (April 20, 1872) to call attention to various later illustrations, coming down to our own day, of this ineradicable human instinct for prying curiously into the future. It is not of course at all confined to the Christian era; thus a special gift of prophecy was attributed to virgins, both among the ancient Greeks and Romans, and in India, as Clement of Alexandria testifies. In referring to the Sibylline oracles Mr. Kent recalls the earliest, most long-lived, and most famous of all those Christian prophecies, but with more than questionable discretion for his own purpose of helping to authenticate St. Malachy. It is very possible that the first of the fourteen Sibylline Books formerly in circulation, eight of which we now possess, may have suggested the strangely Messianic colouring of the Fourth Eclogue of Virgil. But what is the origin of the Sibylline books, so far as it has been as yet clearly ascertained? The earliest of them was probably composed by an Alexandrian Jew at the beginning of the second century B.C.; it closes with predictions of the future coming of the Messiah, borrowed from Old Testament prophecies, and may have become known to Virgil. The second and third books also betray their Jewish authorship, but must have been composed after the destruction of the Temple of Jerusalem, somewhere about the end of the first century of our era. The next five books are evidently of Christian composition, and are assigned by most critics to the third century. That fragments of the old Pagan oracles are embedded in them is more than probable, but they can only be regarded on the whole as deliberate impostures. The acrostic on the titles of our Lord, to which Mr. Kent refers, as well as another on the Cross, quoted by St. Augustine, occur in the eighth book. The acrostic form seems to have been adopted because it was a known characteristic of the original Sibylline verses. For some sixteen centuries these pretended oracles were accepted as genuine throughout Christendom without a shadow of a misgiving. They were habitually cited from the first in controversy with Pagans by the most eminent Christian Apologists and Fathers, such as Tatian, Athenagoras, Justin Martyr, Clement of Alexandria, Lactantius, and the great Augustine himself. Justin Martyr ascribed the Pagan prohibition to read them, under pain of death, to the express instigation of the devil. Clement of Alexandria has preserved the tradition that St. Paul advised Christians to study them. The

Emperor Constantine quoted them in a solemn oration before the Council of Nice, and both he and Lactantius reproach the Pagans—not unjustly perhaps—with dishonesty in seeking to discredit testimonies so cogent against themselves. The adoption of the fish as a sacred symbol was derived from the acrostic already mentioned, and the opening stanza of one of the grandest of the old Latin hymns almost ranks the Sibylline oracles with the inspired prophecies of the Psalter in the famous line *Teste David cum Sibylla*, still retained in the Roman missal, though altered in some later versions into *Crucis expandens vexilla*. The first eight books were collected and published at Basle by Vossius in 1545, and Castellio about the same time pointed out that they contained many passages which must be spurious. In the next century a Jesuit, Possevin, observed that there were many passages purporting to be written before the time of Moses, which must therefore have been interpolated, as the Sibyls were known to have flourished at a later date; but he attributed these interpolations to the malice of Satan, who desired thereby to discredit the rest of the work. At last in 1649 a French Protestant preacher, Blondel by name, ventured, for the first time among Christians, to denounce the entire compilation as a tissue of clumsy and deliberate forgeries. And later criticism has established the substantial correctness of his view. It does not of course at all follow, nor is there any reason for supposing, that the early Christian fathers and controversialists did not appeal to them in good faith. It was an uncritical age, and the Sibylline forgeries formed part of a whole literature of the same ambiguous kind, portions of which still remain to us in the apocryphal adjuncts to both Old and New Testament—*e.g.* the *Preaching of Noah*, the *Book of Enoch*, the *Epistle of Barnabas*, the Apocryphal Gospels, the *Clementine Recognitions*, and the like, all equally spurious, though not always of fraudulent origin.

Nor has the fount of prophecy, as was observed before, by any means run dry in the middle ages or even down to our own day, and these popular predictions often deal with secular as well as religious and ecclesiastical matters. There is, for instance, a whole series of them connected with English history, ascribed to the mythical Merlin, which Galfridus has put on record; and hence old English chroniclers often use such phrases as "*ut impleretur Merlini prophetia*," or "*tunc impletum est illud Merlini*." It is not to be wondered at that some of these predictions—like those of St. Bridget and St. Hildegarde, which pointed to the Reformation—should have been remarkably fulfilled. St. Bridget even predicted, as modern Italians are not slow to remember, that the Papal sovereignty would be confined to the Leonine city. We have no doubt that there are many in the present day besides Mr. Kent—and not exclusively Roman Catholics—who attach a more or less definite credence to this Prophecy of St. Malachy, and whose belief would not be disturbed were it conclusively proved to have originated with those who first published it to the world, at the close of the sixteenth century. They would argue, plausibly enough, that if the Papal mottoes of the first four centuries and a half were mere ingenious historical applications—many of them indeed, as Mr. Hemans has pointed out, hardly rising above the dignity of puns in their obvious derivation from the family names, names of birthplaces, or heraldic devices of pontiffs—it does not follow that the rest have no predictive value. And they would point triumphantly to such startling congruities as those to which Mr. Kent refers in the description of some recent popes. But the circumstance that for modern readers this prophetic catalogue carries with it, by necessary implication, an announcement of the approaching end of the world would alone give it a peculiar, if somewhat unpleasant interest to many minds; and believers in Dr. Cumming at all events cannot blame them. Leo XIII. is to have only nine successors, whose character or destiny is thus mysteriously adumbrated:—*Ignis ardens*, *Religio depopulata*, *Fides intrepida*, *Pastor Angelicus*, *Pastor et Nauta*, *Flos florum*, *De medietate lunæ*, *De labore solis*, *Gloria olivæ*. Then comes the end. "In the last persecution of the holy Roman Church the chair shall be filled by Peter, a Roman (or the Roman Peter), who shall feed the flock amidst many tribulations, which being accomplished, the Seven-hilled City shall be destroyed, and the tremendous Judge shall judge the people." As the average reign of a Pope lasts seven years only, this method of reckoning would fix the final persecution of the Church and the consummation of all things somewhere about the middle of the next century. And that, we suspect, is the true explanation of this sudden revival, after two centuries of oblivion, of a critical and devotional interest in the so-called Prophecy of St. Malachy, which is no doubt strengthened by the curious felicity of the designations severally assigned to the late and present Pope.

"JOCKING WI' DEEFICULTY."

A STORY is told of a Scotch newspaper editor which is almost pathetic in its wide application to professional Merrymen. This editor was also the proprietor of a very well known Scotch journal, and he was thus doubly interested in the success of his venture. But he knew that there was one defect in the print, a fatal defect in a Scottish newspaper. The *Bawbee* was too solemn, too earnest, not sufficiently skittish to suit a gay, unthinking people. The worthy editor looked round him, and at last discovered what he wanted in the person of a funny sub-editor. He then boasted himself in the society of his friends, saying, "I have found in my new sub-editor a young man just overflowing in natural wit and humour. Jocks just pour freely from his lips. Now this is a grand thing for the paper, because, for my part, I confess that I *jock wi' deeficulty*."

Can there be a nobler and sadder picture than that of this good man struggling with an impossible duty? A conscientious, elderly Scotchman, determined to do his level best, sits down to be witty, and finds that he "jokes with difficulty." "He did but give us of his best," and he knew that his best was execrable. Yet his fate was no uncommon one. There are hundreds of men in this great, careless city who go to bed every night with the consciousness that they must "jock" to-morrow, and with the certainty that the process will be laborious, the results depressing. Wit should be spontaneous, the creature of the moment, of the occasion, the beaded bubble winking at the brim of friendly intercourse. "Let your chaff, my dear boys, be like the lambent summer lightning, which glitters and harms not." So said an excellent Headmaster long ago, in a sermon delivered to the boys of Rugby, or Radley, who were under his care. The advice was capital, whether the Rugby (or Radley) boys were able to act on it or not; but how can the professional cutter of jokes expect to attain the Headmaster's ideal? Perhaps he is an artist, or a writer on the staff of a periodical that, every weekly round in this battle of life, is bound to "come up smiling." How is the artist to find about two hundred new topics for funny sketches in the course of the year? How few people think of this when they throw down their *Punch* with a sigh and a feeling of abiding melancholy and supreme despair! There was a drawing last week of a fat woman of fashion which suggested thoughts too deep for tears. How hard must "jocking" come to the designer of that gruesome caricature, how rare must humour be, when the legend of that drawing passes for humour! And yet it is in sorrow, not in anger, that the sensible heart contemplates such failures. People who themselves scribble ought never to have a hard word for the "forlorn and shipwrecked brother," for the professional who has set himself to jest, and who has found the difficulty insurmountable. When the spangled acrobat in the ring "misses his tip," and rolls bruised in the sawdust, the harsh public cries "yah!" but the old performers looking on pity rather than condemn. When snoring "drowns the parson's saw," when critics as they stroll home blame the good man's dulness, there are a few who remember that to expect pathos, humour, eloquence twice a week from every curate is to expect more than human nature can supply. Let us pity the comic designer, let us pity even the clerical buffoon, when his eccentricities fail to tickle his jaded patrons in the stalls, or pews, or whatever they are called.

Like the noble patron of Mr. Wenham and Mr. Wagg, the public is inclined to say that "it has heard that joke about the London Tavern before." Indeed the poor weary jester is very apt to trust to his memory and to the want of that faculty in his audience. There is a humorous paper which is constantly repeating the jokes of yesteryear, jokes much more easily discovered in its back numbers than *les neiges d'antan*. There is another phenomenon which proves that the path of wit, like that of virtue, is steep and hard, and that epigrams are uncommonly scarce in the modern market. The same poor jest will appear on three successive days in the week in three different journals. We have this week observed—and the experience is not rare—the faint dawning of a jape in a halfpenny evening sheet; let us call it (sham names are the readiest resource of him who jokes with difficulty) the *Hesperus*. It would be brutal to say that the readers of the *Hesperus* do not move in "the highest circles." Not many months ago a butcher was furiously assaulted by a lady for declaring that he "only dealt with the aristocracy," and implying that therefore he did not deal with her. No doubt the halfpenny public is "aristocratic" enough for its needs, and would be enraged by any one who doubted its quality. But perhaps that public is not very likely to purchase the more expensive "society" papers, and there to find (as it would find this week) the same cheap old joke retailed at a much higher price, in one of the usual columns of ungrammatical gossip. Probably there is plenty of life yet in the witticism (it was a hit at Lord Beaconsfield), and we may expect to see it adorning the columns of many another contemporary.

The "moral tone" of the perplexed jester is apt to be "lowered some," as the American says in a story so old that we daily expect to see it revived as a new piece of gossip, with new names, characters, and costumes. Even in Charles Lamb's time, when jokes were paid for at the cheap rate of sixpence each, the purveyors of humour were apt to grow indolent, and to supply very indifferent wares. Even the least educated jackal of the press remembers the unscrupulous efforts to make sixpence out of the name of Mr. Deputy Humphreys. Stupid and blundering personal attacks now take the place of remarks about Mr. Humphreys. He who "jokes with difficulty" often lies, slanders, and generally speaking discharges his sixpence worth of spite with some facility. Now this practice must be ruinous to the character of the purveyor of jests. Having no jests to dispose of, he shies a paragraph, as the man in Aristophanes's comedy hurls an unholy missile, at any one whom he happens to hate. It is a ready-money business, and the professional does not dislike it, but his moral character suffers. He who was once among his brother reporters and penny-a-liners the gayest pothouse wit, is now a snarling, scandalous paragraph-monger. The difficulty of jesting has been his bane.

Before a jester sinks to the level of the mere social tout, he has to go through a series of degrading dodges. A writer may start

in life with a fair supply of high intellectual spirits, but our modern literature has only one performer of this sort who keeps his high spirits perennially, and can neither speak nor write without dropping guileless good things. His high spirits are among the first qualities that the professional jester loses. He is obliged to economise his fun for the purposes of business. He is tempted, like an amiable politician, to keep a note-book, and jot down his own happy thoughts, which he once scattered with careless profusion, "as rich men give that care not for their gifts." He finds that he must keep his high spirits for his articles, as the post-boy reserved his canter for the avenue. The jester when his jesting cap and bells are not on becomes a moody man, and, so to speak, "ranges apart." He has been known—such is the depravity which his profession develops—to keep common-place books with hints for allusions and funny "tips." Then he falls into his anecdotage, and becomes careless about repeating his humorous illustrations. At first he tries to be indifferent honest, and not to tell the same story twice in the same newspaper. But presently he becomes careless even of this rule, and the readers of the journals in which he patiently and laboriously jokes know quite well when to expect the anecdote about the American who swore fearfully, or the legend of the Irishman who was "agin the Government," or the passage from Mr. Tennyson which admits of two constructions and favours the designs of the punster. Mr. J. S. Mill, having little apparently to trouble him, once fell into a deep melancholy at the thought that the combinations of musical sounds might be exhausted. "The sooner the better," some people will say; but the professional jester has a more serious grievance. He finds out very soon that all his own comic illustrations might be exhausted, and where is he to glean new material? Unless he keeps a tame American and a domesticated Irishman on the premises, how is he to secure fresh anecdotes? He never read much, and, since he took to joking in the papers, he does not read at all. He is a worn-out, miserable, exhausted being, and, if he is not very careful, may sink to representing "Literature" at the banquet of a Lord Mayor who patronizes the press, or at the ghastly festivities of the Royal Society of Literature.

There are, of course, certain mechanical dodges by which joking is made quite easy to the performer, as easy as grinding a barrel-organ. For example, he hunts out a story of a ghastly murder, or of some hideous cruelties committed in Texas, or at Smyrna or Volo, and he tells the story with ironical mirth. He speaks of the murderer with affected sympathy, and gently deplores the result of ungoverned passion. To joke this kind of joke, supplies of not less than six dead bodies, and a larger proportion of broken hearts, are all that is necessary. Missionaries, again, are the natural game of the professional joker, and, when he is allowed, he can make a good deal out of any exhibition of unsophisticated religious feeling. He welcomes any account of a burglary, for joking about burglaries is almost always easy; and, in short, wherever a paradox can be introduced, the jester jests with ease. Any one can invert, in fancy, the ordinary opinions of men, and it can scarcely happen but that the result will be a little grotesque. Thus the character of the Merryman is likely to be sapped, and he really ought to be very miserable. But he ends like the Frenchman in M. Richepin's story. This Frenchman was a literary person who had committed two murders. He made a reputation by writing a brilliant novel founded on his misdeeds. Remorse overcame him, he confessed his crime, confessed that his fiction was history, and was shut up by an incredulous world in a mad-house. There he really went mad, and believed that he had not committed his crimes. Even so the professional joker has a stage of contrite misery when he recognizes the badness, the laboriousness of his jokes, and he ends in a callous condition in which he no longer knows that his jests are forced and feeble.

THE LITTLE TROUBLES OF THE MINISTRY.

THE man who, by means proper or improper, acquires somebody else's shoes and puts them on his own feet subjects himself thereby to some discomfort—a proposition sententious, but perhaps not the less true. Her Majesty's Ministers have apparently determined to step into their predecessors' shoes in an unusually full and exact sense, and it is therefore not surprising that certain little pinches and twinges should have occurred. Indeed, if rumour is to be credited, some of the pinchings have been of an extremely severe character—all humanity, at least all humanity that wears boots, agreeing that there are few tortures more torturing than that of the boots which are tight. On Monday evening evidences of misfit were not wanting at an early hour. In the higher political comedy of the less humane kind, few scenes have latterly been attempted of a more daring character than that of the Premier's reply to Mr. Ashmead-Bartlett. The question was indeed something of a question-begging one. But when there came from Mr. Gladstone's mouth the words "There is no doubt that much crime and *probably much cruelty* have occurred," memory must surely have carried not a few of the listeners back to the autumn of 1876. Blackheath is but within penny steamboat range of Westminster, and the library of the House of Commons doubtless contains a copy of "Bulgarian Horrors." How suggestive of "the lisp of lute strings smitten soft," to quote the words of a gifted bard, is the phrase, "much crime and probably much cruelty," as compared with all the drum and trumpet work of the former period. "We draw," said Mr. Gladstone, "no distinction between Mahometan and Christian"; yet he certainly seems to keep two languages for the two classes of sufferers. This, however, was but a prelude to the unpleasantness which the Ministry had to undergo in reference to the Bradlaugh matter. That exceedingly thorny question seems somehow to have lodged all its thorns in the persons of the Government and their supporters. They have the mortification to see themselves deserted on the first important division of the new Parliament by some of their supporters, to see a much larger number refuse to vote, and to feel that a considerable proportion, probably a majority, of those who did vote with them felt the obligation to do so as an almost intolerable strain. It was not pleasant to be placed, as Lord Randolph Churchill oratorically placed Mr. Gladstone, in the position of leading the Liberal party for the first time through the lobby for the purpose of seating on the benches of the House "an avowed atheist and a professedly disloyal person." It was awkward to have Dr. Lyons, one of the rare Liberals of Ireland, voting and speaking against the Government. It could scarcely have been comforting even to have the assistance of Mr. Thorold Rogers, and to be assured on that most excellent authority that all atheists were Tories, and that the favourite amusement of Tories was to receive the gold of France. The gold of France is wanted for other purposes just now, and indigent Tory members (by the way, Algernon Sidney was a Tory, was he not?) must look elsewhere for their income. The rule as to Tory atheists had hardly so much actuality as the exception as to the Radical atheist who is troubling the House. To be taken under the wing of Mr. Trevelyan, to have Mr. Courtney "admit" that he was almost persuaded to vote with the Opposition, to be championed by Mr. T. P. O'Connor—all these things must have been gall and wormwood even to a person so well skilled in taking bitter draughts without making wry faces as the present Prime Minister. But all these subsidiary bitternesses must have been as nothing compared with the feeling of the cause which he was actually defending. No one questions the sincerity, the ardent sincerity, of Mr. Gladstone's religious belief. But premiership, like other things, evidently makes men acquainted with the strangest of bedfellows. How grateful Mr. Gladstone must feel to Mr. Adam for his judicious management of the Northampton election!

If, however, Monday night was one of slow martyrdom, Tuesday was distinguished by two acute spasms which must have affected all the Ministry alike. For days they have been the butts of the eager expostulations of their partisans, of the grave and ironical consolations of their opponents, in the matter of Sir Bartle Frere, and to a less degree in the matter of the Transvaal. The retention in his post of the Governor and High Commissioner of the Cape was not an act which could possibly meet with directly hostile criticism at the hands of Conservatives, or of those uncommitted persons who had approved the African policy of the last Ministry. But, if the act escaped censure, the actors were certainly in a most awkward position. Conservative support was, under the circumstances, the most headbreaking of precious balms, and Radical reproach was as hard, if not so intolerable. But surely no Cabinet, after having got itself into a fix, ever got itself out of one in so strange a fashion. Mr. Gladstone's language in reference to his own statements was characterized by his usual casuistical ingenuity; and it is probable that his conscience was quite at ease when he denied that he had said in Midlothian what he had actually said in Peebles. His adversaries are used to this; his followers, we suppose, are used to it likewise. Perhaps they are also used to the tortuous phrases in which the Government intentions with regard to Sir Bartle were finally adjusted in some occult manner to the demands of the Radical members. Confederation is, it seems, of immense importance; and Sir Bartle is of immense importance to confederation. We are inclined to think that the late Government had some similar idea. Places in which the High Commissioner might do mischief have been handed over to Sir George Colley, as "geographically belonging" to that officer. So, we think, similar places were recently placed under Sir Garnet Wolseley—possibly for geographical reasons also. Sir Bartle's "hands" are not to be "weakened," but "precautions have been taken which will be quite effectual against the possible bias of any events in South Africa which might give cause for dissatisfaction." Finally, at some future time, Sir Butle's case is to be "disentangled from the subject of confederation"; in which it is, as we fully admit, at present very considerably entangled—by Mr. Gladstone. It is almost impossible to avoid feeling profound commiseration for a statesman floundering in such a mess as this. Mr. Gladstone wishes to retain Sir Bartle Frere in office; he knows, let us say, that it is wise to do so; he knows that by so doing he is making his followers indignant and his enemies scornful. So he "jumbles it all together," as Captain O'Brien did when he was beaten by one French ship and took another. He means to keep Sir Bartle in office and he means to recall him; to strengthen his hands and to take precautions against the bias of events; to run with the hare of statesmanship and hunt with the hounds of Radicalism. And all this time there sat, or might figuratively be said to sit, beside and behind him colleagues who delivered all this as their act and deed, and who had over and over again execrated Sir Bartle Frere, denounced the annexation of the Transvaal, and urged the African policy of the Tory Government as one of the chiefest reasons for their overthrow. It was again an excellent comedy, not, however, without something of the tragic in it.

The second paroxysm of Ministerial humiliation on Tuesday was fortunately of a less grave character. We must confess to a suspicion which has constantly haunted us since the constitution of the Cabinet, that Lord Hartington must have taken a solemn oath not to take the Secretaryship at War. All the world remembers the famous history of the Army Discipline Bill; how it was at first supported with more or less loyalty by Lord Hartington and Sir William Harcourt, the latter of whom indeed had good reason for its support; how the Home Rulers and the English Radicals got up the "cat" agitation; how the present President of the Board of Trade solemnly denounced the present Indian Secretary as the "late leader of the Opposition"; and how, appalled by this, Lord Hartington struck his colours and ran up the black flag. At that time everybody who was not concerned to throw mud at the Government pointed out the flagrant injustice of making such a matter a party question, and the dead certainty of administrative and departmental difficulties which such a proceeding would bring about. On Tuesday Mr. Cowen asked the intentions of the Government as to flogging, and Mr. Childers gave him his answer, an answer which we are sure we are not wrong in saying Lord Hartington would personally never have given. It seems that the members of the Government have just awoke to the necessity of inventing "some punishment that can be substituted for flogging." They have even discovered that "the discipline of the army at a grave crisis" may depend on their powers of invention. They cannot possibly do it this Session, and the House must have confidence in them. If Colonel Stanley is not fully avenged, he must indeed be a rancorous person. That all these considerations must have been fully present to the minds of the Opposition last year it is unnecessary to observe. Indeed the incident would be almost spoilt by comment. We must leave the Government to their inquiries, and hope that the strappado or the wooden horse, the thumbscrew or the boots, may not result from their studies of comparative punishment. For a Ministry to cut a sorrier figure than this is, we should have thought impossible, but evidently the infinite variety of self-abasement is not yet staled for them. In a few days the Karolyi Letter, the Fawcett incident, the case of Sir Bartle Frere, and now this flogging business, have exhibited them individually and collectively in the most ridiculous lights—lights which only cease to be ridiculous when they become odious. The end which we venture to prophesy, the end of men's powers of laughing, must be rapidly approaching, and amusement must give way to another feeling. No Englishman, we should suppose, after the first flash of partisan malice is over, can avoid a certain feeling of shame at what is shameless, of contempt for what is contemptible. The era of misrepresentation appears to be in process of being succeeded by an era of awkward plagiarism tempered by more awkward apologies. Heaven only knows to what this will in its turn give place.

THE EMPLOYERS' LIABILITY BILL.

THERE is reason to hope that the long-debated question of the liability of employers for injuries sustained by persons in their service is near its solution. The Bill introduced by Mr. Dodson is framed on the reasonable lines which Mr. Brassey followed in constructing a similar measure last year. There is another Bill before the House of Commons which bears on its back the names of Mr. Macdonald, Mr. Burt, and Mr. Broadhurst. It would be satisfactory, of course, if the Government could have accepted the working-man's view of the controversy. In that case a definitive end would have been put to the agitation by the conclusive expedient of yielding everything that has been or can be asked. Mr. Macdonald simply proposes to abolish the plea of common employment. He would make it no ground of defence to an action for compensation that the injury was incurred by reason of the negligence of a person engaged in a common employment with the person injured. The law in respect to injuries done to fellow-servants would be assimilated to the law in respect of injuries done to strangers. In all cases where the person injured did not materially contribute to the injury done him by his own negligence, he would have the same remedy against his master as though he were not in his service. But, however desirable it may be to bring the controversy to a final end, it is not permissible to do so by the infliction of positive injustice. The position of a large employer of labour, supposing that Mr. Macdonald's Bill were to pass, would be intolerable. At any moment he might become liable to support a crippled workman for life, or to stand in his place to his widow and children. No amount of care on his part would enable him to avoid this liability. He might employ thousands of workmen, and by the act of any one of them—taken on, perhaps, only yesterday by a foreman, and destined to be discharged as unsuitable to-morrow—he might have this burden laid upon him. There is nothing in an arrangement of this kind to increase in the slightest degree the workman's immunity from hurt. The only immunity that would be secured by such legislation would be the master's immunity from profit. The object of making a man responsible for the acts of his servant is partly to ensure care in the choice of a servant, and partly to make the servant himself careful. It is an additional reason for not keeping a drunken coachman in your service that you may have to pay not only for damage done to your carriage or horses, but for damage done to the persons he drives over. The knowledge that, if his master has to make compensation for some injury done by his carelessness, he will lose his place and not get a character, may in turn help to keep the coachman sober. But where a large body of workmen are concerned there is no room for these motives to act. The master does not choose the men. That is a duty devolving on some subordinate, and even with him it is often a matter of necessity, not of choice. He takes the men who offer themselves, and if he refused them he would get no others. The workman is under no fear of being dismissed; for, if work is slack, dismissal must come anyhow, and so long as it is brisk he is sure of getting employment in one place if he loses it in another. The only reason therefore that can be assigned for making employers liable for injuries sustained by one workman through the carelessness of another is that the employer is better able to stand the loss than the workman is. That is to say, the burden of an accidental injury should fall, not on the man who sustains the injury, but on a neighbour who happens to be rich. If this doctrine were recognized in the case of employer and workman, there seems to be no reason why it should stop there. Let it be supposed that a man falls off a ladder opposite the Duke of Westminster's house, and that the ladder has been carelessly placed by a fellow-workman; why should the duty of supporting the sufferer and his family during his illness or of compensating his family for his death fall to the share of his employer? He is in no way responsible for what has happened, since he could not by any possible care on his part have prevented it. Consequently the only reason for calling upon him to make compensation is the fact that he is able to make it—that is, that he is rich and the workman is poor. But then the Duke of Westminster is probably very much richer than the master, and proportionately better able to pay the money. The principle of Mr. Macdonald's Bill is neither more nor less than the principle of taxing the rich for the benefit of the poor. It is a poor-law designed for the relief of a single class, and charged upon the property of a single class.

Mr. Dodson's Bill steers clear of this error, and limits the liability of an employer for injuries inflicted by the negligence of a fellow-workman to cases in which the person at whose door the injury lies has superintendence entrusted to him, or has authority to give orders to which the sufferer was bound to conform; to cases in which the cause of the injury has been defective machinery or plant connected with the business of the employer; and to cases in which the injury has followed upon obedience to the rules or by-laws of the employer. As regards all the accidents for which provision is here made, the employer clearly has it in his power, if not entirely to prevent, at least greatly to lessen the danger of accident. He can be careful in choosing his foremen, and in seeing that his foremen do not delegate to wrong persons the authority given to them. He can be careful in buying his plant or machinery, and in seeing that it is not allowed to go out of repair. He can take some trouble about the rules in force in his establishment, and insist that they shall be made for use and not merely for show, and be meant to be obeyed, not merely hung up for occasional reference when it happens to be convenient to show that they have not been obeyed. Upon all these points the relation of the employer to such accidents as may happen to his workmen is perfectly intelligible. If he is a good master, he does all these things of his own free will. The accidents that happen to his workmen happen, so far as he is concerned, really by chance; all that he can do to guard against them he does. The object of Mr. Dodson's Employers' Liability Bill is to provide an inducement to careless or parsimonious employers to follow the example of careful and liberal employers. Like most other laws, it is meant as a terror to them that do evil. It is not expedient to punish them directly, but it is expedient to punish them indirectly; to warn them that, if they employ incompetent subordinates or try to save money by using bad plant or bad machinery, they will be held liable for any ill consequences that may follow. The new Bill follows the analogy of many recent Acts of Parliament, and endeavours to ensure good conduct by the unheroic, but effectual, plan of making bad conduct too costly to venture on. It will be a continual reminder to every employer that, where life and limb are dependent on him, he has no business to be negligent. In most cases it is in the power of a master to see that he is represented by capable subordinates; that, in purchasing plant or machinery, he goes to good makers and pays a fair price; and that no rules are laid down in his shop which are not honestly meant to guard against danger, rather than to shield the employer after danger has been incurred. If he is not willing to give his business the amount of time and thought which attention to these points demands, it is only reasonable that he should be made to give it; and Mr. Dodson's Bill will undoubtedly operate as a very strong inducement in this direction. It is identical in substance with Mr. Brassey's Bill of last Session, and in that character it has already received the support of one powerful group of workmen, the Amalgamated Society of Railway Servants. It is creditable to this Society that they should have seen the injustice of Mr. Macdonald's Bill, and have had the good sense to put themselves forward as the advocates of a measure which aims at laying nothing more on the employer than what he may justly be called upon to bear.

THE RETURN OF THE VICTORS.

IF it were not that the political Dissenter is a dreadfully touchy person, and that he is wont to take the most respectful congratulations and the best-meant advice for insult and contumely, we should congratulate the Liberation Society and the Protestant Dissenting Deputies on the feast which at the end of last week they offered to the friends of religious equality in the present Parliament. It is true that we do not exactly know what a Protestant Dissenting Deputy is, but it is evident that he must be something irreconcilably Nonconformist. Now that the Nonconformists, if they did not win the late Radical triumph off their own bat, contributed by far the largest share to it, is indisputable. They seem to be a little uncomfortable in accepting on this point the assurances of those who do not agree with them, but their discomfort is quite needless. No merely political party in England could well have developed the happy powers of casuistry which triumphantly seated Mr. Watkin Williams in Carnarvonshire and Mr. Gladstone in Midlothian, and which have since emboldened the latter to state his opinion publicly on the question of the keeping of promises. We are afraid that, terrible as is the repute of the Church of England among Radicals for electioneering, we could not undertake to find any of its priests or deacons who would be so ready with their absolutions as the Nonconformist ministers of Wales and Scotland. To the victors then—not exactly the spoils, for on that point there is, as we shall see, a little unpleasantness—but the jubilations undoubtedly belong. The Cannon Street Hotel is not altogether a good substitute for the Capitol, and a breakfast is less imposing than a regular triumph. But the Nonconformists have never been remarkable for exact study of the classics or for a burning attachment to art. Even if the services of Herr Makart could have been engaged, there might have been objections on the part of the City police—directed by a base and brutal Tory Corporation—to a solemn march through the streets, with Mr. Richard in toga and crown, and his body painted red, and defeated Conservative ex-members following his car, to be subsequently slaughtered at the City Temple. The allegorical personages, too, who are so important in triumphal processions, would have been difficult to manage. What is the proper allegorical representation of casuistry? Would a group composed of a life-size Welsh voter, urged by earnest Nonconformist ministers not to "reverence the oath," have been sufficient? On the whole, the breakfast was better and safer. As far as symbolism went, nothing could have been more appropriate and gratifying than the spectacle presented within a very few hours afterwards by Sir William Harcourt at Derby. That convertite's presentation to his new constituents appears to have been managed in accordance with a reminiscence of the profane play of *Richard III.* The newspapers represent the Home Secretary as appearing at the balcony of the Midland Hotel supported by Nonconformist ministers exactly as Richard appeared "aloft between two bishops." This was enough for art; the proceedings at the Cannon Street Hotel were refreshingly simple and natural. Breakfast and speeches—food for the body and for the mind, "they belauding, he applauding"—what could Nonconformist wish for more?

The address of Mr. Richard was indeed full of instruction—perhaps we may add, also, of amusement. He informed his audience that he believed there were within the walls of St. Stephen's "more than a hundred Nonconformists proper." This passage at once excites the attentive mind in a pleasing manner. The existence of the Nonconformist proper obviously implies the existence of the Nonconformist improper, and malice instantly desires to find out the denotation of the latter term. Does it apply to Mr. Bradlaugh, of whom it would seem to be a singularly happy description? Does it apply to Mr. Thorold Rogers, who appears to have been present at the breakfast, and whose claim to be a Nonconformist is rather a negative than a positive one? Or does it apply to such weak vessels as Mr. Watkin Williams, who subsequently declared himself to have been "brought up in the Church of England, but to be a Nonconformist in spirit"? The Church is indeed to be congratulated on her nursling, and Nonconformity on its proselyte. But why does Mr. Williams call himself "a Nonconformist *in spirit*"? Does this Carnarvonshire Naaman mean to imply that on Sunday mornings his body is bowing in the steeple-house, while his soul is performing its devotions in Little Bethel? If so, the congratulations just made must be still more hearty. But we left Mr. Richard enumerating Nonconformists. This arithmetical exercise was followed by a lively piece of oratory, describing how the Nonconformist, whom Lord Beaconsfield is said to have said that he had killed, had "stood up armed *cap-à-pie*, and in a menacing attitude." We thought that Nonconformists disliked uniforms of any kind, and a complete suit of offensive and defensive armour seems to be unnecessary for the purpose of getting hold of voters in a corner, and pointing out to them that they will be damned if they keep their promises. But this too may pass, as may also Mr. Richard's quite superfluous demonstration of the efficiency of the Nonconformist tactics. The really interesting part of the speech did not come until he began to deal with the future conduct of the victorious party. His handling was full of matter for the consideration of the Government. The Nonconformists, he said, were not going to be unreasonable, *but*——; they were quite content not to push the question of English disestablishment at this moment, *but*——; they did not grumble at the small representation of Nonconformity in the Government, *but*——. And here Mr. Richard's "but" became such a lively and picturesque "but" that it is necessary to translate it more fully. There are, it seems, about a hundred great and small Government places, "from the Lord Chancellor, at 10,000*l.* a year," says Mr. Richard (with a delightfully ingenuous indication of the real sweets of office) "to the sub-secretary's secretary" at probably 100*l.* Now, as we have already heard, there are also (providentially) just one hundred Nonconformists proper in Parliament. The conclusion is obvious, though we are far from hinting that Mr. Richard presented this ratiocination to his audience. What he did say was that there were only two of all these who were in office, and that those two were in the Cabinet, rather although than because they were Nonconformists. We do not quite see why Lord Ripon and Lord Kenmare, who are Nonconformists too in their way, should not be counted, but this would probably have shocked the Protestant Dissenting Deputies. At any rate Mr. Richard did hint pretty broadly that the labourer was worthy of his hire, and we quite agree with him. No man can be expected to lend the spiritual arm—especially with such vigour and with such an engaging absence of obsolete scruples—for nothing. It is a great disadvantage, says Mr. Richard, to be excluded from place and office as a class. So it is; though, if anybody were to point out that the exclusion is perfectly voluntary and self-imposed, Mr. Richard would probably be angry. He was followed by the Rev. Alexander Hannay, who of all the speakers at the meeting is decidedly the vessel of our choice. There is no nonsense about Mr. Hannay. "He did not," he said, "care for the Burials question one bit, except in so far as it gave them opportunity of getting light into the mind of the nation on the question of religious equality." Cruel, cruel Mr. Hannay! What has become of that great and practical grievance of which we have heard so much? Where are the aggrieved Dissenting relatives waiting, like the fairy in a touching Icelandic story, at the churchyard wall, while a fiendish servant of the State buries their dead with unhallowed and peremptory rites? Evidently nowhere. Mr. Hannay does not care a bit for the Burials Bill except as a lever to work for Disestablishment. After this the speeches got uninteresting, and indeed it must be admitted that there were not many great lights available. The long list of distinguished persons who regretted their inability to be present must have caused woe to Mr. Thorold Rogers, who is never without an historical precedent. "They have more wit than to be here," we can imagine him muttering over his breakfast.

In the intoxication of victory, as in another and more vulgar form of intoxication, there is doubtless truth; and the feasters of Cannon Street, though they probably confined themselves to tea and coffee and lemonade for the most part, told a sufficiently intelligible tale. Mr. Richard's long speech put into a few words means this—"Nonconformity of the political kind is simply a skilful application of religious means to gain purely secular and selfish ends." Mr. Hannay's, treated in the same way, means—"All the grievances we talk of are merely mantlets behind which to work for the undermining of the detested Church." A curious confirmation of this was to be found the other day in a meeting at Bideford, where the amiable Nonconformists of the place rabbled the Bishop of Exeter and Lord Nelson, who had come among them rather dove- than serpent-wise on a message of peace. On that occasion a minister whose name we forget, but who is reported to have spoken with a good deal of vigour, declared frankly that, for his part, he would never be reconciled to the Church as long as he was excluded from the gilt morocco thrones of the Bishops in the House of Lords. People, in short, might talk any nonsense they liked about dogma and church government; what he wanted was place and power. Of course it would have been futile to point out to this outspoken gentleman that, by leaving the national Church, he had put himself out of the running for the gilt morocco thrones, and that the gates of the national Church were open night and day to him if he chose to return. Of course it would be equally vain to point out to him that, if he is excluded from the House of Lords, clergymen of the Church of England are excluded from the House of Commons, where the "Rev." Mr. Brown of Bethel and the "Rev." Mr. Green of Ebenezer may resort at their own sweet will and that of the constituencies to have their hats knocked off by energetic laymen of an oratorical turn. The adage about the goose and the gander is inapplicable, because it is not in the nature of things that the aspiring Nonconformist should allow himself to be compared to a goose. But, though argument of any kind is impossible with the political Dissenter, it does not seem that it ought to be quite so impossible with those who have hitherto been glad to use the political Dissenter as a tool. Mr. Richard hardly exaggerated the stock idea of Liberals on the subject in saying that they think the Nonconformists ought to "lend hoping for nothing again." It is quite obvious that, though the Nonconformists are not such fools as to press for their pay before it is possible to give it them, they are equally determined to have it, sooner or later, in the only form acceptable. Common sense shows this, and their own avowals show it hardly more strongly. These ingenuous avowals also show in what light they regard the sops which Liberal Governments occasionally fling to them. They say, with much honesty, "In themselves we do not care for them a bit; it is only because the granting of them is a step to the granting of what we do care for, the satisfaction of our sectarian spite, the relief of our sense of social inferiority, the glutting of our envy, hatred, and all uncharitableness, that we accept

them at all." Persons brought up in the Church of England, but who are "Nonconformists in spirit," of course cannot be expected to be affected by these considerations. But there must be members of Parliament, and not a few of them, who, if they honestly considered the bargain they are tacitly making and endorsing afresh at each election, would feel some unpleasant qualms.

OUR NEW IRONCLAD.

DURING the present month the trial trip of H.M.S. *Neptune*, which has been at last completed, has taken place in the Solent. This trial was of peculiar interest, to explain which it is necessary to give the history of the latest ironclad added to the British navy. The vessel was, as is generally known, originally called the *Independencia*, and was constructed for the Brazilian Government from designs which Mr. E. J. Reed prepared in 1872. Various mishaps befel her during her construction, but of these it is not necessary to speak. In March 1878, being then, as it was thought, completed and ready for service, she was purchased by the English Government out of the vote of credit, at the cost, deducting what was charged for armament and stores, of 556,050*l*. She was sent to Portsmouth, and during the two years which have elapsed since that time she has, under the direction of the constructors there, been undergoing alterations and improvements which were required in order to enable her to carry the service guns and to take her place as a British man-of-war. In the Estimates for 1879-80 she was described as one of the vessels which were to be completed after purchase, and the task of completing her was estimated at 38,576*l*. Owing to the peculiar manner in which the Estimates were framed this year, it is impossible to ascertain whether this amount has been exceeded; but in any case there can be no doubt that a considerable sum must have been spent on her. Now, at last, she is complete; and as she was designed by, and built under the supervision of, a great naval architect, and was afterwards improved during two years by the Admiralty constructors, it may easily be imagined that much interest attached to her trial trip. What the results of that trip were, and how far they satisfied any expectations which may have been formed, will best be shown by a short analysis of the careful account which has appeared of the vessel's six hours experimental steaming.

Before entering on this, however, it is necessary to give some description of her. The *Neptune* is a very large and powerful turret-ship, inferior in armament to the *Inflexible* only. She carries four 38-ton and two 12½-ton guns, and is protected by armour which is in parts thirteen inches thick. She is of 9,000 tons displacement, and has engines which are supposed to be of 9,000 horse-power. She therefore has, or ought to have, a larger proportion of horse-power to displacement than any other ironclad in the British navy, and her speed of course should be very great. High speed, however, if it were attained, would of course require a great consumption of coal, and in any estimate of the *Neptune's* value to the country as a sea-going vessel of war, her coal-carrying capacity is a most important element; but no information respecting it is given in the elaborate account of the vessel and of her trial trip which appeared in the *Times*. We should mention that this account was published at the beginning of last week; but we have delayed speaking of it till now, as it seemed not improbable that some explanation would be given of the apparent failure which it recorded. None has, however, been offered. With regard to the account it is to be observed that it is clearly the work of a very friendly critic, if indeed the writer can be called a critic at all. He is most anxious that all the difficulties the designer had to contend with should be fully appreciated. He explains that the Brazilian officers who gave Mr. Reed his instructions desired that the ship should have a raised forecastle and poop for the accommodation of the officers and crew, and that these superstructures interfere seriously with all-round fire. He also points out that heavy masts and spars and a large sail area were required, and says pathetically that Mr. Reed "in designing the *Independencia* was greatly hampered by the peremptory nature of his instructions." With what seems extreme anxiety to avoid anything like unfair criticism, he even takes the trouble to explain that the arrangement of the turrets in the *Neptune*, which is similar to that in the *Dreadnought*, *Devastation*, and *Thunderer*, is not so objectionable in the first-named vessel as in the others, since, with any arrangement of the turrets, her forecastle and poop would make end-on fire impossible. It certainly would be very unfair to blame a naval architect for faults which were due to those who instructed him, and it is as pleasant as it is unusual to find a public writer so anxious to demolish all grounds for unjust censure. If, however, such a writer does point out any defects, it may be, to say the least, considered as highly probable that the defects exist, and that they are not in the smallest degree exaggerated by the kindly critic. What he says against the vessel is not likely to be at all beyond the truth. Unfortunately, some defects have to be pointed out in the *Neptune* by this well-disposed writer which, even as stated by him, do not seem to be trifling ones. After stating that she was tried at what is supposed to be "her normal trim," he says that, as she steamed through the water, "her full bows pushed ahead, when driving at full power, a wave which could not have been less than from 10 ft. to 11 ft. in height, and consequently threw great strain upon the machinery as well as retarding considerably the way of the ship. It was also noticed that a broad channel of dead water followed in her wake."

Now those who have not paid attention to naval architecture may not be aware that, as the speed of a vessel increases, so does the wave which she raises in front of her, and that at considerable speed, this wave, and others generated by it, constitute a great element of resistance. Its size depends much on the shape of the ship, and for some time past the principal effort of naval architects in designing vessels intended for high speed has been so to model them that the wave-making resistance might be small. Otherwise enormous power, and consequently a huge expenditure of fuel, are required. It certainly seems as if this object had not been attained in the *Neptune*. It is perfectly true that a considerable bow-wave does not necessarily show that there is a large total wave-resistance; but nevertheless such a wave as that raised by the *Neptune*, and the huge amount of disturbed water she left behind her, seem to show that the wave-making resistance and eddy-making resistance were very great. Full bows—which it appears she has—cause the first kind of resistance to increase enormously as high speed is attained.

From such information, therefore, as has been given respecting the performance of this huge and costly vessel, it would certainly seem as if there were defects in her form which may seriously impair her efficiency as a sea-going man-of-war. To say this is not necessarily to cast grave blame on the designer. He had to deal with a very difficult problem, in treating which mistakes have often been made by accomplished men; and Mr. Reid, though a skilful naval architect, is certainly not infallible. Possibly he may have been even more hampered by conditions than is indicated by the very sympathetic critic in the *Times*. However that may be, the result of his efforts does not seem to be by any means satisfactory, and unfortunately defects in form do not appear to be the only defects of this steamship. Her engines are by those deservedly famous makers, Messrs. Penn and Sons, and, from the first part of the account of them in the *Times* it appears as if they were all that could be desired. They are described as being of Messrs. Penn's well-known trunk pattern, and the writer then goes on to say:—

> In some of our most recent armour-clads, such, for example, as the *Alexandra*, *Téméraire*, *Inflexible*, and *Dreadnought*, and the ships of the Nelson class, the engineer department at the Admiralty has shown a decided preference for vertical compound engines; but the horizontal and simple expansive machinery of the *Neptune* lies well down on the plummer blocks below the water, gives little trouble, wears well, and has afforded great satisfaction in the service. The engines are precisely of the same kind as those which were supplied by the same makers to the *Hercules* and *Sultan*, but of greater power, the augmentation being due to increased boiler power. Indeed, no engines yet afloat have developed the same amount of power under trial; and if the displacement of the ship is considered in connexion with the horse-power of the machinery, the *Neptune* will appear the strongest-engined armour-clad in the Navy. For while the *Dreadnought* is 10,886 tons to 8,000 horses, the *Alexandra* 9,492 tons to 8,615 horses, the *Thunderer* 9,387 tons to 6,270 horses, and the *Inflexible* 11,406 tons to 8,000 horses, in the *Neptune* the power per ton of displacement is equally balanced, being, according to the Navy List, 9,000 indicated horse-power to 9,000 tons.

Certainly it is to be gathered from this that, so far as regards the engines of the *Neptune*, the taxpayers have had good value for their money; but it presently appears from the account of what took place at the trial trip that those all but perfect engines have one trifling fault. The stokehole is not unlikely to stew the stokers alive. After giving a variety of dimensions and some highly technical details, unintelligible to most people, the writer of the account in the *Times* innocently remarks that, when the ship was going to Spithead on the Monday before the trial, the engines "were not pushed beyond forty revolutions. Indeed the temperature in the stokehole, which sometimes reached as high as 163°, proved more than the stokers could withstand." He then explains that, as the turrets are supported on pillars immediately above the stokeholes, the natural air passages are "somewhat boxed in," and that the contrivances which have been resorted to for obtaining a good supply of air proved ineffective. He cheerfully observes that the evil is not beyond a remedy; and for the sake of the unfortunate stokers, who it seems have fires both at their faces and backs, it is to be hoped that he is right; but it is difficult to feel very sanguine when such a defect is discovered in a vessel which has been so long in hand. It probably is not the fault of Messrs. Penn, who, as every one knows, are amongst the best makers in England, but clearly some one must be greatly to blame for the fact that in this long-considered vessel the stokers are liable to be half-grilled and half-stifled at their work. Owing in part, no doubt, to their being threatened with premature cremation, and in part perhaps to other causes, the engines do not seem to have worked well at the trial. The average speed on four runs over the measured mile was 14·216 knots, which is certainly not a high speed for the most powerfully engined ironclad in the navy. Better results, however, are promised shortly. Two years' work at a vessel which was supposed to be complete not having proved sufficient, further improvements are to be made, in consequence of which the engines will develop higher power and, wave-resistance notwithstanding, the vessel will attain higher speed.

At present, however, it must be said that the results which have been obtained are anything but satisfactory, and indeed are such as to cause grave doubts as to the wisdom with which a portion of the money obtained under the vote of credit was expended. This ironclad was purchased for considerably more than half a million, and a large sum has been spent in altering her.

She has the radical defect of not being able to fire or astern, and her trial appears to give reason for supposing that her form is not a good one. Her trial also shows that, when after two years' labour she is supposed to be completed, there is a very grave defect in the arrangement of the boilers and stoke-hole, owing to which the men can hardly work, and the supply of air to the furnaces is insufficient. This defect may possibly be remediable; but the other, if it exists, is not; and it is difficult to avoid the conclusion that the Admiralty were hasty and careless in paying so much money as they did for this very doubtful acquisition to the navy. A staff of experts should have been able to judge of the shape of the hull, and it surely cannot have been very hard to foresee that a large amount of alteration would be necessary in order to fit the vessel for the British navy. The peculiar circumstances under which the money was expended must, no doubt, be taken into consideration; but even when they are allowed for it is difficult to believe that it can have been worth while to give so large a sum for her. It is to be observed, too, that a period of time considerably exceeding the duration of a modern campaign has been required to make the alterations which were thought necessary for her, and that even now she does not attain the intended speed, and that more work is wanted. Probably she will be ready for active service at about the same date that the *Inflexible* is. The time occupied in erecting the Nelson Column seems to be approximated by that required for the building and completion of an ironclad.

THEATRICAL "SUPERS."

THE theatrical super is a person whom the careless playgoer is very apt to regard with indifference. The historical importance of the parts which he is constantly summoned to assume has somehow failed to win for this unfortunate performer the fame which would seem to be his desert. He is at one moment a knight in armour, at another the favourite of a king, and yet the illusion of the stage is powerless to raise him to the dignity of his position. However worthily he may bear a banner or wave a sword, the secret of his identity is still studiously withheld from the public; and if the piece in which he is engaged proves a failure, the force of popular derision not unseldom lights upon his wholly innocent contribution to the dulness of the entertainment. Indeed, where he is not altogether neglected, he is very likely to be treated with ridicule and contempt. His name never finds its way on to any playbill, and his individuality is merged in a motley crowd of "courtiers, officers of the guard, and attendants." If his armour is not a perfect fit, there is always some wag in the gallery ready to announce the fact to the audience; if his sword, as will sometimes happen even in the best regulated stage army, becomes entangled in his legs, the incident is greeted with peals of laughter, and the unfortunate culprit is hooted off the stage, only to receive the curses of the hero, whose stately exit has been unluckily interrupted. It is somewhat surprising that, amid the many reforms of the modern stage, the claims of the super still remain unrecognized. The constant protests against what is known as the "star" system have never taken account of the super's modest and necessary exertions; and even the vaunted *régime* of the Comédie Française does not afford a means of bringing the exercise of his talents directly to the notice of the world. It would be scarcely wonderful if such long and persistent neglect had bred in the super himself a cynical disposition. The titles and dignities so freely lavished upon him, and even the splendid raiment in which he is clothed, can only serve to reinforce the conviction of his own personal obscurity. Bitterly resenting the unmerited neglect he is fated to endure, the super must doubtless secrete in the course of a long career some trenchant and withering criticisms upon the heroes he is called upon to serve. The confessions of a super would form a very interesting contribution to dramatic literature. The publication of such a document could not but serve to lessen the pretensions of a number of eminent performers, and it may be doubted whether even the opinions of a *valet-de-chambre* would more effectively undermine the foundations of an actor's glory.

There is perhaps no immediate danger of such a terrible exposure. The super has not yet realized the extent of his power. At present he suffers in isolation, and the pride of the artist's nature does not permit him to use the powerful engine of combination which has been so successfully employed by the skilled artisan. But there are limits to the patient endurance even of those who have no higher lot in life than to hedge in the divinity of a stage king. Under strong provocation the super will be found to possess the ultimate resource of the worm, and a case that has recently been reported ought to serve as a warning to the profession that even the most autocratic manager cannot with impunity kick "a captain of the guard." It would seem from the evidence given before the magistrates that the captain of the guard at the Birmingham Theatre does not possess that strict sense of discipline which we have a right to expect from a soldier of his rank. He has been performing a double part in a comic opera called the *Sultan of Mocha*, and the rapid change of identity seems to have baffled the resources of his genius. He had to "go to the property-room to get a sword"; but when he arrived at the entrance of the stage the curtain was up, and the officers of the guard were left to face the gaze of the public without the encouraging guidance of their commander. Under these trying circumstances the zeal of the manager overcame his discretion, and, according to the captain's own account of the matter, he was unceremoniously kicked into his place. The manager, however, avers that he merely gave him a friendly push, and that this was dictated by a proper desire to complete the Sultan's army; but in any case the incident appears to have had an unfortunate influence upon the exercise of the super's talent, and to have left him in some confusion as to his real place in the performance. Upon being pressed by the magistrates, he was not very clear as to his rank or position in the army of his royal master, and he could not be persuaded to commit himself to anything more positive than that he "had a sword and the others had spears." It is obviously impossible that subordinate characters can be fitly impersonated if the actors are not informed of the nature of their duties. There is a story of a super who was animated by so strong a devotion to his art that he insisted upon being furnished with a copy of the play in order that he might "study his situations," and such excess of zeal is certainly to be preferred to the careless indifference of an actor who cannot tell whether he is a "captain of the guard" or a common soldier. Such a deplorable confession only shows that the super is beginning to pay back in kind the neglect of which he has so long been the victim. If he chose to seek such occasions of revenge, there is no doubt that he could make things exceedingly disagreeable even for the most eminent performers. A monarch whose subjects did not shout with joy at his approach might be left in a very awkward predicament, and the hero of a thrilling situation who could not count upon the threatening murmurs of the "crowd without" would be apt to cut a poor figure upon the stage, and to be deprived of the sympathies of his audience. Every consideration of prudence no less than of art points to the necessity of conciliating this oppressed race. A clown who means to make an effective exit cannot afford to quarrel with the gentlemen whose duty it is to hold the blanket for his reception. The heroes and heroines of tragedy have equal need of sympathetic support, and there is scarcely a play of any sort which might not be rendered ridiculous if the supers engaged were permitted to indulge in cynical disregard of their very grave responsibilities.

An incident which has just happened at the Standard Theatre gives a sufficiently grave and serious import to these observations. The super has constantly to discharge duties in the course of a drama which necessarily involve a certain amount of real danger to the performers, and the narrow escape of one of our leading actresses proves how necessary it is that such duties should be entrusted to thoroughly responsible persons. Most of our readers are doubtless familiar with Miss Wallis's earnest and effective performance of Mr. Wills's romantic play of *Ninon*, but it has perhaps not occurred to any one that to the intellectual labours of the representation there was added an element of personal danger. The public has been so often assured of the perfection and safety of every stage device that even the spectacle of a house in flames fails to awaken any other sentiment than that of curiosity. The incident to which we refer shows clearly, however, that this feeling of confidence is not always well founded. The performance of *Ninon* has recently been transferred from the Adelphi to the Standard Theatre, and the structure of the drama has been altered so as to substitute a tragic ending to the fortunes of the heroine. In the conduct of the closing scene the mob shoot down St. Cyr, and Ninon in a spirit of self-sacrifice interposes her own body to save the life of her lover. It appears that the pistol with which she is wounded has been usually discharged by an actor duly informed of the precautions necessary in such cases. On the evening in question, however, this actor was not to be found, and one of the supers was hastily summoned for the work, with instructions to fire at a certain cue. The man, so it seems, was wholly ignorant of any other than his ordinary duties, and no one had taken the trouble to ascertain that he was fit for his work. When the appointed moment arrived he fired according to his directions; but, instead of raising the pistol, he proceeded, with most unfortunate devotion to his part, to point it at the face of the actress. Fortunately for herself, Miss Wallis perceived his mistake in time, and was quick enough to avoid the shock. Had she shown less presence of mind, it is probable she must have suffered very serious injury, and it is at least certain that the explosion of gunpowder so near her face would have resulted in permanent disfigurement. The report in the *Era* from which we have taken these facts adds that the imminence of the danger, and her very narrow escape, produced a feeling of general consternation in the theatre. Such an alarming circumstance, though it has happily produced no grave results, must tend to shake the confidence of the public in the boasted precautions which managers are supposed to take in regard to the conduct of these thrilling stage effects. Here is a form of danger not to be provided against by any kind of restrictive legislation. We may pass laws to forbid reckless acrobatic performances, but no law can guard the public or the profession from the evils of a grossly careless system. The discharge of a pistol on the stage is a thing of no danger in itself, if only it is entrusted to capable hands; but when any inexperienced performer, hired perhaps only for the night, and wholly unused to the ways of a theatre, is left to the guidance of his own intelligence, it is not very surprising that accidents should occur. The only matter for surprise is that they do not occur more often;

and in view of the facts which this incident has served to disclose, the public, we think, has a right to demand that managers shall use greater caution in the selection of their servants, and that they shall at least display the common prudence which the most careless person would observe in the conduct of his own business.

THE AMERICAN RAILWAY CRISIS

AN important American Railway Company has stopped payment, causing a sensation approaching almost to panic in the stock markets of the United States, and reacting with great force on this side of the Atlantic; and fears are expressed that the disaster may be the beginning of another period of depression such as we have so lately passed through. These fears appear to us greatly exaggerated. There are no grounds for supposing that the prosperity of the United States has received a serious check. It is too real, and based upon foundations too solid, to be so easily shaken. It has its origin, as we know, in the migration of vast numbers of work-people after the crash of 1873 from the towns to the country, in the consequent settlement of vast tracts of previously unoccupied land, and in the resulting extension of cultivation. This primary cause of recovery has been assisted by steady thrift, by reductions in the cost of production, by a succession of three abundant harvests, and by a series of very bad harvests in Europe, giving an unusual demand for those bountiful crops. A prosperity so genuine is not destroyed by a brief fit of recklessness. Besides, the telegraphed quotations of the New York market bear none of the traces of a real crash. We know from experience what are the accompaniments of the kind of crisis which winds up a period of inflation. Money is scarce and dear, bankers being timid and making their customers pay smartly for the accommodation given; at the same time. traders generally need balances, either to make immediate payments or as a safeguard against contingencies, and there is a pressure to realize securities for which a market can be found. If, then, the condition of things at New York were now serious, we should look to find the rate for call money very high—a heavy commission being charged in addition to the extreme legal interest; and we should also expect large quantities of United States bonds to be thrown upon the market so as to break down prices. But there are no such symptoms of stringency. Evidently the money market is easy, and Government bonds are so steady that, if we confined our attention to them, we should never suspect that the Stock Exchange was agitated. Of course there is apprehension in the money market. In the nature of things there must be, and a study of last Saturday's returns of the New York Clearing-house banks affords the evidence of it which we were prepared to find. But there is nothing of that panic which with ourselves, for example, would send the Bank of England rate up to 9 per cent.

As to a person standing on the seashore the tide seems to recede after every advancing wave, there are in all great social movements rebounds, during which, to the casual observer, the ground previously gained appears to be lost. There is no such thing in human affairs as continuous, unbroken progress, and, least of all, in commercial and financial matters. When a long period of depression is coming to an end, those who are exceptionally well placed to note the first stirrings of re-awakening activity, and whose experience and quickness of observation qualify them to read the significance of facts that escape the uninitiated, begin to buy the commodities and securities which they foresee will soon be in general demand; a larger number, who have confidence in the judgment of the former, follow suit, and there is a sudden rise of prices, to the surprise of the ordinary public. Stories get afloat of fortunes made in a short time, and multitudes rush in, hoping to grow rich without toil and without the tact, study, and experience that would carry them safely through the ventures they have embarked upon. Then comes the time for the far-seeing to sell. Just as exceptional information and rare intelligence led them to feel the coming rise, so, by a kind of instinct, they recognise when it has gone far enough. And when they begin to sell, their imitators, as before, follow their example. To borrow the slang of the Stock Exchange, the consequence is that "more stock than they can carry is left in the hands of weak speculators." In other words, the men of special information, sound judgment, wealth, and high credit gradually rid themselves at a profit of their speculative purchases, and there are left an excessive proportion of the rash, the ill-judging, and the poor. It sometimes happens that the general public is taken by the speculative mania, and that thus the movement is protracted and exaggerated beyond all bounds. But usually the speculators go too quick for the public; and then the bankers, who have made advances on the commodities and securities purchased, find that it is time to draw in. The demand for accommodation grows as the sounder speculators withdraw, and the value of money consequently rises. The speculators are at length forced to sell, and the markets droop. In the United States a variety of circumstances have helped to enhance the value of money. The general prosperity, the immense crops of grain and cotton to be exported, the increase of employment, and the upward movement of wages and prices required a great enlargement of the currency, and as the Treasury notes are limited by law, and the bank-notes are practically limited by the conditions under which they are issued, the increase could come only by an addition to the metallic currency. All through the spring, therefore, money was excessively dear and scarce, and in New York, the commercial capital of the country and its banking centre, the scarcity and dearness were aggravated by an unwise attempt to exclude the competition of foreign bankers. The speculators after a while began to discover that the rate of interest charged them was so heavy as to make it highly improbable that they could gain, however the market might go, and many of them sold. The fall in prices thus induced caused further sales, and as the downward movement continued anxiety grew into alarm. The moment was now favourable for the more unscrupulous speculators, and they proceeded by devices in which they are skilled to depress prices still more. If "the railway kings" did not join in the "raid," they at least did nothing to counteract it, and it was a subject of general comment in New York that the stocks in which Mr. Jay Gould, Mr. Vanderbilt, and others are interested fell day after day without the usual purchases by these gentlemen and their friends to sustain the market. At last, after more than a fortnight of these tactics, the suspension of the Philadelphia and Reading Railway Company was announced at the end of last week. Coming upon a market already broken down, this suspension caused a regular scare, which has not yet subsided, and whose effects, as we have already remarked, have made themselves seriously felt in Europe.

The Philadelphia and Reading Railway Company has been in existence since 1842; and, as it serves an old-settled industrial district, it was long a prosperous concern, and paid high dividends. The railway was built to open up the anthracite coal region of Eastern Pennsylvania, which previously was dependent for the conveyance of its commodities upon canals liable to be frozen in winter, the very season when coal is in most demand. And the line is still a mineral one, though it has also a considerable oil and passenger traffic. As long as it confined itself to its proper business it prospered; but, as competition increased, it endeavoured to protect itself by extending its operations. In the first place, it amalgamated with itself, by purchase or lease and by guarantee of debts, a large number of smaller lines; and, as so often has been found to be the case in this country, the advantages obtained frequently did not make up for the liabilities incurred. But the great mistake was committed ten years ago, when the Company proceeded to buy vast properties for the purpose of working iron and coal mines. In other words, in the hope of defeating competition, it subordinated its proper functions as a carrier to its interests as a coal and iron owner. The result could not be doubtful. It did not manage the coal and iron properties in its own name, but set up a fictitious entity known as the Philadelphia and Reading Coal and Iron Company. But as the Railway Company owns all the shares of the Iron and Coal Company, we need not say that in fact the shares have never been subscribed, and have no existence distinct from those of the Railway Company. Moreover, the lands have never really been paid for, the purchase-money consisting of bonds given by the Railway Company, secured by mortgage executed in favour of the vendors. For five years after this transaction the Company went on paying high dividends, but this came to an end in January 1876, since which time the shareholders have received nothing. Matters went from bad to worse. Part of the interest on the debt was paid in paper, then the wages of the Company's servants fell into arrear, and were covered by the issue of "deficiency certificates," and finally the floating debt grew to an embarrassing magnitude. A large proportion of both shares and bonds was held in this country, and as the holders got alarmed, the President of the Company came over to reassure them, and to a certain extent he succeeded. The revival of trade encouraged the hope that the worst was passed, and that with the strong demand for iron that grew up the Company would once more see prosperous days. The hope was flattered by the report issued by the Directors in January last, which held out the prospect of an immediate and extraordinary improvement. How baseless the hope was in reality is now proved by the result. But, in truth, the report itself contained evidence which ought to have warned those concerned that the Directors' estimates were grossly extravagant. The fact is that, in spite of the purchase of the coal and iron lands—in spite, too, of a considerable increase of the mileage worked, and of an augmentation of the oil traffic—the total earnings of the Company have increased but little during the last ten years. No doubt, the depression existing since 1873 must be allowed for, and its influence in keeping down the price of coal as well as in checking the growth of business generally. But, on the other hand, it is to be borne in mind that the dearness of anthracite coal restricts its consumption, and that the bituminous coal of Western Pennsylvania is in consequence used for many purposes for which the anthracite is more suitable. But however this may be, there is no doubt that the railway is still a valuable property, and may be made very much more so by good management. To secure good management with reorganization ought now to be the object of its owners and creditors.

THE PICTURE GALLERIES.—IV.

THE notice of the Royal Academy exhibition given in these columns last week stopped at the fourth gallery. The fifth room contains two battle-pieces, both dealing with the same period, to which reference has already been made—Mr. Wood-

ville's "Blenheim" (453), and Mr. Crofts's "Marlborough after the Battle of Ramillies" (459). To our thinking, the former of these is far the better work, in its spirited intention and execution and in technical qualities. The figure of the Duke, which must be the centre of attraction in both works, has a fine character and a commanding aspect in Mr. Woodville's which Mr. Crofts misses. Mr. Crofts's work has further a distressingly smooth and clean aspect. It is carefully composed and painted; but it fails to give the suggestion of the passion and turmoil of battle which Mr. Woodville has succeeded in catching; or, in other words, Mr. Woodville's picture, while not inferior to the other on the ground of skill in drawing and painting, has a quality of life which Mr. Crofts has not given to his work. This room contains several clever landscapes, among which we may mention one by Mr. Bolton Jones (449), painted somewhat in the manner of Mr. Parton, who seems to have set a distinct fashion by his success of last year, "A Nook in Nature's Garden" (460), by Mr. Aumonier; "Littlehampton" (487), a very clever and true evening effect, by Mr. C. W. Wyllie, and "The Turn of the Tide, Sloughden" (494), by Mr. James W. Smith, the pleasant feeling of which atones for certain technical faults. Mr. C. E. Johnson's "Woodland Stream" (472) is a fine and straightforward rendering of a simple and beautiful English landscape. There is no striving after prettiness or effect; the painter gives us what he saw in a very attractive form. Mr. Colin Hunter has in this room a picture, "The Silver of the Sea" (506), which we cannot think at all worthy of his reputation or of the talent which he elsewhere displays. The picture depends for its success, in the first place, upon the painting of the water, which appears to be the reverse of true; while the background, carelessly and unhappily dashed in throughout, shows in one place an amazing want of attention. We refer to the solitary sail of a boat which seems to be literally seen through the hillside at the extreme back. The line of this hillside traverses the sail which is supposed to be seen far in front of it. Mr. Hunter's strange want of care in this picture does not speak hopefully for the future of a painter who at one time seemed full of promise. We return with pleasure from this to Mr. Herkomer's "God's Shrine" (468), which we have no hesitation in describing as the finest landscape of the year. Its truth and its splendid effect go hand in hand. The grand solitude of the view, broken by no living figure, the sweep of the clouds rolling before the evening wind along the mountain ridge, the white moon standing out against a cloud which holds the last fine tints of sunset—in short, the breadth, the accuracy, and the poetic feeling of the whole work combine to produce an effect which no other picture of the kind this year approaches. Two of the most promising of rising artists exhibit pictures in this gallery. Mr. Andrew Gow sends "The Last Days of Edward VI." (490), with a quotation from Mr. Froude's History:—

> As to the King's health, sire, it is still the same as I wrote you on the 27th ult. Since then he has been shown at a window at Greenwich, when many saw him; but in such a plight, so weak and wasted, that the people said it was death. This was done because the Commons began to murmur and to say that he was dead.—Letter of Ambassador Scheyful to Charles V.

The composition of Mr. Gow's picture is decidedly fine, and the figure of the young King, whose drooping and deathlike hand a greyhound is licking, has true pathos. The painting seems to us to miss the strength and solidity observed heretofore in Mr. Gow's work. Mr. John Collier exhibits "Mrs. Mortimer Collier and Children" (455), a work of which the details are more satisfactory than the general composition. The painting is throughout strong and good, and is perhaps at its best in some of the things which seem to us least well put together. The attention is distracted from the principal figure by the care and skill given to such surrounding objects as a cabinet with glass doors on the spectator's left, and a table encrusted with mother-of-pearl on his right. While, as we have said, the painter's skill is seen in each individual piece of texture or furniture, the whole scheme of colour does not strike us as fortunate. There was surely no necessity for the cold grey which, seen at the back of the yellow sofa on which there rests a fine mass of golden hair, seems to accentuate a certain incongruity of colour. However unsatisfactory or unattractive the picture may seem as a whole, its separate parts show that Mr. Collier's command of the technical side of his art is increasing.

In the sixth gallery the most remarkable work is M. Van Haanen's "Pearl-Stringers in Venice" (579). It would not be easy to praise too highly the life and movement, the grace of composition, and the fine colour of this picture. Besides this M. Van Haanen's painting is technically of the highest quality. His paint is laid on, when occasion demands, boldly and freely, but without a touch of the slap-dash method which too often apes breadth of effect; and some singularly fine and delicate touches are found where the painter's artistic sense has shown him that they are demanded. This room, like the one just noticed, has several landscapes of merit. There is much grandeur in the angry sky, the reeds bending beneath the swelling wind, and the rushing water in Mr. Keeley Halswelle's river-scene (522); but there is an unlucky want of transparency in the water which occupies the immediate foreground. Mr. Frank Walton's "Down in the Reeds by the River" (529) is as effective as it is truthful, and Mr. Hennessy's "Summer Days" (555) has much grace and tenderness. Mr. Watson Nicol sends a very clever *genre* picture, "A Nightcap" (543), and Mr. Claude Calthrop exhibits a very well painted picture, "Parted, 1793," the nature of which can be guessed from its title. The dramatic feeling of the work is perhaps inferior to its technical skill, which is considerable. Mr. Thomas Graham's "Passing Salute" (574), a boat leaving or passing a lonely lighthouse, the occupant of which interchanges greetings with the boat's crew, has fine qualities which ought to have insured it a better place than it has.

In the seventh room hangs Mr. Prinsep's large picture to which we have already referred (625). With this it might not be difficult to find certain faults; but, even if they were not outweighed as they are by the merits of the work, it would be ungracious to pick holes in the execution of an extraordinarily difficult task, which Mr. Prinsep has, it seems to us, discharged with very remarkable strength and skill. One of the finest subject pictures in this gallery, and also one of the finest in the whole exhibition, is M. Munkacsy's "The Two Families" (650). The subject is of the simplest kind, and has been treated with consummate feeling and science. Another remarkable picture is Mr. W. Logsdail's "Vischafslog op de Vischmarkt te Antwerpen" (662), the truth and strength of which make one hope much from its painter. The President exhibits two pictures, one of which, "Crenaia" (655), a girl's figure, one longitudinal half of which is shrouded in light drapery, is extraordinarily beautiful. The unconscious grace of the figure and the loveliness of the painting are in accord with the original and charming idea of the picture. Sir F. Leighton's other picture in this room, "Psamathe" (614), is less happy on account of the odd drawing of one of the shoulders. But for this the figure is full of grace and tenderness. Next to this hangs "The Ebb-Tide on the Bar" (613), by Mr. Walter Shaw. This is the picture to which we referred last week in connexion with Mr. Brett's fine sea-piece. With the water in Mr. Shaw's work not one fault, so far as we can see, can be found. The sky is more open to criticism. Its unnatural sameness of tone gives it a flat look. But the picture is a striking work, full of performance, and fuller still of promise.

The Lecture-Room contains two pictures which bear the title of "Daphne." Of one of these it is not necessary to say anything. Of the other, which is numbered 1046, and is painted by Mr. G. A. Storey, it is as necessary, as it is unpleasant, to say something. We called attention last week to a charming picture by Mr. Storey in another room. Why he should also have exhibited this monstrous production it is impossible to conceive. On first seeing it, a name which two years was in the mouth of most visitors to the Academy rises to one's lips. One looks at the Catalogue and finds that the astounding "Daphne" is the work, not of an Academician whose hand may naturally have lost its cunning, but of a rising Associate. One then debates whether the pose, the drawing, or the colouring of this amazing work, which is hung, as if in irony, upon the line, is most atrocious. The question is one which no amount of reflection can decide. Among the landscapes in this room, far the best is Mr. H. Moore's "The Beachèd Margent of the Sea" (973). In this, with an exhilarating sense of open air, there is a splendid glow cast over a roughened sea which catches the sunset's glory. Another sea-picture in this room, Mr. C. Napier Henry's "With Wind and Tide" (955), is admirable in its drawing, colour, and movement.

The tenth gallery is not rich in pictures of striking interest, though it contains many works of more than average merit. Mr. Herkomer's "Wind-Swept" (1460) commands attention by the same qualities of grandeur, freedom, and solemnity which mark the landscape which we have already noticed from the same hand in another room. Mr. Frank Dicksee's "Benedicite" (1473) is a remarkably fine and delicate piece of work which gives welcome evidence that in Mr. Dicksee's case success has not produced a touch of carelessness. Mr. Leader, in whom success certainly has produced a monotonous carelessness, sends two highly artificial and, according to his method, conventional pictures, one of which, "A Gleam in the Storm" (1480), with its lime-light effect on canvas-rocks, is little short of ridiculous.

In leaving this year's oil-paintings at the Academy it seems desirable to call attention once again to some of the faults of mismanagement which have grown up in and around a yet respected institution. We have said that the hanging this year is better than it has been of late; but, under the present conditions, no hanging can be satisfactory. The number of pictures sent in, whether by Academicians, Associates, or mere painters, ought to be curtailed; and it is surely not impossible to provide against the ridiculous rule which allows Academicians to hold themselves up to public contempt by the exhibition of pictures which cannot be rejected. At present the regulations of the Academy are certainly more worthy of blame than are the persons who have the ungrateful task of carrying them out.

THE DERBY.

IN spite of Sir Wilfrid Lawson's lecturing, there was a large assemblage of members of both Houses of Parliament at Epsom on Wednesday last. The excellent baronet had preached a beautiful sermon in the House of Commons the night before upon the iniquities of racing, which he described as "an organized system of rascality and roguery from beginning to end," and he gave out that his idea of the pleasures of the turf consists in "sitting on a stand in a cloud of dust, surrounded by a crowd of bawling blackguards, to

see a score of horses gallop past at the top of their speed." After his eloquent and edifying homily, it must have been mortifying to the speaker to be scoffed at by a wicked man who not only shamelessly owned that he had just returned from the scene of sin and wickedness which the preacher had been denouncing, but actually had the effrontery to quote the *Licensed Victuallers' Gazette* in order to prove that more than half the horses which were going to run for the Derby belonged to distinguished members of the Liberal party.

Many people who care little, if at all, for racing, have taken an interest in the Derby of this year. A great Duke, in whose family racing is a tradition, owned the leading favourite. Fond as many Englishmen are of betting, the general feeling among the respectable classes throughout the country is against it; yet at the same time most of our fellow-countrymen, however strait-laced, feel more or less pride in the national sport of horse-racing. When, therefore, a nobleman who cares nothing for betting or gambling races for the simple love of the sport, he is certain to meet with a large amount of public sympathy. It was well known that the Duke of Westminster had given very large sums for race-horses during the early part of his racing career, with but little success, and yet he had persevered with great spirit. Last year he owned several two-year-olds of exceptional merit, and there now seemed to be every prospect of his winning the Derby. The fact of the Duke's father having owned the famous Touchstone gave him, in public opinion, a sort of hereditary right to success upon the Turf; and thus, all things taken together, he became quite a popular hero among those who take any notice of racing affairs. His principal champion for the Derby, Bend Or, was a bright chestnut colt, with a remarkably light mane and tail. He is by Doncaster, and as a two-year-old he had run five times without getting beaten. He had beaten ten horses in his first race in a canter, thereby earning 1,130*l*. for his owner. In his next race he had beaten seven opponents and won over 1,700*l*., and in his third race he had picked up 1,340*l*. and beaten eight other horses. In his next race he only won 831*l*., but he beat a large field; and in his last race he had taken 567*l*. and again a good field was behind him. Reason as they might, racing men had no right on public form to come to any other conclusion than that Bend Or had the best claim to the position of favourite of all the horses entered for the Derby, and as he was the property of an extremely popular Duke, the horse necessarily became a great favourite in something more than the gambling sense of the word. No secret was made about his trials, and the owners of other Derby favourites were invited to see him take his gallops. But Bend Or was not the Duke of Westminster's only representative in the Derby. Another chestnut horse, and a half-brother of Bend Or, was also to run in his interest. This was Muncaster, who had only been beaten by a head, after a hard struggle for the Two Thousand Guineas. He had appeared to be winning that race easily, and his sudden defeat had been attributed by the learned in such matters rather to the fact of his never having run in public before than to any cowardice or want of staying power. Although taller, he was not so good-looking as Bend Or; but nevertheless he was a very nice sort of horse to have as a second string, and few men have ever owned a couple of horses on a Derby morning which seemed so likely to win the race between them.

Among the leading favourites was Robert the Devil, who, like Bend Or, had never been beaten as a two-year-old, with this difference, that he only ran twice at that age, whereas Bend Or had run five times. As a three-year-old Robert had come out in the Craven Meeting, and although odds had been laid on him, he had been beaten by a head in the Biennial, over the Rowley Mile by Apollo, to whom he was giving 4 lbs. Apollo is by Kingcraft; he never ran last season, but although he had won both the races for which he started this year, he was considered by judges to be on too small a scale to have much chance of winning the Derby. It was generally believed, too, that speed rather than staying was his forte. One of the most uncertain horses in the race was Mask. After running in and out in an inexplicable manner as a two-year-old, he appeared at Newmarket in the Spring and received a beating from Merry-go-round. Afterwards he ran nowhere for the Two Thousand, and it was naturally supposed that he had lost the form that he had shown last season; yet in the Second Spring Meeting he came out in the Payne Stakes, with 16 to 1 betted against him, and beat Elizabeth, the winner of the One Thousand Guineas, Abbot, who had run third in the Two Thousand, and nine other horses. Racing critics pointed out that Abbot was catching him very quickly at the finish; but Mask was in front when the winning post was passed, which, after all, was the important matter. Many people fancied Valentino, a good-looking horse which had anything but a successful two-year-old career. Another horse which had not distinguished itself as a two-year-old was Ercildoune, whose only performance had been to run nowhere for the Prendergast Stakes. Yet this colt became a favourite. His breeding was excellent, as he was by Rosicrucian out of Anderida. Draycott had won the Nursery Stakes at Goodwood, and Fire King had won the Great Sapling Stakes at Sandown. Pelleas, by Parmesan, had won the only race for which he started last season, and this year also he had won a race. Von der Tann by Vanderdecken won a race last season; but he had run very ingloriously on several occasions.

The day of the Derby was extremely hot, and the ground was as hard as iron. There was a large crowd in the paddock; but all Peck's horses were saddled in the private grounds of Lord Rosebery, so Bend Or, Muncaster, and Ercildoune were not harassed by a mob of critics until a short time before the race, when they took a few turns round the public saddling-paddock before starting for the course. As the horses cantered past the stand the grand action of the favourite was very noticeable. Nineteen starters went to the post, and after a little delay, they walked abreast for a short distance, and then went away at once without a single false start. As they ran into the straight Robert the Devil was leading, and he soon came clear away from the rest of the field. Bend Or, who had been lying in the ruck of the field, now came forward; but his jockey was hard at work upon him, while the rider of Robert the Devil was sitting quite still, and it seemed as if the last-named horse had the race in hand as they passed the grand stand. The ring men were delighted, as the defeat of Bend Or would have been a mine of wealth to them. They roared with joy as the horses passed the post, for it seemed from the common betting ring as if Robert the Devil had won; but their rejoicing suddenly fell flat when they saw Bend Or's number put up first, and Robert the Devil's second. The fact was that within a short distance of the winning-post Bend Or had rushed up to Robert the Devil like a flash of lightning, and had just succeeded in securing the race by a head. He is a remarkably handsome horse. His very walk is perfection, and his gallop is worth going a long way to see. His arched neck and blood-like points, too, add much to his good looks; but he seems a little light, and it can scarcely be said that he has a very wear-and-tear appearance. His jockey, Archer, had been severely bitten by a savage horse in the spring, and there had been some doubt whether he would be able to ride in the Derby; but he got well in time, with some days to spare, and he had ridden four horses to victory on the day before the Derby. In the latter race he wore a small shield, with a *bend or* across it, on the left side of his yellow satin racing-jacket. Robert the Devil, who ran second, is a very handsome dark bay horse, but he is rather light and narrow, and he is somewhat deficient in muscle. Mask, who was third, is not on a large scale, and he has an indifferent middle piece; but he has a good forehand, and his hips are remarkably muscular. The state of the ground was particularly well suited to lightly-framed horses, such as Bend Or and Robert the Devil. We could not help wondering what the result of the race would have been if the course had been ankle-deep in mud, as it was last year.

A notice of the Derby of this year would be incomplete without mention of the catastrophe which befell Beaudesert, the winner of the Middle Park Plate. Although he had not been placed for the Champagne Stakes at Doncaster, this colt started first favourite for the Middle Park Plate, and he won the race by half a length, beating a field of seventeen horses. He was purchased last autumn for 7,000 guineas, with a view of winning the Two Thousand Guineas and the Derby of this year, for the first of which races, as we pointed out in a former article, he was disqualified through the death of Lord Anglesey. It was considered a great piece of good fortune that he had been entered for the Derby in Mr. Brown's name, instead of in that of Lord Anglesey, and he became one of the leading favourites for that race. So late as the 10th of May Bend Or was first favourite at 4 to 1, and Beaudesert was second favourite at 5 to 1. There had been reports in circulation for some months that Beaudesert had got what is technically called a bowed sinew on one of his fore legs, and that he wore plasters and a bandage. On the other hand, it was said that he had had this malformation as a yearling, while some said he had been foaled with it. His backers were comforted with the assurance that his leg had been at any rate in the same condition when he was purchased last autumn for such an immense sum of money, and that he had then been passed sound by an eminent veterinary surgeon. He was reported to be going on admirably with his preparation for the Derby, when suddenly the news came that he was lame. It seems that, after a gallop with some other horses in the same stable, the colt was pulled up lame, and that all hope of his starting was at an end. There appears to be a fate against winners of the Middle Park Plate winning the Derby. The Middle Park Plate was instituted with the idea that it was to be *par excellence* the great trial of two-year-olds, and that the winners would in all probability secure the great three-year-old races of the following year, especially the Derby. What has been the fact? Instead of proving a guide to the Derby, during the fourteen years that the race has been in existence not one of its winners has afterwards won the Derby, although they have occasionally won the Two Thousand or St. Leger. Several have turned out screws as three-year-olds, notably Green Sleeves, Beauclerc, and Beaudesert. The question presents itself whether such a two-year-old race as the Middle Park Plate is desirable. As it is very valuable, and great prestige is attached to winning it, two-year-olds are trained for it up to a point which is very trying to such young animals. It is often a very severe race, and it is far from impossible that, instead of the winner being likely to take the Derby in the following year, his training for the Middle Park Plate and his hard race for it may be the actual cause of preventing him from winning the greatest prize of the British Turf.

REVIEWS.

SAYCE'S INTRODUCTION TO THE SCIENCE OF LANGUAGE.*

THE rapid rate at which philological research and speculation are pushed on is certainly surprising, and to some persons may perhaps be not altogether pleasant. Many who are not yet far advanced in age were subjected to a teaching which in language was as thoroughly empirical as that of Greek boys in the days of Aristotle. In this comparatively short interval the scientific method has worked a wonderful change, and it now threatens to sweep away not a few conclusions which have been regarded of late years as solid and well-established, and in many points to reverse the notions formed as to the processes by which the origin and growth of language were brought about. This purpose of radical reform is put forth by Mr. Sayce with startling clearness. His volumes will certainly introduce the reader to the science with very sufficient completeness, but they can scarcely fail to leave him with some iconoclastic inclinations, which may for a time at least be but poorly gratified. We are not tempted, however, to turn aside from theories or suggestions merely because we dislike the consequences involved in them; and if we regret the recommendation of some changes of doubtful advantage, and of others which seem impracticable, we are ready to welcome, if it be forthcoming, evidence which may conclusively show that ideas entertained even by the greatest philological scholars and thinkers must be given up. The progress of science can be stayed for no man; and we may be very sure that the discovery of truth will more than make amends for any sacrifices demanded of us. But we have first of all to take care that the truth is really discovered; and we are at least justified in reserving our judgment, if we find that the adoption of a given method is followed by the invasion of a province which seems to lie beyond the range of the science in question. We may read patiently the evidence or the arguments which are to prove that the human faculty of speech lies chiefly in some folds in the left hemisphere of the brain, or to show that from the *homo alalus*, or speechless man, branched off, according to the favouring or unfavourable circumstances of their condition, the several tribes of gorillas, chimpanzees, and orang-otangs on the one side, and the ancestors of articulate human speakers on the other. But the theories of the best-known philologers have of late years been so rudely shaken, and many of them are so roughly dealt with by Mr. Sayce, that we may prefer to wait and see whether some of the notions recently put forward may not, in their turn, be thrown aside. Meanwhile we may fairly decline to admit that any researches into the physical organs of speech or into the storehouses of either living or dead dialects can touch that spiritual order of things to which man belongs as much as he belongs to the sensible world, or in any way affect interests of infinitely greater moment than those by which he is here surrounded.

The work of pioneers in a new science must, in almost all instances, be of necessity destructive at the outset. There is perhaps no science which has not suffered at first from the intrusion of men who are content to guess at haphazard, or whose honest efforts to get at the truth have been thwarted and frustrated by the circumstances under which they were compelled to work. The ordinary systems of grammar which have come down to us through the middle ages are an inheritance which must be traced back to men who had no other materials to work on than those which were provided by their own language; and the evils of which this unfortunate necessity has been the fruitful source are most carefully and forcibly exhibited by Mr. Sayce. Others, indeed, have not been blind to their disastrous consequences; but the English student who follows Mr. Sayce's guidance will see at once how powerless Greek thought necessarily was towards building up anything like a real science of language. The Greek analysed the forms of his own speech, but he did so logically, for, in truth, he could know nothing of linguistic laws; and all his attempts to lay the foundation of a scientific etymology could issue only in the multiplication of guesses, of which the few that chanced to hit the mark had no value, while the rest were either contemptible or ludicrous. Of the duty of comparing dialects and of the results which might be expected from the process he was profoundly unconscious; and Plato, when he noticed the resemblance of certain Greek to certain Phrygian words, did so, as Mr. Sayce remarks, only to draw from it a wrong conclusion. Instead of comparing the grammatical structure and forms of the two languages, he simply assumed that the Greek had borrowed these words from the Phrygian; and the subsequent conquests of Alexander, by convincing later generations of their immeasurable superiority to barbarians, had the effect of confining philological research to that one-sided and therefore erroneous exposition of the grammar of a single language which, as Mr. Sayce justly says, has been the bane of classical philology down to our own time. It would be easy to fill volumes with the absurdities which have cropped up from this fatal method. We may laugh at Junius when he tells us that *so* is merely the Greek ὥς reversed, and that *sin* is derived from σίνειν; we may be irritated as well as amused by Scaliger's assertion that the Latin *ordo* means "Thus far shalt thou go, and no further," the Tribune saying to his soldiers, "ὅρον δὸ, *inde ordo*." The truth is that the system and all its results were utterly worthless; and the explanations of Voss, Wachter, and others who have followed them, are not one whit more valuable and certainly are less amusing than those which Durandus of Mende sprinkled over his ponderous treatise on Symbolism. We may forgive the mediæval bishop who innocently remarks that *cemetery* is made up of *cimen*, sweet, and *sterion*, a station, because there the bodies of the faithful departed rest in peace; but we are tempted to be angry when we are informed that the word *cause* is either from *chaos*, from which all things have come, or from καῦσις, or *a cavendo*, or *a casu*. Mr. Sayce notices some recent volumes which would, he says, raise the envy of a Latin etymologist; but the same harvest of folly must continue to spring up so long as men go on without caring to determine the relations of one language to another by any other measure than that of their own inclinations or prepossessions.

Side by side with this useless guesswork went on the growth of grammatical science; which, following really the method of logic, led to the theory of a grammar which should be universal. But even here the ignorance of the real links and relationships of dialects worked nothing but mischief. The grammatical terminology of the Greek was translated, as it was supposed, into Latin; but the process imparted to it a very different meaning. The Greek γενική, or case of the genus, was converted into the Latin genitive, or case of origin; and the accusative, or case of accusing, was far from representing the Greek αἰτιατική, the case of the αἰτία, or object, which was blunderingly referred to the verb αἰτιάομαι, in the sense of blaming. Strangely enough, grammar was following a different course in the distant land which has furnished to Western thought the means for laying the foundations of a true philology. The Hindu grammarians were, like the Greek, able to deal only with the phenomena of a single language; but their grammatical system and nomenclature rest, Mr. Sayce remarks, on a firm foundation of inductive reasoning, and show a scientific insight into the nature of speech which has never been surpassed. This system was worked out most fully in the grammar of Pânini, which, put together in the age of Sokrates and Plato, summed up

> the principles of Sanskrit phonology, the declension of the noun and the conjugation of the verb, the syntax of the adverb and the other particles, the rules of syntax . . . the etymology of words, with an exhaustive list of primary and secondary formative suffixes, and a minute analysis of composition which has been the basis of modern attempts to deal with this intricate subject.

The language on which Pânini worked was destined to show to the nations of the Western World the relation of their dialects to those of the dwellers in the Punjab. The first grammar of Sanskrit was published in Europe by two German friars in 1790; but more than twenty years before that time the French Academy had been assured by correspondents in Pondicherry that between the vocabularies of Sanskrit, Greek, and Latin a relationship existed which could not be accounted for by the hypothesis of borrowing. Knowing nothing of the researches of these Frenchmen, Sir William Jones stated before the Asiatic Society at Calcutta in 1786, that "no philologer could examine the Sanskrit, Greek, and Latin without believing them to have sprung from some common source which, perhaps, no longer exists." Here, then, as Mr. Sayce remarks, the great discovery was made; and it was made with a sagacity which must excite our admiration. Not only was the prejudice to be overcome that Greek and Latin could have no affinity with the speech of Asiatics, but there was the temptation, if that prejudice were conquered, to rush to the opposite extreme, and to speak of the Eastern tongue as the parent of the cognate dialects of the West. The contrast between Sir W. Jones and Dugald Stewart, who insisted that Sanskrit and Sanskrit literature were forged by the Brahmans in order to deceive European scholars, is striking indeed. The work thus begun was carried on with increasing zeal and success, until it was crowned by the appearance of Bopp's *Comparative Grammar* of the most important Aryan languages. Of this great achievement Mr. Sayce says that, though much in it has since needed revision, "the main results at which he arrived will always remain among the fundamental truths of linguistic science." Unfortunately Bopp, who had gauged the relationship of the Aryan dialects of Europe with the most scientific precision, had not determined with equal accuracy the relations of the Aryan with other families of speech. Hence he felt himself justified in making use of the Polynesian dialects for purposes of comparison with those of his Indo-European family; and the result was what might have been expected from a return to the method of the Greek etymologists. But even now it can scarcely be said that we are all delivered from the house of bondage. Not many years ago we had looked upon ourselves as fairly emancipated when we had come to the conclusion that all the languages of the world might be classified under the three families known as the Aryan, the Semitic, and the Turanian; and some of us may have gone on quietly to the further idea, that all dialects were in the first stage monosyllabic, and that through the agglutinative stage they passed into the inflexional. But to lump all non-Aryan and non-Semitic languages under the common heading Turanian or Allophylian is, Mr. Sayce very rightly insists, "as unscientific as to refer Aryan and Semitic to one ancestor." The number of separate families, not merely branches, of speech now existing in the world, which cannot be connected with one another, is, he remarks, at least seventy-five; and these are but the scanty survivors of multitudes which have died out altogether—the *débris* of that enor-

* *Introduction to the Science of Language.* By A. H. Sayce, Deputy Professor of Comparative Philology in the University of Oxford. 2 vols. London: C. Kegan Paul & Co. 1880.

mous mass of human speech which, as M. Bréal has sought to show, was overloaded with its wealth of synonyms and its embarrassing superfluity of prefixes and suffixes. Thus Mr. Sayce does not hesitate to speak of the "infinite number of primæval centres or communities in which language took its rise." "The idioms of mankind," he adds, "have had many independent starting points, and like the Golden Age, which science has shifted from the past to the future, the dream of a universal language must be realized, if at all, not in the Paradise of Genesis, but in the unifying tendencies of civilization and trade."

In short, if this consummation is ever to be brought about, it must, Mr. Sayce thinks, be brought about by the process which will end in making English the language of the world. But before any such result can be hoped for, there is need, it seems, of a radical reformation. The shreds of inflexion which the language still retains must, we learn, be thrown aside; the signs of gender probably must be got rid of; and whatever other changes may be needed to reduce the language to the "Pigeon English" of which Mr. Simpson has given us some amusing specimens must be effected cheerfully and ungrudgingly. Of these changes, one of the most urgent, we are told, is the reform of the English alphabet. With attempts to accomplish this work by the method adopted in the *Phonetic News* and other like publications he will have nothing to do, for such devices "would become an antiquated abuse in the course of a generation or two." What is needed is a series of supplementary letters, possibly an entirely new alphabet. At any rate, the alphabet must be international—that is, the symbols of the vowels must possess "the phonetic powers which they had in the ancient Latin alphabet, and, generally speaking, in the modern Continental alphabets as well." With the historical considerations which have been urged against this revolution or reform, Mr. Sayce deals summarily. Archbishop Trench has pleaded with no little eloquence and earnestness against a process which would, in his belief, obliterate in great part the history of a vast number of words in our vocabulary. But such objections, we are quietly told, are "raised only by ignorance or superficiality." That the questions thus raised involve nevertheless points of real difficulty few will be disposed to deny; and some at least of Mr. Sayce's readers will feel that his suggestions as to the right method of teaching ancient and modern languages and the order in which they should be taught cannot be easily carried out under existing conditions. For ourselves, we need only say that we reserve our judgment on some points, while on others we must decline altogether to follow him. Of the goal which he is striving after we are left in no doubt; but we do not share his enthusiasm, and we are inclined to think that the Pigeon English of his distant future may be as disappointing as apples of the Dead Sea. It is but a truism to say that the patience and the time needed for the accomplishment of the work which Mr. Sayce regards as the only legitimate object of all philological efforts are not in themselves a conclusive argument for abandoning the attempt in despair; but it is, to say the least, rash to shut our eyes in the meantime to the obstacles which stand in the way, or to the serious errors into which, through a mistaken zeal, Mr. Sayce may lead his followers.

SONGS OF THE SPRINGTIDES.*

SHOULD a poet write for a little company of learned amateurs, or for the great public? Probably a poet has a right to do both, or either, when and as he pleases. If he chooses, however, to confine himself to such works as can only find hearers that are "few," whether they are "fit" or not, he must be satisfied with the applause of a very narrow circle, and resigned to the chance of losing his own breadth of vision. It seems scarcely possible to us that Mr. Swinburne's new book will prove anything more than poetical caviare. Like caviare, it has a salt, sea taste; it savours of what Plato calls "the bitter, brackish element," and it can only be much relished, we fear, by professional tasters of poetry. Some critics seem convinced that the "subject" of a poem is a matter of entire indifference. So far they are like Mr. Du Maurier's elegant young art-critic, who, being colour-blind, and ignorant of drawing, despised "subject" even more than drawing and colour. It is perhaps true, for a critical few, that a poet may as well sing of a sausage stick as of the spheres, and may write as well of the Loves of the Triangles as of the love of Othello. But the great, gross public will always be more concerned about Othello's jealousy than about that of the mathematical nymph who loved Isosceles:—

> Again she doubts him, but produced at will
> She sees the exterior angles equal still.

Mr. Swinburne has not chosen subjects quite so empty of human interest as the passions of mathematical abstractions. The subjects he has chosen, while they are almost hackneyed in his works, are little more to the public than the player was to Hecuba. In the four odes in the volume called the *Springtides*, he writes about the sea and his passion for the sea, about Sappho and his passion for Sappho, about Victor Hugo and his passion for Victor Hugo. On all these topics Mr. Swinburne has already composed abundant and admirable verse. He is, much more truly than Euripides, "a meteoric poet." What charmed and surprised most in his truly splendid poem of *Atalanta* was his love of the blind powers and vast forces of the world, "the folds and fields of air," thunder, fire, the sea, the tempest. "Men hardly know how beautiful fire is," says Shelley; and we scarcely knew how beautiful are the terrible elementary forces of the world till Mr. Swinburne sang their praise in strains of immense variety and vigour. A sonorous music as it were of chainless winds, and out-poured waters, and starry movements rang in the choruses of *Atalanta* round the narrow stage on which men and women were mastered by destiny. Perhaps the choruses in *Erechtheus*, especially that chorus in which the clash of tides and chariots, of white horses and white-crested waves, seems to sound with a mingled music, was the masterpiece of Mr. Swinburne's "meteoric" genius. In *Atalanta* and in *Erechtheus*, the elemental strife was merely a chorus, and the poignant cry of human passion was clearly heard through the din of storm and sea. But in this new volume, in "Thalassius" and "On the Cliffs," we cannot but think that the intenser interest is stifled and the shriller voice drowned by verse somewhat empty, if extremely sonorous, by songs, to quote Callimachus, ὅσα πόντος ἀείδει—songs vast, loud, and empty of significance as the sound of the sea. This is one of the reasons which lead us to suppose that Mr. Swinburne's new volume, repeating as it does only the less human triumph of his old successes, is likely to please few but technical lovers of verse. The wider public will always want more of "a story," and, in the last resort, the wider public (not that of Tupper, but that of Tennyson, Byron, and Wordsworth), seems the arbiter of the fate of song. It may be added that the obscurity of Mr. Swinburne's allusions to the remains of Æschylus and of Sappho makes much of his poem "On the Cliffs" unintelligible to that excellent creature, "the English reader." Again, the rapidity of Mr. Swinburne's thought is so great, and the length of his periods so prodigious, that, in reading one of his strophes, a man feels like a puzzled whist-player. Just as the whist-player cannot remember what cards are out, and who held what, so Mr. Swinburne's reader casts helplessly about for verbs and substantives. Here, for example, is a stanza which is rather harder reading than most sentences in Thucydides:—

> Seeing even the hoariest ash-flake that the pyre
> Drops, and forgets the thing was once afire
> And gave its heart to feed the pile's full flame
> Till its own heart its own heat overcame,
> Outlives its own life, though by scarce a span,
> As such men dying outlive themselves in man,
> Outlive themselves for ever; if the heat
> Outburn the heart that kindled it, the sweet
> Outlast the flower whose soul it was, and flit
> Forth of the body of it
> Into some new shape of a strange perfume
> More potent than its light live spirit of bloom,
> How shall not something of that soul relive,
> That only soul that had such gifts to give
> As lighten something even of all men's doom
> Even from the labouring womb
> Even to the seal set on the unopening tomb?

We say, with some natural pride, that we have puzzled out what Mr. Swinburne means by this effusion, and his meaning does equal credit to his head and his heart. But can any one seriously affirm that poetry should be so difficult?

The first piece in the *Springtides* is called "Thalassius." It is the lyrical history of a child who was found, like Arthur, on the seashore after a tempest. The infant was educated by an old poet in the love of liberty and of the sea. He made the acquaintance of Love, who rather abruptly observes,

> O fool, my name is sorrow,
> Thou fool, my name is death.

Afterwards he appears to have seen a good deal of bad company; at least, if Mr. Swinburne does not mean this, we cannot guess what he does mean. We purposely make a very long extract, as an example of Mr. Swinburne's mode of saying what he has to say:—

> And as when all the world of earth was wronged
> And all the host of all men driven afoam
> By the red hand of Rome,
> Round some fierce amphitheatre overthronged
> With fair clear faces full of bloodier lust
> Than swells and stings the tiger when his mood
> Is fieriest after blood
> And drunk with trampling of the murderous must
> That soaks and stains the tortuous close-coiled wood
> Made monstrous with its myriad-mustering brood,
> Face by fair face panted and gleamed and pressed,
> And breast by passionate breast
> Heaved hot with ravenous rapture, as they quaffed
> The red ripe full fume of the deep live draught,
> The sharp quick reek of keen fresh bloodshed, blown
> Through the dense deep drift up to the emperor's throne
> From the under steaming sands
> With clamour of all-applausive throats and hands,
> Mingling in mirthful time
> With shrill blithe mockeries of the lithe-limbed mime:
> So from somewhence far forth of the unbeholden,
> Dreadfully driven from over and after and under,
> Fierce, blown through fifes of brazen blast and golden,
> With sound of chiming waves that drown the thunder
> Or thunder that strikes dumb the sea's own chimes,
> Began the bellowing of the bull-voiced mimes,
> Terrible; firs bowed down as briars or palms
> Even at the breathless blast as of a breeze
> Fulfilled with clamour and clangour and storms of psalms;
> Red hands rent up the roots of oldworld trees,
> Thick flames of torches tossed as tumbling seas
> Made mad the moonless and infuriate air
> That, ravening, revelled in the riotous hair
> And raiment of the furred Bassarides.

* *Songs of the Springtides.* By A. C. Swinburne. London: Chatto & Windus. 1880.

> So came all those in on him; and his heart,
> As out of sleep suddenly struck astart,
> Danced, and his flesh took fire of theirs, and grief
> Was as a last year's leaf
> Blown dead far down the wind's way; and he set
> His pale mouth to the brightest mouth it met
> That laughed for love against his lips, and bade
> Follow. . . . . •

After these experiences the lad's passion for the sea overcame the lure of the "Bassarides,"

> He communed with his own heart and had rest."

That is all.

Surely it is not an unfair or captious criticism which sees in "Thalassius" a vast excess of sound over sense, a prodigality of words which do not always so much express as conceal the poet's meaning.

"On the Cliffs" is an ode addressed to the spirit of Sappho, an ode of the most strictly personal meaning. In the fragments of the Lesbian Mr. Swinburne seems to find something more than her other admirers gather; a message for his own ears, a music to the world inaudible:—

> As brother and sister were we, child and bird
> Since thy first Lesbian word
> Flamed on me, and I knew not whence I knew
> This was the song that struck my whole soul through,
> Pierced my keen spirit of sense with edge more keen,
> Even ere I knew not,—even ere sooth was seen,—
> When thou wast but the tawny sweet winged thing,
> Whose cry was but of spring.

We do not think Mr. Swinburne conceited for claiming kindred with Sappho; but let him not forget that a poetaster once addressed him as "My brother, my brother, my strong, sweet brother!"

The "Garden of Cymodoce" is said, by people who seem to have received private information, to be an ode on the island of Sark. M. Victor Hugo once visited Sark; so here we have more addresses to M. Hugo, whom we strongly suspect of being the old poet in "Thalassius." An admiring critic admits that, in the "Garden of Cymodoce," the music dims the eyesight. In a storm of beautiful but whirling words one detects a few curses of Napoleon III. Mr. Swinburne has not yet learned that "it is ill boasting over dead men."

The last piece in the *Spring-tides* is a birthday ode to M. Victor Hugo. Every one of his works is noted and described. For the sake of brevity we select the lines on the novel *Quatre-Vingt-Treize*:—

> Above a windier sea,
> The glory of Ninety-three
> Fills heaven with blood-red and with rose-red beams
> That earth beholding grows
> Herself one burning rose
> Flagrant and fragrant with strange deeds and dreams,
> Dreams dyed as love's own flower, and deeds
> Stained as with love's own life-blood, that for love's sake bleeds.

Criticism of poetry should be sympathetic, and we confess that we are not in sympathy with Mr. Swinburne's new poems. There are many noble thoughts about freedom, about M. Hugo, about the sea, and there is a bewildering opulence of diction. It is natural, in reviewing a poet who has often given the highest pleasure, to wish to be pleased. Perhaps, too, it is well to be contented with whatever work he chooses to offer. But it is no less necessary, though it seems ungrateful, to preserve spontaneity of opinion, the unsophisticated sense of what is good and what is not really excellent. Thus it is necessary to declare that Mr. Swinburne's new poems seem to us prolonged and tedious repetitions of old themes, often obscure and personal in allusion, and almost always clouded with mists of words and noisy with the shock of adjectives. They seem to fill no empty place in the sum of his work, to reveal no new power, nor even any new taste, or observation, or opinion.

MISS COLENSO'S ZULU WAR.*

FROM the preface to this volume it appears that "Colonel Durnford has written the military portions of the book, but is not responsible for any expressions of opinion upon matters strictly political." The definition thus given of the division of labour practised in the composition of this book has a somewhat feminine vagueness. There is scarcely any portion of it which has not something to do with military movements, while the more specially military portions hardly keep clear of politics for a single page. But, wherever the line may have been drawn, we are to infer that the general bias of the book is to be debited to Miss Colenso; and we must say at the outset that her general handling of the subject leaves a strong impression, which we think will be felt by every reader who takes it up without any prejudice, that he is reading a brief drawn up in the interests of one side rather than an impartial narrative. It is difficult to believe that all the European officials who have had to deal with the matters in dispute between the colonists and the Caffres—from the local Administrators who first come upon the scene to the Secretary of State who deals with the ultimate appeal—can have been so blind to the wrongs of the natives whose case had to be adjudicated on as they are here represented to be. The suspicion of onesidedness which we imbibe from the earlier pages becomes still more confirmed when we arrive at the part which deals with the events leading up to the Zulu war. If one knew nothing more of the case than could be learnt from this book, it might be supposed that Cetewayo was a perfectly inoffensive creature who was set upon by the overbearing English Governor without reason or without warning. There is no mention in the preliminary accounts of the existence of a powerful and well-organized Zulu army, or of the state of excitement prevailing among the native population throughout the adjacent British territory, which was no doubt the main reason why Sir Bartle Frere determined, whether rightly or wrongly, to put down by force of arms what he and many others who had the best means of judging considered to be a great and growing danger. Whether the High Commissioner was justified in so acting without authority from home, or, indeed, as may be said, despite of orders from home, is another matter as to which we all have our opinions. But to ignore the existence of the danger, and to assume that the Zulu King was an entirely blameless and peacefully disposed person, and that the whole fault of the quarrel rested on us, is a view of the case which it does not need much local knowledge to dispose of. Sir Bartle Frere was, no doubt, badly advised by his general in undertaking the war with insufficient means; but his rashness was not so great as might appear from the result. He could not have reasonably expected that the military operations would be so thoroughly mismanaged as they were, and it may be permitted to doubt whether, if the campaign had been carried on with more ability than Lord Chelmsford exhibited, if more care and less rashness had been shown at the outset, and more vigour and less carefulness afterwards, Sir Bartle Frere, with success for his justification, would not have been more leniently judged. But having taken upon himself the whole responsibility of entering on the war, it is no doubt only fair and proper that he should bear the consequences.

As regards the original cause of quarrel, Miss Colenso fairly argues that too much may easily be made of Cetewayo's "solemn coronation promises," as something having the binding effect of a treaty on him. We have no right to treat a Caffre monarch one day as a child—and there appears to have been a good deal of behaviour of that sort in our ceremony of crowning Cetewayo—and then to act as if he were a civilized ruler, bound by the law of nations to observe treaty obligations. There has been too much of this in our dealings with inferior races in all parts of the world. There is not an independent prince in India at this moment with whom we could not find a cause of quarrel if we were so minded, based on an infraction of treaty obligations. For an Indian prince, like a native African chief, will usually be found ready to promise anything. But admitting that, in our dealings with Cetewayo we acted too much as if Grotius were his daily reading, still no useful purpose is gained by assuming that the Zulu King was a perfectly inoffensive creature.

The case of Langalibalele, as told by Miss Colenso, certainly appears a very hard one. This chieftain had been driven out of Zululand in 1848, and was settled by the English Government in the country below the Drakenburg Mountains, with the duty imposed on him of defending Natal against the attacks of predatory bushmen. From this point of view it would seem reasonable that the Hlubi tribe—of which he was chief—should be permitted the use of firearms, prohibited under certain restrictions to the natives of Natal. Nevertheless the special accusation brought against Langalibalele to prove his rebellious tendencies was that the young men of his tribe were in possession of unregistered guns. On Langalibalele being called on to come down to Pietermaritzburg to answer for his tribe in this matter, he sent excuses and apologies, chiefly turning on his own ill-health, as a reason for not complying with the order. This was the signal for the military expedition of 1873. One detachment of the force sent out to coerce him, coming on a party of the tribe in difficult ground where they exhibited a hostile attitude, began to fall back, whereon the enemy pressed forward, and eventually opened a fire resulting in a loss of three Europeans and one native on our side. Of course the British had to go back again afterwards in larger force to settle the matter, and there appears to have ensued a good deal of barbarous warfare; but the case against the English is not strengthened by quoting all the unauthenticated rumours of the day as evidence; as that on one occasion a white commander of native forces "is said to have given the significant information to his men that he did not want to see the faces of any prisoners"; and that "it is reported that a prisoner was made over to the native force to be put to death as the latter chose." Langalibalele was brought down to Natal and there tried by a court which, according to Miss Colenso, was illegally constituted, and of which the proceedings were a mere matter of form to bring about with the semblance of legality a foregone conclusion, and the old chief was sent away to the Cape Colony, where he has been kept ever since, thereby in the lady's view being very badly treated. It is obvious to remark that there is no legally constituted court for dealing with such a case as this—not contemplated or provided for by the constitution—of the misconduct of a Caffre chief who, having been driven out of his own country, is established by us on lands to which our own title is altogether questionable; and that, if the modifications had been made in the procedure which the author thinks ought to have been made, the legality of the trial would not have been thereby enhanced, although it might have been kinder to the chief

* *History of the Zulu War and its Origin.* By Frances E. Colenso. Assisted, in those portions of the Work which touch on Military Matters, by Lieutenant-Colonel Edward Durnford. London: Chapman & Hall, Limited. 1880.

to adopt them. But the story, as told by Miss Colenso, makes out the conduct of the British officials connected with the case to have been from first to last so unfair and cruel, not to say inhuman, towards a perfectly inoffensive person, that the reader's judgment is irresistibly held in suspense until he shall have an opportunity of hearing what can be said on the other side.

There is one anecdote connected with this affair of the attack on the Hlubi tribe which deserves to be quoted, as it relates to a very gallant but ill-fated officer, whose name has of late been prominently before the public. Colonel (then Major) Durnford, of the Royal Engineers, who was leading one of the parties of the expedition, had his left shoulder dislocated and received other severe injuries, by his horse falling with him over a precipice. He was lifted on to his horse again and kept command of his force. When the stampede above referred to took place, the interpreter's horse was killed, and, "while Major Durnford was endeavouring to reach the man and lift him on his own horse, the interpreter was killed by his side, and Major Durnford was surrounded and left alone. Dropping his reins, he drew his revolver, and shot his immediate assailants, who had seized his horse's bridle, and, after running the gauntlet of a numerous enemy at close quarters, escaped with one serious wound, an assegai stab in the left arm, whereby it was permanently disabled. He received one or two trifling cuts besides, and his patrol jacket was pierced in many places. Getting clear of the enemy, Major Durnford rallied a few carbineers and the Basutos, and covered the retreat." He got back to camp in the early morning, and on the evening of the same day set off again with a party of volunteers to the rescue of a detachment which had not come back and was believed to be in great danger of being cut off. The doctor endeavoured to dissuade him from taking the command, he was in such bad case. But Durnford insisted on going, and, being lifted on to his horse, started off amid the cheers of the troops in camp, and marching all night came on the party he was in search of in the morning. This anecdote seems worth extracting, as characteristic of an officer who was distinguished as much for his personal gallantry and energy as for his kindly feeling towards the native population of South Africa, and on whom there appears to have been manifested a desire in some quarters to throw a wholly undeserved share of obloquy for the disaster in which he met his death, setting to the last a noble example of courage and devotion to duty.

Of the account of the Zulu war given in this book, and which we are to understand from the preface was contributed by Lieut.-Colonel Edward Durnford, it is not necessary to say much, as it contains absolutely nothing of importance that was not known before. It is conceived in the same spirit as the rest of the work—that is, everything that is done by every white man is wrong. Lord Chelmsford is run down, and Sir Garnet Wolseley sneered at, while the *Cape Times* is quoted with approval as objecting to the form of settlement of the Zulu country which was adopted by the High Commissioner, although it is not explained in what respects it is defective, or what better alternative could have been proposed. We cannot forbear from quoting in conclusion an amusing extract from Lord Chelmsford's reply to an address on leaving Natal, wherein he says that "any success which has attended my efforts, I feel, is due to the prayers of the people and the kindly ordinations of divine Providence, for I am one of those who believe firmly and implicitly in the efficacy of prayer and in the intervention of Providence." It would be interesting to know to which of these two disposing causes the General would ascribe the disaster of Isandula.

MARY ANERLEY.*

MR. BLACKMORE'S latest work is, we are inclined to think, one of his happiest productions. It is full of the fine touches of observation and description, whether of people or of places, that have belonged to most of his novels, and there is a strong dramatic interest to be found in it. In this respect indeed, as in others, there is as much matter in *Mary Anerley* as would make a dozen ordinary novels, and the only possible objection to be made to this is that one would like to hear more than there is room for of many persons and things mentioned by the author. Whether Mr. Blackmore is to be understood seriously when, as on several occasions, he himself regrets that he has not space to relate certain events, or whether this is a permissible device to add reality to a story already real enough, is uncertain; but we are sure that many readers will share our regret that some circumstances in the course of the narrative are merely hinted at instead of being told at full length, in spite of their having no absolute bearing upon the plot of the novel. Mr. Blackmore's choice of place and period in *Mary Anerley* helps at once to accentuate the merits and to veil the shortcomings of his style. Deliberate whimsicalities of expression seem much less out of place in the mouths of the personages to whom the author now introduces us than they have done when he has laid his scene in more modern times, and so compelled us to expect less fantastic conduct from his characters. At the same time, it cannot be denied that in his present work Mr. Blackmore is not infrequently carried away by the humour or brilliancy of his own notions into transferring them to personages who are not eminently likely to have entertained such ideas.

The story proper of *Mary Anerley* opens in the year 1801, at Scargate Hall, "in the wildest and most [illegible] part of the wild and rough North Riding"; the first chapter [illegible] practically a prologue, which sets forth the strangely dra[illegible]tic death of Squire Philip Yordas just after he had made a will disinheriting his son Duncan. Thus Scargate Hall, when first described to the reader, is the property of Philippa Yordas—"my lady Philippa," as she was commonly called by the tenants—and Mistress Carnaby, her younger sister, a widow with one boy. "'Pet' was his name with his mother and his aunt; and his enemies (being the rest of mankind) said that pet was his name and his nature." One of the first things that we hear concerning Scargate Hall is that Pet's chance of possessing the inheritance he has been brought up to expect is far from good, since Mr. Jellicorse, the family lawyer, comes by chance upon evidence of a fatal flaw in the sisters' title to the estate, and rides over to make them acquainted with this unpleasant fact. This is a striking instance of Mr. Blackmore's fine disdain of the ordinary mechanical craft of a novelist. Here is an admirable opportunity for a complication which might well form the only staple of three volumes of plotting and counter-plotting. The author, however, uses it only for the purpose of illustrating the characters of the two sisters, of Jellicorse, and of the true heir, who does not appear till towards the close of the book, and who destroys in favour of his sisters the deed which, if brought into evidence, would give the greater part of the estate to himself. From one point of view this lavish neglect of possible "situations" might be thought a mistake in art; or perhaps it would be more correct to say that in the hands of an inferior writer it might seem such a mistake. As it is, we might complain that the fulness of Mr. Blackmore's work makes it difficult to take in and appreciate completely all of the many branches of his story; but if his novel demands more thought and reflection from the reader than do a dozen every-day novels, the trouble is far better repaid in the one case than in the others. It is not until the sixth chapter of the book that we are introduced to Anerley Farm, a place about a hundred and twenty miles from Scargate Hall, and the home of the girl who gives her name to the novel. The description of its proprietor's character is not a bad example of the combined breadth and minuteness of Mr. Blackmore's style:—

> From father to son the good lands had passed, without even a will to disturb them, except at distant intervals; and the present owner was Stephen Anerley, a thrifty and well-to-do Yorkshire farmer of the olden type. Master Anerley was turned quite lately of his fifty-second year, and hopeful (if so pleased the Lord) to turn a good many more years yet, as a strong horse works his furrow. For he was strong and of a cheerful face, ruddy, square, and steadfast, built up also with firm body to a wholesome stature, and able to show the best man on the farm the way to swing a pitchfork. Yet might he be seen, upon every Lord's day, as clean as a new-shelled chestnut; neither at any time of the week was he dirtier than need be. Happy alike in the place of his birth, his lot in life, and the wisdom of the powers appointed over him, he looked up, with a substantial faith, yet a solid reserve of judgment, to the Church, the Justices of the Peace, spiritual lords and temporal, and above all His Majesty George the Third. Without any reserve of judgment, which could not deal with such low subjects, he looked down upon every dissenter, every pork-dealer, and every Frenchman. What he was brought up to, that he would abide by; and the sin beyond repentance, to his mind, was the sin of the turn-coat.
>
> With all these hard-set lines of thought, or of doctrine (the scabbard of thought, which saves its edge, and keeps it out of mischief), Stephen Anerley was not hard, or stern, or narrow-hearted. Kind, and gentle, and good to every one who knew "how to behave himself," and dealing to every man full justice—meted by his own measure—he was liable even to generous acts, after being severe and having his own way. But if anybody ever got the better of him, by lies, and not fair bettering, that man had wiser not begin to laugh inside the Riding. Stephen Anerley was slow but sure; not so very keen, perhaps, but grained with kerns of maxim'd thought, to meet his uses as they came, and to make a rogue uneasy. To move him from such thoughts was hard; but to move him from a spoken word had never been found possible.

Anerley Farm lies just outside the Dane's Dyke, which cuts off "Flamborough Head, and a solid centre of high land from the rest of Yorkshire. The corner, so intercepted, used to be, and is still called 'Little Denmark'; and the indwellers feel a large contempt for all their outer neighbours." We have quoted these few lines in order to call attention to the remarkable spirit with which Mr. Blackmore has depicted the manners and customs of this curious place. One feels as one reads that the people must have behaved and spoken exactly as the author makes them speak and behave. As Mary rides down the hollow of the Dyke on the same morning on which Mr. Jellicorse leaves Scargate Hall, "armed with instructions to defy the Devil, and to keep his discovery quiet," she falls in with a man who is running for his life from other men who are pursuing him and shooting at him. Acting on the impulse of a moment, she shows him a place where he can hide, and presently "three broad men, with heavy fusils cocked, came up from the sea-mouth of the Dyke, steadily panting, and running steadily with a long enduring stride. Behind them a tall, bony man, with a cutlass, was swinging it high in the air, and limping, and swearing with great velocity. 'Coast-riders,' thought Mary, and he a free-trader! Four against one is cowardice.'" With feminine skill she puts the revenue men off the scent, and then exchanges a few words with the smuggler, in the course of which the reader will observe a curious instance of the impossible whimsicality in which the author sometimes indulges. He begs her to pick up for him, if she chances upon it in her ride, the fellow to a curious and handsome ring which hangs in one of his ears. It has been shot away and he cannot stay to look for it. "'And they really shot away one of your earrings! Careless, cruel, wasteful men! What could they have been

* *Mary Anerley: a Yorkshire Tale.* By R. D. Blackmore, Author of 'Alice Lorraine.' 3 vols. London: Sampson Low & Co. 1880.

thinking of?' 'They were thinking of getting what is called "blood-money"! One hundred pounds for Robin Lyth. Dead or alive—one hundred pounds.'" When Mary goes on to abuse Carroway, the coastguard captain, Robin Lyth—commonly called the new Robin Hood—replies that Carroway is only doing his duty. "'His life has been in my hands fifty times; but I will never take it. He must be killed sooner or later, because he rushes into everything. But never will it be my doing.'" These words have a dramatic bearing on important events which happen much later on. Readers will no doubt foresee the result of this meeting between Mary and Robin Lyth, but will not be able to foresee the many and curious obstacles which interfere with true love's course. Here we are somewhat puzzled as to the direction in which it is most desirable to guide the reader's attention. The many episodes to which we have referred have all a connexion more or less remote with the fortunes of Robin Lyth, and by consequence of Mary. At the same time each one of them might fairly be called a novel in itself, and might form the subject of a separate review. Perhaps the best plan may be to say something as to the general course of the story, repeating again that every character, however much or little involved in the plot, is drawn with singular and complete care and skill, subject, of course, to the oddities of which mention has been made.

Not long after the events just narrated, Carroway, after an exciting chase, brings, as he says, Robin Lyth in custody before Dr. Upround, rector of Flamborough, Doctor of Divinity and Justice of the Peace. The position is an awkward one for the Doctor, who, like most people in the place, is much attached to Robin, and has known him since he was found, a tiny child in gold-embroidered and gold-buttoned night-clothing, lying on the shore as if he had been dropped from the sky. Fortunately a way out of the difficulty is found at the moment when the prisoner is confronted with the magistrate. "Lieutenant Carroway," the Doctor said, "I greatly fear that you have allowed zeal, my dear sir, to outrun discretion. Robin Lyth is a young, and in many ways highly respected, parishioner of mine. He may have been guilty of casual breaches of the laws concerning importation, laws which fluctuate from year to year, and require deep knowledge of legislation both to observe and to administer. I heartily trust that you may not suffer from having discharged your duty in a manner most truly exemplary, if only the example had been the right one. This gentleman is no more Robin Lyth than I am." This is by no means the narrowest escape which Robin has from the clutches of the conscientious Carroway, whose steadfast pursuit of the smuggler ends, as the sequel shows, badly for both. Among Carroway's men is one with the oddly appropriate name of Cadman, who for various reasons cherishes an undying grudge against his commander. On one occasion Robin is at last fairly trapped in one of his favourite caves by Carroway, who hitherto has been constantly put off the scent by accomplices of the smuggler. Carroway at the entrance of the cave stands up in the bow of his pinnace and cries, "In the name of the King, surrender!" To which Robin answers, "In the name of the devil, splash!" and a scene of wild confusion ensues, in the course of which the gallant Carroway, mad with rage, exclaims, "Their blood be upon their own heads; draw your hangers, and at 'em." "He never spoke another word, but furiously leaping at the smuggler chief, fell back into his own boat and died without a struggle, without a groan. The roar of a gun and the smoke of powder mingled with the watery hubbub, and hushed in a moment all the oaths of conflict." The climax of Robin's misfortunes is that he is suspected of having killed Carroway, and has to go first into hiding and then to fly the country. Retribution, however, overtakes the real author of the crime. A certain Mordacks, an admirably drawn and important character, who is employed to seek out the lost heir of Sir Duncan Yordas, brings the deed home to its perpetrator some time after its commission, in a finely dramatic fashion. He sends one "Nicholas the Fish," a mighty diver, to look for the gun with which the fatal shot was fired in the depths of the sea cave, and, at an appointed moment when Nicholas is completely invisible in the water, a preventive gig, with Carroway's widow sitting in the stern, comes into the cave. Mordacks makes the man a speech in which he recounts the deed and announces its coming discovery and punishment. "I am not eloquent," he says, "I am not a man of words; my motto is strict business. And business with me is a power, not a name. I lift my hand; you wait for half a minute; and then, from the depths of this abyss, arises the gun used in the murder":—

> The men understood about half of this, being honest fellows in the main, and desiring time to put heads together, about the meaning; but one there was, who knew too well that his treacherous sin had found him out. He strove to look like the rest, but felt that his eyes obeyed heart more than brain; and then the widow, who had watched him closely through her black veil, lifted it, and fixed her eyes on his. Deadly terror seized him; and he wished that he had shot himself.
>
> "Stand up, men," the commander shouted; "until we see the end of this. The crime has been laid upon our force. We scorn the charge of such treachery. Stand up, men; and face, like innocent men, whatever can be shewn against you."
>
> The men stood up, and the light of the torches fell upon their faces. All were pale, with fear and wonder; but one was white as death itself. Calling up his dogged courage, and that bitterness of malice, which had made him do the deed, and never yet repent of it, he stood as firmly as the rest; but differed from them in three things. His face wore a smile; he watched one place only; and his breath made a noise, while theirs was held.
>
> Then, from the water, without a word, or sign of any hand that moved it, a long gun rose before John Cadman, and the butt was offered to his hand. He stood, with his arms at his sides, and could not lift them, to do anything. Neither could he speak, nor make defence; but stood, like an image that is fastened by the feet.
>
> "Hand me that," cried the officer sharply; but instead of obeying, the man stared malignantly, and then plunged over the gun into the depth.
>
> Not so, however, did he cheat the hangman; Nicholas caught him (as a water-dog catches a worn-out glove), and gave him to any one that would have him. "Strap him tight," the captain cried, and the men found relief in doing it. At the next jail-delivery he was tried, and the jury did their duty. His execution restored goodwill, and revived that faith in justice, which subsists upon so little food.

For reasons which have been sufficiently explained, we have found it impossible to dwell upon more than a few of the many sides belonging to this remarkable book, the pathetic passages of which are not less striking than the humorous or dramatic touches and descriptions which abound in it.

THE SPEAKER'S COMMENTARY.*

THERE can be no manner of doubt that the last published volume of the *Speaker's Commentary*, comprising the Gospel according to St. John and the Acts, is by far the most valuable and important of the whole series. None of the contributors to this joint work are to be compared, for exegetical skill and for thoroughness of treatment, to Dr. Westcott, the Cambridge Regius Professor of Divinity, who has undertaken the Fourth Gospel. The task has been with him the work of years, and a real labour of love. His monograph on St. John's Gospel is a monument of learning, acuteness, patient toil, and piety. Every one knows how modern criticism has disputed the genuineness of the Fourth Gospel. Dr. Westcott boldly meets the sceptical writers of the new school on their own grounds. Not much more is to be discovered, or to be said, on the points of history or authority, as bearing upon the matter; but the internal evidence to be derived from a minute and unprejudiced study of the original document has now for the first time been brought into court by an orthodox champion, and confronted with the superficial objections and innuendoes of the German neologists and Renan. Dr. Westcott in his Introduction proves to demonstration, in our opinion, these several points—that the author of the Fourth Gospel was a Jew; next, that he was a Palestinian Jew; next, that he was an eyewitness of the scenes which he describes; next, that he was one of the Twelve; and, lastly, that he could have been none other than St. John himself. All this is argued out in great detail, and shown by a prodigious accumulation of minute touches, allusions, and inferences in the sacred text. Of course we cannot give even a specimen of this searching investigation. We invite any persons who are concerned in the inquiry to make early acquaintance with Dr. Westcott's essay. We would instance, however, the section on the exact topographical knowledge displayed by the author of the Fourth Gospel both of Jerusalem itself, and of the Temple in particular, as peculiarly convincing. "No creative genius," says Dr. Westcott, "can create a lost site." Jerusalem had been destroyed, it will be remembered, before St. John's Gospel was written; and the later the date to which modern sceptics defer its composition, the stronger becomes Dr. Westcott's argument. We may note here, as a single illustration of this personal knowledge of places and circumstances the very interesting discussion on our Saviour's declaration that He was the "Light of the World," in the eighth chapter of this Gospel. Dr. Westcott considers that the discourse was directly suggested by the lighting of the great golden candelabra, at the Feast of Tabernacles, in the Court of the Women, where, as is clear from a later verse of the same chapter, our Saviour was then teaching. He points out that the Evangelist, whoever he was, must have been personally acquainted with the Herodian temple and the Jewish ritual.

Dr. Westcott pursues his examination of St. John's claims to be the author of the Gospel which bears his name by marshalling the direct internal evidence, and also the external evidence, of the fact. Then he discusses, with the same fulness and the same patient aggregation of minute details, the occasion and date of the Gospel, its object, its plan, and its style. Next follows a chapter on the characteristics of the Gospel, describing its relation to the Old Testament and the gradual unfolding of the Messianic idea. This self-revelation of the Lord carries with it of necessity the development of the personal characters of the men among whom he moved. Accordingly, St. John's Gospel is far richer in distinct types of faith and of unbelief than those of the Synoptists. Dr. Westcott shows great penetration in his explanation of St. John's pictures of Caiaphas and Pilate. It is to St. John, too, that we owe almost all that we know of the personal characters of the Apostles and others who believed. Nathanael and Nicodemus, Andrew, Philip, and Thomas, the woman of Samaria, St. Mary Magdalene, and "the disciple whom Jesus loved" himself, are known to us in their individual characteristics from the Fourth Gospel. Witness the remarkable account given by Dr. Westcott of St. Philip the Apostle. He quotes the tradition preserved by Clemens Alexandrinus that it was Philip who was so severely reproved by his Master for wishing to "go and bury his father." Philip "appears to hang back, to calculate, to rest on others." "Jesus [we read] *findeth* Philip." The Apostle had not himself come to the Great Teacher. But these words seem to

* *The Holy Bible; with an Explanatory and Critical Commentary.* Edited by F. C. Cook, M.A., Canon of Exeter. New Testament. Vol. II. St. John—The Acts of the Apostles. London: John Murray. 1880.

imply "that he was ready to welcome, or even waiting for, the call which was first spoken to him." Dr. Westcott sums up a most interesting contrast with the words: "Philip believed without confidence, Thomas believed without hope." We may here make room for this admirable quotation:—

This fulness of characteristic life in the Fourth Gospel is particularly decisive as to its apostolical authorship. Those who are familiar with the Christian literature of the second century will know how inconceivable it is that any Christian teacher could have imagined or presented as the author of the Fourth Gospel has done the generation in which the Lord moved. The hopes, the passions, the rivalries, the opinions, by which his contemporaries were swayed had passed away, or become embodied in new shapes. A great dramatist could scarcely have called them back in such narrow limits as the record allows. Direct knowledge illuminated by experience and insight, which are the human condition of the historian's inspiration, offers the only adequate explanation of the dramatic power of the Gospel.

The relation of the Fourth Gospel to the Synoptists is treated, next in order, with no less thoughtfulness or completeness than the discussions which preceded it. And then follow two sections on the relation of St. John's Gospel to the Apocalypse and to the Epistles which bear his name. Finally, the text of the Gospel is considered in a most scholarlike essay. Dr. Westcott tells us that there are in existence fourteen uncial and more than six hundred cursive MSS. of St. John. No existing MS. of the New Testament is older than the fourth century. Dr. Westcott claims for the Codex Vaticanus (B) the highest rank among the original authorities for the text. He considers it to represent the text preserved in the Apostolic Greek Church of Rome. The Codex Sinaiticus (א), on the contrary, and the Codex Bezae (D)—the latter the great treasure of the Cambridge University Library—represent a text of great antiquity, probably of the second century, and of Palestinian origin. The final section of this noble Introduction is by no means the least valuable or remarkable. It enumerates and criticizes the commentators on St. John. In this list Dr. Westcott does full justice to Rupert of Deutz and to Johannes Scotus Erigena among mediæval interpreters, and to Godet and Keim among moderns. He attributes, however, to the living voice of Cambridge friends during the twenty-five years of work expended on St. John's Gospel more help than any books could afford him. We note the sound wisdom with which he commends to more attention than they usually receive the renderings of the Latin Vulgate. "It seems to me," he says, "that we have lost in every way from our neglect of a Version which has influenced the Theology of the West more profoundly than we know." Finally, we may observe that Dr. Westcott's annotation of the text of the Fourth Gospel is more copious than that of most of his compeers. His theology is markedly moderate, but is neither latitudinarian nor "broad" in its sympathies. Many of the "additional notes" at the end of certain chapters are extremely valuable, and display most extensive and varied learning. We can but wish that the learned Professor, instead of confining himself to this single book, had had time to complete a commentary on the whole of the Sacred Scriptures.

Full two-thirds of the volume now before us are filled by Dr. Westcott's commentary on St. John. The remaining third is devoted to the Acts of the Apostles. The treatment of this most important book seems jejune and inadequate when compared with the more brilliant work of the Cambridge Professor. The general editor, Canon F. C. Cook, has contributed the introductory matter to the Acts, and Bishop Jacobson, of Chester, supplies the notes. The latter are generally apt, lucid, and succinct. But they lack spirit, and leave many points of interest unnoticed. Acts i. 3 may be considered a crucial test of exegetical excellence. Upon its proper understanding depends an intelligent estimate of the authority of those unwritten traditions of Church discipline and organization which can be traced with certainty to Apostolical times. If, indeed, the Risen Saviour taught His Apostles, during the period between His Resurrection and Ascension, "the things pertaining to" His visible kingdom, the Church, as St. Luke expressly declares, it follows as an almost certain conclusion that not only such facts as the substitution of the First Day as the weekly festival of Christians for the Sabbath, or Seventh Day, hitherto kept holy by the Jews, but other things, such as the ordinance of Confirmation, the transmission of the several orders of the ministry, and the general outlines, at least, of Christian worship and Christian discipline, must have formed part of such oral teaching. For, it will be remembered, the structure of the Church took shape, and its practical working went on from its earliest days, according to some fixed rules and principles which are nowhere laid down in express terms in the New Testament, for the best possible reason, that the Scriptures of the New Testament are subsequent in date to the original organization of the Church. What more probable, then, than that matters of such extreme importance formed the main subject of the Lord's personal communication to His apostles before His ascension? It was the work of the Holy Spirit to call these things to their memory, and to guide and enlighten the founders of the Christian Church in the practical carrying out of these principles. Bishop Jacobson refers indeed to Bishop Moberly's valuable *Discourses on the Great Forty Days*, in which this great truth is admirably enforced, and also to the famous passage of St. Clement of Rome, in which the substitution of the First Day for the Seventh is expressly stated to have been thus ordained by the Lord Himself. But he scarcely seems to have apprehended the full importance of the significant statement of the writer of the Acts. Still, as a general rule, Bishop Jacobson's notes will be found as satisfactory as they are judicious. He makes a good point in commenting on the well-known mistranslated phrase "such as should be saved" (Acts ii. 47), which has been considered to betray a Calvinistic bias on the part of the authors of the English Version. He acquits them of this *mala fides* by saying that they were "unhappy" in following here the Vulgate rendering, *qui salvi fierent*. He himself rightly translates the τοὺς σωζομένους, "those who were being saved;" adding the comment:—"The participle in the present or imperfect tense expresses not a completed act, but a continuous and progressive state." In a subsequent note on Acts vi. 3, Bishop Jacobson quotes from Derrick's note on Dryden's "Hind and Panther" an explanation of the very curious fact that in some editions of the Authorized Version, notably the fine folio of 1659 and the octavo of 1651, the words, "whom *we* may appoint," are printed, "whom *ye* may appoint," so as to make the ordination of deacons the office of the laity rather than of the episcopacy. Derrick's remark is, "Field is said to have been the first printer of this forgery, and to have received for it 1,500*l.* Be that as it may, it is certainly to be found in several of his editions of the Bible." We think with Bishop Jacobson, in opposition to Dr. Farrar, that the fact of St. Paul having been mistaken at Lycaonia for Mercurius, who "was always represented as vigorous and graceful," is "not favourable to the exaggerated notions of the Apostle's personal appearance which are derived from the legend of Paul and Thecla." Of course there are endless questions for discussion which are suggested by these notes. We will refer to only one more. In the description of the storm in the Mediterranean (Acts xxvii.), our commentator suggests that the lightening the ship by "casting out the wheat into the sea," does not mean, as is generally thought, that the crew threw over their provisions, but that the wheat was the cargo of this Egyptian cornship, which had shifted in the gale, and the discharge of which was necessary for righting as well as relieving the vessel, and enabling it to answer the helm. Corn is still carried in bulk in too many seagoing ships, as the records of shipwrecks so often remind us.

We need only say in conclusion that Canon Cook's Introduction to the Acts is ably and conscientiously done. We note in it a most valuable reference to a passage of St. Clement "now completely known from the MS. lately discovered by the Metropolitan of Serrae, Philotheos Bryennios," in which St. Paul and St. Peter are called, even at that early date, "those two great and most righteous pillars of the Church." This disposes of Renan's ridiculous opinion that an enmity, or even rivalry, between St. Peter and St. Paul divided the Primitive Christians into two hostile camps. We can only wish that the two remaining volumes of the *Speaker's Commentary* still to be published may be worthy of the one which we have now noticed.

NEW SCHOOL BOOKS.*

THE first of the three books before us, the *Manual of English Composition*, is one of Dr. William Smith's Educational Course, an excellent series of school books, the useful qualities of which have led to their approval and adoption by practical teachers skilled and experienced in their profession. This new volume is well fitted to keep up the reputation of the series. The subject the author has had to deal with is no doubt a difficult one. The art of writing readable prose has been mastered by so few among English authors that one is tempted to look upon it as a heaven-sent gift, bestowed rarely, and we might almost say capriciously, on some favoured child of fortune who in the opinion of his fellows has no sort of right to expect such favour. Confirmation of this view of the matter we find in the writings of Goldsmith, of Charles Lamb, and of Miss Austen. They all three wrote prose which will charm all readers as long as the English language lasts; yet no one of them achieved it by following a preparatory course of study in the art of composition, or by adhering to any set rules of style. Each took to writing, as it were, by chance, without any special training; and though all three attained the first rank of excellence among English prose writers, their lives were originally cast in lines so entirely apart from all literary influences that their excellence seems almost marvellous. Now, if an Irish ne'er-do-weel who had passed his youth in random rambling, and had taken up one profession after another without success, a London clerk whose days were doomed to drudgery at a desk, and a young lady brought up in the seclusion of a country rectory could write English better than numbers of men of unquestioned powers who have made the art of writing English the study of their lives, it does not seem that the art is attainable by study or can be learned from a manual. Indeed it is a significant and depressing fact that, in spite of the vast number of manuals of English grammar and English composition that have been written for the improvement of the present generation, the quality of the English commonly spoken and written, instead of improving, grows daily worse and worse. The distressing deficiencies of grammar and of style in the works of the most popular novelists are pointed out in vain by candid critics. Their books are still eagerly bought and read to an extent that proves how large a proportion of the English nation are as ignorant as the authors or authoresses of these works in

Geography for Little Children. By Antonia Zimmern. London: E. Stanford. 1880.

which they take delight. And as we notice that the higher the social rank of the readers who patronize this circulating library literature, the worse the grammar gets in the pages prepared for their perusal, we are driven to the conclusion that society has so long indulged in slipshod slang that its members can no longer understand any other language. Even ladies who write for the edification of the nursery and schoolroom dare not be grammatical, for fear of being scouted on a charge of pedantry by the youthful public whose good opinion it is their aim to win. This lamentable indifference to and ignorance of their own language, so prevalent among the highest class of Englishmen and women, is in great part due to the pernicious practice of entrusting the primary education of both boys and girls to foreigners whose chief qualification generally is ignorance of English. The fond mother who confides her darlings to a teacher who "can't speak a word of English" imagines that she is securing for them the envied fluency in French and German that she herself has never been able to attain to. The result is that the children—who are told, poor things, that they must speak languages they don't understand—invent a mixed jargon of French and English, and get so confused in their ideas that they become incapable of writing a grammatical sentence in either. It is to this system of teaching little boys foreign languages before they can read or write their own that the large proportion of failures in spelling among the candidates who present themselves for every sort of examination may be ascribed. The English is the only nation in Europe which thinks its own language unworthy of being taught. The French and the Germans both bestow much pains in teaching the niceties of their mother-tongues, while with us "English in all its branches" is considered as the least important part of the school course, and the time bestowed upon it is too often looked upon as wasted.

Although no text-book, however well put together, can endow dull minds with the power of writing readable books, such a book can at least give even the dullest an amount of knowledge sufficient to enable them to express themselves grammatically in conversation and by letter. Even this amount of excellence, small though it may seem, few persons can attain to without being taught. The publication of *A Manual of English Composition* in a series which has hitherto been chiefly devoted to the classics we hail as a sign that schoolmasters are awaking to the consciousness that it is just as necessary to teach the average schoolboy how to string sentences together in English as in Latin. It is this art of stringing sentences together, in which the sense shall be plain and the grammar faultless, that Mr. Hall's manual professes to impart; and it is well calculated for doing so. The exercises begin with simple assertions, such as that the "fire of London happened in 1666," and lead the learner steadily on until he is supposed to be capable of dealing with such difficult subjects as the "nature of Protection," or the "present political state of Europe." But before he arrives at this pitch of perfection he is taught much that is very salutary as to what he must do and what he must not do with his pronouns, his participles, and his subjunctive moods, when it is fit and proper to adorn his page with figures of speech, and when he must totally abstain from doing so. Happily Mr. Hall is generally in favour of abstaining from figurative and flowery language. In his very first page he urges the student to call things by their right names, and thus cautions him against the use of ornamental synonyms as a refuge against dulness:—

This kind of tinsel adornment pleases none except persons of wholly uncultivated taste, and should be scrupulously avoided.

As a general rule, the student will do well to banish for the present all thought of ornament or elegance, and to aim only at expressing himself plainly and clearly. The best ornament is always that which comes unsought. Let him not beat about the bush, but go straight to the point. Let him remember that what is written is meant to be read; that time is short; and that—other things being equal—the fewer words the better.

In another passage he explains that, if a synonym be used at all, "there should be some appropriateness about it in reference to the place where it is introduced." The result of disregarding this rule is often absurd in the extreme. The abuse of synonyms in most cases springs from the old-fashioned notion, still clung to in most manuals of English grammar, that it is certainly inelegant, if not positively incorrect, to repeat the same word in one sentence. Mr. Hall sees the folly of this, and points out that the best word to express an object or idea, if that object or idea has to be named again, ought to be fearlessly repeated, instead of being displaced by a worse word which does not so happily express the thing intended. Since Macaulay showed the force that lies in reiteration, many writers of repute have had recourse to it; but we never before met with a school-book in which it was tolerated, much less openly vindicated. Mr. Hall thus commends the practice:—

Repetition is a far less serious fault than obscurity. Young writers are often unduly afraid of repeating the same word, and require to be reminded that it is always better to use the right word over again, than to replace it by a wrong one:—and a word which is liable to be misunderstood is a wrong one. A frank repetition of a word has even sometimes a kind of charm—as bearing the stamp of *truth*, the foundation of all excellence of style.

And, again, in another passage he explains how "a vigorous writer has no weak dread of repetition. Repetition is only bad when it arises from poverty of language; and when it is used by definite purpose of the writer it carries force and emphasis with it."

Mr. Hall does not teach by precept alone; he has also recourse to warning and example, and for this end he illustrates and enforces his rules by sentences taken from various authors. Indeed, in turning over his pages the reader is startled to find how many writers, received as unquestionable authorities, he finds tripping in their grammar. The usual defects in the passages quoted spring from careless use of personal pronouns or a haziness as to relatives and their antecedents. However, when we find the *Spectator* among the defaulters, we are inclined to think that any rule which he transgressed was more "honoured in the breach than in the observance." Nor do we see that, in one at least of the passages quoted, Mr. Hall's amendment can be considered either a correction or improvement. The *Spectator* writes:—

At the lower end of the hall is a large otter's skin stuffed with hay which his [Sir Roger's] mother ordered to be hung up in that manner, and the knight looks upon it with great satisfaction, because it seems *he* was but nine years old when *his* dog killed *him*. (Addison, *Spectator*, No. 115.)

This undoubtedly awkward sentence Mr. Hall corrects thus:—

. . the knight looks upon it with great satisfaction, because, it seems, the otter was killed by his own dog when he was but nine years old.

But has he even yet made it clear that it was the knight who was nine years old when this important event took place? We think not. The sentence now seems as if the dog had been nine years old, and yet the rhythm of it is destroyed. Mr. Hall, indeed, does not lay sufficient stress on this quality of rhythm, though therein lies the chief charm of prose. Its presence is the subtle something that carries the reader along in spite of himself, though it is as impossible to define its nature as it would be to explain why a favourite melody or a delicious scent awakens within us feelings of delight. This faculty of writing musical prose seems to be a sort of instinct which no teaching can ever implant; but without it no one, however great may be his powers, will ever become a popular writer.

We note with pleasure that Mr. Hall devotes a chapter to warning all persons, whether young or old, against the use of

many conventional expressions, partly common-place and partly vulgar, which should be carefully avoided. Among these may be mentioned—"individual" for *person*, "residence" for *house*, "locality" for *place*, "parties" or "individuals" for *person*, or *men* and *women*, to "commence" to do anything, for to *begin*, to "go in" for any pursuit or study, "first-class" or "first-rate" for *excellent* (still lower are such phrases as "A 1," "top of the tree," &c.), to "transmogrify" for to *transform*.

Among these "vulgarisms" he very properly classes those scraps of foreign tongues with which half-educated persons are wont to interlard their talk, the pleonastic use of "got" after the verb "to have," and other errors of a like sort arising from lack either of knowledge or of thought. He might have added a caution against that commonest of all vulgar blunders, the practice of calling all the relatives of a reigning sovereign "royalties." Now "royalty," as an abstract noun," has no plural form. The plural "royalties" can only be correctly used to signify certain proportions of the profits of mines or of books assigned to some particular persons. To use the term "royalties" when we mean princes or princesses is just as absurd as it would be to style a bishop's family "episcopacies," or the children of the president of a republic "presidencies." Mr. Hall's manual is certainly the most sensible and practical book upon English composition that we have lately seen. The great variety of subjects which it suggests as themes for exercising the imagination as well as the literary powers of young students will be found a great assistance to teachers, who must often be sorely puzzled to hit upon subjects sufficiently diversified without being ridiculously beyond the scope of youthful experience.

The *Primer of the Industrial Geography of France* is one of a series of educational primers published by Messrs. Sonnenschein and Allen. It dwells in detail upon the natural productions of France in connexion with the manufactures and industries to which they give rise. The money made by the several trades, and the number of persons employed in them, are also stated. The last chapter of the Primer contains an alphabetical list of the departments, enumerating the towns they contain, with the name of the industry chiefly followed in each town and department written opposite to it. Our space does not permit us to examine into the accuracy of each of those items of information, but, turning to the description of the Alpes Maritimes, we note with surprise that Vallauris, which has certainly won a small celebrity from the productions of its potteries, is altogether left out; nor is it to be found in the chapter devoted to pottery and porcelain. Yet the Vallauris ware is perhaps better known out of France than any other ware of French production. There is also no mention of the fruit preserving which is one of the distinctive industries of the department. Nearly all the crystallized fruits which are exported from France are prepared in the "confiseries" of Grasse. It is at Grasse, too, and not at Cannes, that the "parfumeries," where the perfumers of London and Paris distil their sweet waters, are to be found. Turning to another district, the Hautes Pyrénées, we find "Bagnères-de-Bigorre" erroneously written "Bagnes de Bigorres," while its productions and industries are set down as "baths and mineral waters." Now, although it certainly has both baths and mineral waters, yet, as that is an advantage shared by all the towns in the Pyrénées, it would have been more characteristic of the place to name as its industries the marble-cutting works, which are the largest in the South of France, and the wonderful knitted garments of all sorts, made of Pyrenean wool, which the inhabitants consider the *industrie du pays*.

The pages of this primer are too thickly crammed with names and numbers to make it usable as anything but a book of reference. A small commercial dictionary would have been a more suitable

title than the one it bears; for as geography is a science treating of the surface of the earth, we do not see how a little book devoted to an examination of the use man makes of the earth's productions can with reason be called a primer of geography.

Miss Zimmern's little book also belongs to a series, the "London Geographical Series," of which as yet it seems to be the sole representative. It is intended for very young children, and aims at nothing more than teaching them the nature of maps and globes and some few elementary facts of physical geography. In a chapter treating of political divisions there are some strange statements about the cave-dwellers having gradually become civilized into the modern English, and also an erroneous use of the name England to signify the country in prehistoric times. The assertions, too, that the "Saxons ruled in England a thousand years ago," and that "a share or shire of the land was often given to one man to govern, and this man was generally called an Earl," are inaccurate and misleading. Surely the explanation that "political divisions" are "any parts into which people agree to mark out their country," can apply only to the United States, to some of our own colonies, and to France cut up into Departments; for in all other countries, at least in Europe, the political divisions are the result of gradual growth, and their names form the most trustworthy record of the country's history. It seems so difficult to bring home to grown people the historical nature of political geography, that the greatest pains should be taken to accustom children from the beginning to look at the geographical divisions from the historical point of view. But for the seeds of error which we have pointed out, this little book might be both useful and attractive to young children, as the language is simple, the type large and clear, while the pages are enlivened by some good maps and many illustrations. These, we are sure, cannot fail to prove very winning to all such little folk as the "*Dolly, Fantie, and Too-Too*" to whom this little volume is dedicated.

OLD CELTIC ROMANCES.*

THIS charming volume of Irish tales has made its appearance just in the nick of time, when the lucubrations of Professor Sophus Bugge have once more brought the subject of the origin of the Eddic literature of Scandinavia vividly before the learned. It is too soon to guess to what extent the Western Gael will turn out to have left his impress on the tales of the Norseman, but it is not a little gained that we now know that the word *Edda* itself is purely Gaelic. But, as it is our intention to deal with Irish rather than Norse literature, we proceed to give our readers an idea of the plan of this volume and the motives the author had in publishing it. In the preface he speaks as follows:—

> The volume I now offer to the notice of the public contains eleven tales, selected and translated from the manuscripts of Trinity College and of the Royal Irish Academy. Some have been already published, with original text and *literal* translation, and are to be found in the Transactions of various literary societies, where, however, they are inaccessible to the general run of readers; and, even if they were accessible, they are almost unreadable, the translations having been executed, not for literary, but for linguistic purposes. Others have never been translated or given to the public in any shape or form till now. Of the whole collection of eleven tales, therefore, it may be said that they are quite new to the general mass of the reading public. And, furthermore, this is the first collection of the old Gaelic prose romances that has ever been published in fair English translation. Scraps and fragments of some of these tales have been given to the world in popular publications by writers who, not being able to read the originals, took their information from printed books in the English language. But I am forced to say that many of these specimens have been presented in a very unfavourable and unjust light—distorted to make them look *funny*, and their characters debased to the mere modern conventional stage Irishman. There is none of this silly and odious vulgarity in the originals of these fine old tales, which are high and dignified in tone and feeling, quite as much so as the old romantic tales of Greece and Rome.

The author goes on to say that a translation may either follow the very words, or reproduce the life and spirit, of the original, but that no translation can do both; for if one renders word for word, the spirit is lost; whereas, if, on the other hand, the spirit and manner are to be given, one is forced to depart from the exact words, and to frame one's own phrases. Dr. Joyce has chosen to do the latter, and we believe him to have succeeded in rendering the originals, the style of which is generally simple, into simple and homely English, which will be found to add considerably to the charm of the collection. Having said thus much, perhaps we ought to stop, as we feel that we have finished our review; but we may venture to add a few miscellaneous remarks on some of the tales themselves.

In the first tale in the book, "The Fate of the Children of Lir," who are converted by a wicked stepmother into swans, and doomed to exist in that form for nine hundred years, until, in fact, they were to resume the human shape on hearing the bell of St. Patrick, we come across one of the common tricks of Irish legends, that of extending the life of a legendary character down to Christian times. The same occurs in another of these stories in the case of the mermaid Liban, who, after wandering three centuries in the world of waters, dies a good Christian virgin. Other instances, such as the story of St. Caillin's life, might be mentioned of this easy method of bridging over periods the history of which is a blank, and of introducing stories of Pagan times. But none of the instances in which this method has been resorted to has, so far as we know, come near the story of the Ghost-Chariot of Cuchulainn in the Book of the Dun Cow, a venerable Irish manuscript of the end of the eleventh century. There Cuchulainn is not made, it is true, to live at the time of St. Patrick, but he is forced by the Saint to appear in the array in which the shanachies were wont to describe him, in order to satisfy the Irish King, Loegaire, who refused to be converted by St. Patrick's preaching until he had seen Cuchulainn careering over the plain, which all serves to introduce a description of the chariot and the story of the hero's experiences in this life and elsewhere.

The way in which the Celtic storytellers seem to have strung their tales together was generally very simple; one favourite method reminds one of the Labours of Hercules—the hero or heroes are compelled to take part in a number of dangerous adventures in order to attain a certain object. In the Welsh Mabinogion we have an elaborate instance of this, in the story of Culhwch and Olwen, where Culhwch, who is in love with Olwen, can make her his wife only when he has procured her father a large number of apparent impossibilities, and engaged in all kinds of contests, the very mention of which was expected to make him break his heart. Dr. Joyce's book gives us a good specimen of the same method in the story of the Children of Turenn. The latter, having killed one of the Tuatha Dé Danann, find themselves ultimately forced to pay his son the eric due for his father's death, and they allow themselves to be outwitted by him, so that he is enabled to define what the eric is to be. At first they thought it a mere trifle, but they soon found out that it involved them in all kinds of hardships and difficult expeditions intended to effect their ruin, the shanachie of course taking care that that did not happen before his story was of the length he desired. An equally easy method of connecting a number of strange adventures is to suppose the hero to go on a voyage and to land in as many strange islands as the storyteller has strange things to relate. The book before us contains one of these voyages, and the hero's name is Maildun. He sets out in search of a fleet of plunderers who had landed in the West of Ireland and killed his father. This story, which is published now for the first time, is very amusing in parts, and gives an account of the adventures of Maildun and his crew, and of the wonderful things they saw during their voyage of three years and seven months, in their curragh, on the Western Sea. The tale is of the same type as the Voyage of St. Brendan, which was at one time known over most of Europe; an imperfect version of the former is given in the Book of the Dun Cow. The items in this story have little to do with one another, and it may here be mentioned that we have met with one at least of them in the Mabinogion; we refer to the "Island that Dyed Black and White," where, among other things, there was "a very large man," we are told, "employed in dividing and arranging the sheep; and he often took up a sheep and threw it with much ease over the wall from one side to the other. When he threw over a white sheep among the black ones, it became black immediately; and, in like manner, when he threw a black sheep over, it was instantly changed to white." With this compare the following passage from the story of Peredur—we give it in the words of Lady Charlotte Guest's translation:—"And he came towards a valley, through which ran a river; and the borders of the valley were wooded, and on each side of the river were level meadows. And on one side of the river he saw a flock of white sheep, and on the other a flock of black sheep. And whenever one of the white sheep bleated, one of the black sheep would cross over and become white; and when one of the black sheep bleated, one of the white sheep would cross over and become black." We give this coincidence because the passages are, as it were, without context either in the Irish or the Welsh legend, and we could wish to add to it another from the story of the Gilla Dacker, which is also translated into English now for the first time, and is certainly one of the most interesting in the collection. But it would take up too much space, and we shall content ourselves with merely indicating that the wizard-champion at the well, who instantly appears on the spot in full armour and intense rage when the drinking-horn has been taken down and water from the well drunk out of it, may be compared with the well-champion who is roused to action in a somewhat similar fashion in the story of the Lady of the Fountain. But such coincidences as these are trifling and of no great importance as compared with the deeper and broader veins of imagination and myth which penetrate Irish and Welsh romance in common; but that is just the reason why we cannot enter on the discussion of them here.

For the sake of those who imagine that Finn and Ossian belong exclusively to the Scotch Gael, we may remark that, out of the eleven tales in this book, no fewer than six belong to that class of literature which some term Ossianic, but which the Irish more correctly call Fenian. But we could wish that Finn's men were called Fenians, or some other name than Feni, as Dr. Joyce has been tempted to call them. In Irish they are called *fianna*, or champions, whereas the name Feni or Féni has been appropriated in the Brehon Laws of the *Senchus Mór* to what appears to have been a real historical people, the law-giving race of ancient Erin; and it is a pity that their name should be confounded with Finn's champions, who may, after all, have never existed, except as creatures of the imagination. At any rate, we cannot help regarding them as the Goidelic equivalents to Arthur and his Knights among the Brythonic Celts. Just as Arthur and his following appear wherever the Brythons dwell, whether in Great Britain or in Little Britain, so Finn and his Fenians are at home in both the Scotias. The principal difference between the Knights of the Round Table, on the one hand, and Finn and his men, on the other, may be ex-

* *Old Celtic Romances.* Translated from the Gaelic by P. W. Joyce, LL.D., T.C.D.; M.R.I.A. London: C. Kegan Paul & Co. 1879.

pressed in very few words. Arthur and his men had to don the garb and manners of Christian knights in the ages of chivalry, while Finn and his have been allowed to appear in the attire in which a ruder state of society thought fit to clothe them.

MEMOIRS OF A CYNIC.*

IT is not often that we give way to a feeling of despair as we are reading a book. We have never tried Guicciardini, it is true; but yet we have little sympathy with the criminal who broke down at the war of Pisa and chose the galley instead of the author. Even dulness has its humorous side, and Dogberry was not so far out when he offered to bestow all his tediousness on his worship. If Francis had only once in his life cried out "Anon, anon, Sir," there would have been no jest in it. When, however, he came to pass year after year in one or two such utterances as this, then he became a great comic character. So it is with authors. There is a kind of absurdity which can only be attained by a large extent of writing. When a writer of this kind has written only a single page he has done nothing to raise a smile. Even by the time that he has reached the end of his first chapter he has scarcely begun to amuse his reader. But when he has gone on in the same inane way for a whole volume, still more when he has filled three volumes, then his merits begin to be seen. A little air is colourless; but, when we get it spread out all round us or high above us, then we find that it is blue. But now and then we come across a book out of which we can get nothing. It is dull in each single page, and it is equally dull when all the pages are considered as one whole. Such a book as this is the despair of the reviewer, and such a book is *The Memoirs of a Cynic*. We had better at once make a clean breast of it. We have not been able to read it all. We broke down at the end of the second volume. We began to read it on a Tuesday evening at about eight of the clock. At a quarter past eight we laid it down and refreshed ourselves by reading a column of advertisements in the *Times*. We took it up once more and read it for just five minutes longer, when we gave it up for that night as a hopeless job. We tried it again after breakfast on Wednesday morning, and once more after lunch on the same day. We hoped, but hoped in vain, that we might find some one hour in the twenty-four when it could be read with some approach to ease. There was but one chance we discovered of getting through it, and that was to take it in as small and as frequent doses as we could. To sit down, in Johnson's words, doggedly to it was impossible. Nature was too strong for us and would assert her power. We went on with it therefore at intervals on Thursday and Friday, and we have thus managed, as we have said, to make our way through the first two volumes. So far we shall be able to guide our readers, but the rest of the journey we must leave them to take for themselves. This method of reviewing is, after all, what some authors would seem to desire. We hear complaints at times that by the analysis of the plot which is given in a review the interest of the story is lost. Mr. Gilbert will not be able to bring this charge against us, for of the end of the story we know nothing. If, however, there is a plot it must have taken its rise and had its development altogether in the third volume. In the two that we have read there is scarcely a trace of one to be discovered.

The Cynic of these Memoirs, according to his own account, is an elderly gentleman who was suddenly moved to retire from active life by reading in an autobiography an answer given by an old officer to Charles V. Having accordingly retired, he found himself "mortally ennuied," and, no doubt, resolved in revenge that the world should be "mortally ennuied" also. He had some ten years before published a work. The newspapers, it seems, had praised "the originality in its design and method of treatment." These criticisms he had unfortunately collected, and one morning—one unhappy morning—his eye fell on them. One paper especially, called "The Cynic," had, it seems, been praised for its originality, hardly any reviewer failing to notice it. We trust that some of these gentlemen are still living, and that to their lot may fall the task of reading these Memoirs, which are entirely due to their ill-judged praise. We could not wish them a more cruel fate. The Cynic was, he tells us, struck with the idea whether he could not publish his own autobiography something on the plan referred to. "The idea then expressed in some half-dozen pages was considered an original one, why, then, should the book be less so?" We cannot answer this question. For all we know, the book is no less an original idea than the idea that was expressed in some half-dozen pages. An idea expressed in some half-dozen pages or in three volumes strikes one, however, as a somewhat curious phrase. Be that as it may, the Cynic at once decided on beginning his autobiography, and determined, after mature deliberation, to divide it into two parts. In the part we have read his experiences of life were "of the gayer description," though "frequently pathetic episodes would mix themselves up with the ridiculous in my earlier years." We have found nothing gay, nothing pathetic, but everywhere an even and unbroken waste of dreary dulness.

The Cynic, according to his own account, has for many years been a writer for the press. He began to write in the old Tory days, before the first Reform Bill, "when it required," he assures us, "no little courage on the part of the press to attack the abuses of the Church alone." We do not know whether the following passage has been culled from his former writings, and is a proof of the great courage of his youth, or whether it remained for many years an original idea not expressed in any number of pages, till happier times have allowed it at last to be put into print:—

> A tacit understanding seemed to exist between it [the Church] and the Law to allow these infamies to be carried on unchallenged. The Law legalized every injustice committed by the Church on condition that it had its share in the patronage; and the Church sanctified and absolved every legal infamy, provided it had for one of its objects the welfare of the Church temporalities; while the Crown stepped in and gave its sanction to both, thus forming a trinity of scandal which could not have been surpassed for bare-faced injustice and wickedness in the worst era of the Roman Catholic Church.

It is always a fortunate thing, when a writer makes an outrageous assertion, if the language in which he gives it forth is ridiculous. To compare the state of England in the days of George IV. with the worst era of the Roman Catholic Church is absurd. It is scarcely less absurd to call the Crown, Church, and Law a trinity of scandal. The Cynic, however, does not at any time weigh his words. He tells us in one passage that a smell of tar which increased in intensity formed a fitting prelude to a bustling scene of boats. In another he writes that an actress "was pantomimically overwhelmed with gratitude." In one place he falls into an error the very opposite of that which is laid to the charge of George III. It is said that the young King, when he was drafting his first speech to Parliament, wrote "I glory in the name of Britain." The Cynic writes, "I considered them collectively as an executive composed of Briton's best, wisest and bravest." A King may well be pardoned if, in the first speech that he has to write, he shows a little ignorance of spelling, but the Cynic has been on the press for full thirty years, and should by this time have learnt to spell the name of the island in which he lives. We can scarcely reproach him with his ignorance of his native language when he writes of reliable glances and talented dancers. *Talented* has at length appeared in large type in the *Times*, and *reliable* we fully expect to see soon follow. The two words generally go hand in hand. To call a performing dog the Thespian brother of a dog that had not learnt to perform, to speak of the animal's canine accomplishments, to describe the twilight in a room as a dim crepuscule, to say that a man had a difficulty in centralizing his thought, is the every-day English that we come across in our newspapers, and so need not excite our surprise. We may wonder, however, why all the people engaged in an Italian opera company are feminine. As among them the Cynic includes the head lamplighter, we do not understand why he should call them *employées*.

When we pass from the manner of the Cynic's Memoirs to the matter, we find no improvement. He describes in the first volume his foreign travels. He began by being a midshipman in the East India Company's service. He is very careful in each case to begin with the very beginning. Nothing is left to the reader's imagination. He got his appointment through a London merchant, to whose house of business he was taken by his guardian. We are told that the merchant's office was in George Court, Lombard Street. It may be admitted that a certain amount of minuteness is needful to give an air of reality to a story. Defoe, the Cynic would probably say, carried minuteness to an extraordinary degree, and see how Defoe is read. We will therefore not be too hard on our author, but will allow that he was justified in telling us that the house of a certain merchant, who at least fifty years ago got him an appointment as midshipman, was situated in George Court, Lombard Street. But here we must draw a line, and put in some little plea for our imagination. Was it needful to go further and tell us that "Mr. Burton's offices themselves consisted of two separate rooms, one marked 'private' for himself, and the other appropriated to two clerks"? Was it needful to add that the Cynic and his uncle were ushered into the private room? Had Mr. Burton proved a talented murderer, had he decoyed the fond youth and his confiding guardian into a darksome den, feebly lighted by a dim crepuscule, had his *employées*, the two clerks, been reliable accomplices in disguise, and had the word "private" been only a prelude to secret assassination, then we could have approved, and more than approved, of the minuteness of the description. But nothing comes of all this. The guardian calmly signs a cheque, and about five minutes afterwards quits the office on his own legs, and not in a sack or a coffin. We shall not follow the Cynic in his adventures at sea, or in his long residence in Italy. We shall content ourselves with pointing out to our readers the accurate minuteness which he shows in this part of his Memoirs also. He arrives at a foreign city, Milan for instance. "Before the time for the *table d'hôte*," he writes, "Lefevre conducted me to the Duomo, and two or three other principal objects in the city, and we returned to the hotel." But we hasten past such occurrences as these to the second volume, when the author has become a theatrical critic. Here he is thrown across more than one of those very wicked noblemen who are to be found, if we may trust our writers, not only on the stage but also behind the scenes. He had, he says, an opportunity of seeing a good deal of the nobleman who "is believed to have served the late Mr. Thackeray as the model for his character of the Earl of Steyne in his novel of *Vanity Fair*." It was, by the way, a Marquis of Steyne, and not an earl. We are glad to find that the Cynic does not think it necessary to be as minute as usual in his account of the wicked deeds of the nobility. He says, "besides the noblemen alluded to, there were many others who made themselves notorious by their profligacy, but of (*sic*)

* *Memoirs of a Cynic*. Edited by William Gilbert, Author of "Shirley Hall Asylum," &c. 3 vols. London: Tinsley Brothers. 1880.

whom, out of respect to the feelings of their descendants, I will not further allude." The sentiment is certainly respectable, though the English in which it is expressed is more than doubtful. In the following page we read that "no greater reformation has taken place among any class in England in their respect for decency and public opinion, as well as in their private lives, than that which now exists between the manners and habits of the present generation and those which were common some forty years ago." Here again our satisfaction in the statement that our author makes is considerably lessened by the difficulty we find in understanding his English. How, we may ask, can a reformation exist between the manners and habits of two generations? While we record the improvement in our nobility, justice will not allow us to pass over the merits of certain ladies of the ballet in days long gone by. Mme. G—— and Mme. B——, we read, led lives so far above scandal "that they were selected as teachers of dancing to the young Princess who was afterwards to be our Queen. It may naturally be imagined," the Cynic goes on to remark, "that neither of them would have been chosen for a duty of the kind had not her reputation been in every sense of the word perfectly irreproachable." We have led our readers from a merchant who had a room marked private to wicked noblemen; from wicked noblemen to reformed noblemen; from them to anonymous but perfectly irreproachable ladies of the ballet; and so onwards and upwards to the young princess who has since become our Queen. We have not exhausted even half the second volume, and we can assure those who like such reading that in the parts that we are forced to leave unnoticed they will find a great deal more quite equal to the passages we have quoted.

AMERICAN LITERATURE.

THE principal work on our present list offers a remarkable contrast to that which was incomparably the most interesting of those we noticed last month—the Memorial volume of the Army of Northern Virginia. This also is in some sense a memorial work. Its size, the style of its execution, the scale on which the minutest and most trivial incidents are recorded, its costliness, and its utter disregard of proportion and of the relative importance of topics, imply that it is to be regarded not as a genuine contribution to American literature, still less as an attempt to meet any real popular demand, but as a mere attempt to glorify a man to whom we hope the glorification must be intensely disagreeable. This record of General Grant's tour round the world, in two ponderous quarto volumes (1), contrasts in every way with the simple, unpretending, and profoundly touching memorial of the army which, by force of numbers alone, General Grant defeated. The tour was a parade, in thorough American taste, of one whom, since Americans so chose to present him, other countries were in a sense bound to receive as the representative of American nationality. The book reminds us not a little of the volumes in which the Shah of Persia has recorded his impressions of European scenes and persons; except, of course, that it utterly lacks the *naïveté* of the Eastern monarch's views of European civilization. It has all the vices of courtiership, with none of the dignity which loyalty and reverence for an ancient title may sometimes give to the subserviency of a Court; all the bunkum and bad taste of American hero-worship, all the pert assumption of superiority, all the endeavour to be funny, attended by signal ill-success, that characterize a certain class of American books of travel. In a word, it is about the very worst book of its size in the world, and will do all that biography can do to render an eminent man ridiculous. How General Grant can have tolerated its publication we are at a loss to conceive. Moreover, there is a great deal more in it of Mr. Russell Young than of General Grant. The courier figures quite as prominently, supplies as much of the real material of the work, as its nominal hero. It is padded with descriptions and engravings—both as a rule bad—of things and persons that have been described over and over again to weariness by American and English writers. The author has carried out in a new form the national idea of grandeur as consisting simply in size, and has carried it out to a point of absurdity never before attained. It is a relief, in the midst of Mr. Young's flippant and meaningless verbiage, to come across the addresses presented by various public bodies, English and other, to the General, which in any other work would be skipped as tedious to the last degree; a still greater relief to read the brief, polite, carefully constructed sentences in which the General studiously contrived, like his panegyrist, to say nothing, but, unlike him, to say nothing in the fewest possible words, and with the least possible offence. Perhaps the greatest merit which General Grant has displayed in civil life, certainly that which has most contributed to his success as a politician, is his signal capacity for holding his tongue. He alone of Presidential candidates does not need to be surrounded by a bodyguard instructed to exclude interviewers and strangers, and to deprive the object of their care of everything that can be converted into writing materials. He has always known how to answer a deputation of his countrymen with all the skill and success, if not with all the affability, that distinguished Lord Palmerston—

> To say nothing without he's compelled to,
> And then to say nothing that he can be held to;

and his merit in this respect must be measured by the persistent inquisitiveness of those with whom he had to deal. It must have been a comparatively easy task for him to answer English mayors, and foreign princes and diplomatists, without saying anything that could possibly be turned to electioneering account beyond the Atlantic. But it is hard upon him that the record of a tour whose object was distinctly negative—to take him for a while from under the eyes of his too observant countrymen, and give them time to forget the President, and remember the conqueror of Virginia—and of speeches whose purpose was equally null, should laboriously defeat his aim. However, it will assuredly not deprive him long of the temporary oblivion he is believed to have sought; for the most impatient New Englander, confined by the heaviest rains in the dullest of country taverns, could not attempt to read more than a few pages of this insufferable narrative of interminable nothings. It is notorious that General Grant has never shown that skill in selecting his personal *entourage* which he must have possessed in choosing lieutenants and assistants in the field, and that he has suffered heavily in character, reputation, and influence, through the sins and blunders of those with whom he has surrounded himself; but perhaps he never made a worse mistake of this kind than when he chose as the journalist of his voyage the author of these two massive volumes, with their eight hundred illustrations.

Mrs. Woolson's "Southern Sketches" (2) are on the whole commendable. They are taken, of course, from a Northern point of view; but there is evidently no intentional injustice, no disposition to colour the scenes and characters of those among whom, soon after the war, she as a Northern visitor received at least as much courtesy and consideration as she could fairly have expected—treatment very different from that which a German lady similarly settling in France after 1870 would have received. Her testimony to the acts of Sherman and others is the more worthy of observation and remembrance because it is incidental and involuntary. The savage atrocities committed by the invaders in South Carolina have been studiously ignored, if not denied, by Federal partisans on this side of the Atlantic; and it is well therefore to have the truth recalled by a few quiet, matter-of-fact descriptions taken down from the lips of eye-witnesses by one whose sympathies evidently go with the destroyer. A tinge of deep melancholy pervades nearly all these papers—sketches, slight as they are, of a ruined people and a ravaged land. But it seems a little strange that Mrs. Woolson should treat the bitterness of Southern women, the resentment of Southern soldiers, as something unreasonably exaggerated and almost unnatural. Evidently she has never tried to ask herself what would have been her own feelings and those of her kindred and countrymen in similar circumstances.

The industrial history of the United States is one of the grandest and, at the same time, most difficult subjects that a writer thoroughly in earnest could undertake; one which, undertaken with clear views of the object to be aimed at, the bounds to be observed, and the proportionate importance of different branches of so great a theme, might achieve for its author a high and permanent place in literature. Unfortunately, though the solid volume of Mr. Albert Bolles (3) contains an immense mass of very valuable information, it has been begun and carried through with so dim a notion in the author's mind of his own real purpose, so poor a conception of what such a work should aim at, that the general result is altogether disappointing. By striking out some two-thirds of the matter he has inserted, the merit of his book would be not a little enhanced, though it would still remain a monument of somewhat elaborate failure. As it is, it is so overloaded with details which would be more in place in the advertising columns of a technical journal, that we fear it will find but few readers, at least on this side of the Atlantic, and will win for its author no credit at all proportioned to the labour it must have cost.

We have before us two works on Health Resorts, their general operation and the particular conditions by which their choice should be governed; the main distinction between the two being the limitation of one of them to a single disease and a single locality. Dr. Denison professes to describe only the health resorts of the great mountain range of North-Western America (4), a favourite region with invalids suffering from that terrible scourge of the English race which seems to be almost more common and more fatal in the United States than in the mother-country. How and why mountain air, and especially the air of the Rocky Mountains, with the desert on the east, the vaporous masses constantly drawn in from the vast water surface of the Pacific on the west, arrested by their higher peaks, should be especially favourable to the recovery of consumptive patients in the earlier stages of the disease, Dr. Denison discusses at some length and with undoubted practical knowledge. One especial peculiarity of the sanitaria of the Far West is that few of them were chosen originally as resorts for valetudinarians. On the contrary, they first attracted men prepared for the hardest labour and the roughest life, chiefly adventurous gold-miners like those who had already spread over

Bolles, Author of "The Conflict between Labour and Capital," &c. Norwich, Conn.: The Henry Bull Publishing Co. London: Trübner & Co. 1879.

(4) *Rocky Mountain Health Resorts: an Analytical Study of High Altitudes in Relation to the Arrest of Chronic Pulmonary Disease.* By C. Denison, A.M., M.D. Boston: Houghton, Osgood, & Co. London: Trübner & Co. 1880.

California; and more than one of the places chiefly recommended to sufferers from pulmonary disease, like Denver, still retain in the character of their society very perceptible traces of their origin. It might perhaps be found on a careful examination of their statistics that till very lately the heaviest loss of human life in that region was not among invalids; that dangers quite as great as consumption itself lay in the fierce tempers of the original population, as yet imperfectly restrained by lax legislation and an unorganised police. Dr. Wilson, with wider knowledge and experience, covers also a wider range, and there is a great deal in his little volume (5) both of local information and of practical suggestion respecting the cases in which change of air is or is not a proper remedy, and the sanitary precautions by which it should be accompanied, which will be as useful to English as to American invalids.

Dr. Belknap's Biographies of the pioneers of Transatlantic discovery (6) won celebrity at the very beginning of this century. They are now reprinted with a fair chance of revived popularity. But since their original publication so much new information on the subject has been acquired, so many documents then unknown have been ferreted out, and such pains have been bestowed on rendering their contents available to the general reader, that we cannot well recommend this volume as in any sense a complete account of what is now known respecting the achievements of the Spanish, French, and English successors of Columbus during two centuries of constant progress, achieved by daring courage and arduous labour, at no little cost of life. Certainly the discoverers of the great lakes, the Mississippi, the Ohio, and the vast ranges of fertile land drained by each of these grand water systems, deserve more honour than they have yet received from the millions who have entered into the fruits of their labour. What those fruits are may be seen at a glance in Mr. Edward Atkinson's chart entitled *Our National Domain* (7).

The collected Reports of the United States Consuls on the state of European labour, the rate of wages, and the temper of the working classes in England and throughout Europe in the year 1878 (8) are, as usual, worthy of attention, containing a quantity of statistical and other information which, so far as we are aware, is not so easily accessible in any other form.

The Report of the Commissioners of the State Survey of New York, on the suggestion—originally emanating, we believe, from Lord Dufferin—that the land around the Falls of Niagara should be acquired by the joint action of the Empire State and the Dominion of Canada (9), and preserved by them as a sort of international pleasure-ground, possesses high interest for all who have seen or hope to see one of the grandest of natural scenes, and who would wish it to be protected against further desecration, and the hideous deformity which greed and bad taste are constantly aggravating. Already hotel-keepers and other speculators in the curiosity of mankind have done much to disfigure the scene. If it should be found possible to utilize the gigantic water-power for manufacturing purposes, we may expect still worse disfigurement. It seems hardly conceivable that the terrific force of the Falls, or even of the rapids, could be tamed to human uses; but American engineering is so well disposed to attempt the gigantic and grotesque, if not the impossible, that such evidence of a disposition to protect the Falls and the surrounding scenery as is given in the volume before us entitles the State Government of New York to a degree of respect and gratitude abroad which we fear it has not always of late enjoyed among its own constituents.

Mr. Bartol has given the title of *Principles and Portraits* (10) to a collection of very long and somewhat incoherent essays on such subjects as Life and Love, Art and Science, Education and Religion, Shakspeare, Channing, and Garrison. They are chiefly remarkable for their sentimental and sensational vehemence, not to say extravagance.

An anonymous volume of essays (11) opening with one on Certain Dangerous Tendencies in American life is more readable, more interesting, and contains more practical truth than many much more pretentious works of a class too common in England, and becoming yet more common in America. The two leading ideas—illustrated more or less directly in nearly all the essays—deserve perhaps more attention than they are likely to obtain. Though the labouring wage-receiving democracy of the United States is better off than the corresponding class in any other country—some of our own colonies, perhaps, excepted—though it has few grievances, practical or political, to complain of, nevertheless the extent of its power and the current opinions under the influence of which it is brought appear to render it not less discontented, while its discontent is much more formidable, than is the case with the working classes of most European countries, France perhaps excepted. The ideas which seem to have found favour with no small proportion of the ablest and most thoughtful immigrants of this class are scarcely less extravagant than those of the Russian Nihilists or the German Socialists, though they are happily unaccompanied by the bloodthirsty violence which characterizes some of their European prototypes. On the other hand, the practical opportunities both of self-elevation and of usefulness to others which are open to men and women of all ranks in the society of the West, where no solid crust of habit and organization constrains individual freedom of thought and action, take away one of the principal excuses for extravagant theorizing and passionate rebellion against existing order, which the social compression of older countries tends in certain minds to produce. Both these facts are not only clearly stated, but illustrated by numerous pointed and very well told instances, in the volume before us.

Mr. Woolsey's History of Communism and Socialism (12) is, as the author modestly calls it, a mere sketch, and the subject is one of which mere sketches are perhaps hardly effective. Most readers who care to enter upon the subject at all are tolerably familiar with the general outlines of the various socialist experiments that have been made in all ages, but in none so largely as during the present century; and Mr. Woolsey has little that is new to tell us about any of them; nor are his general observations, however sensible, particularly novel. The best feature of the book is the temper it displays, steadily true to the sound principles of political economy, while just and even generous to those who by ignorance and by circumstances are naturally tempted to set them at defiance.

Mr. S. J. Watson's little volume on the Powers of Canadian Parliaments (13) is, though interesting, somewhat disappointing. It contains no clear and full account of the general nature of that distribution of authority of which for various reasons the Canadian Federation offers an almost unique example; while it enters at great length into particular questions of only local and provincial interest. The Canadian Constitution is peculiar in this—that it is the Constitution not only of a Federation but of a dependency; and further, that the sovereign of the Dominion is also the sovereign of each of its constituent fractions. This last peculiarity is exhibited in various disputes as to the party entitled to exercise and benefit by the prerogatives of the Crown. The ownership of the Queen over waste lands, escheats, and so forth, being undeniable, the question arises whether that ownership is to be exerted by the Queen as represented by the Lieutenant-Governor of the Province, or by the Queen as represented by the Governor-General; it might conceivably be added, or by the Queen as head of the Imperial Government. But the position of Canada as a dependency of the British Crown has one supreme advantage of which we are glad to see that a Canadian patriot like the author is fully conscious. The Federal idea excludes that of absolute sovereignty either in the Federation or in the Provinces; and in an extreme case there is no last arbitrament but that of the sword. But between the Provinces and the Dominion of Canada there exists an arbitrament in the last resort absolute and supreme—that of the Imperial Crown and Parliament; a power which, unlike the Supreme Court of the United States, can not merely lay down the law, but make it.

Mr. Fowler's account of twenty years spent amid the intense excitement of Wall Street (14) speculation, though somewhat too long and too full of purely technical terms which are never sufficiently explained, is very readable and interesting, often very amusing. As elsewhere, so on the Exchange, American extravagance out-Herods the wildest extravagances of European speculation, and the achievements of the Vanderbilts, Drews, *et hoc genus*, both in their colossal character and in their audacious smartness, are calculated to astound even those familiar with the secrets of European Bourses.

The *Studies of Irving* (15), written in the form of biographical and critical essays by three able contemporaries, will probably find a large number of readers, Washington Irving having been one of those literary men whose personality excites an interest quite as great, if not as lasting, as that attaching to their works.

The selections of American prose (16) for which we are indebted to Messrs. Houghton, Osgood, & Co. are somewhat more successful than is usually the case with such collections, the specimens, taken exclusively from modern writers, being at once interesting in themselves and generally characteristic.

The *Legend of St. Olaf's Kirk* (17), a poem in the form of a pamphlet by Mr. G. Houghton, shows somewhat more of poetic feeling than of critical judgment or power of versification.

DORÉ'S GREAT WORKS, "CHRIST LEAVING the PRÆTORIUM," "CHRIST ENTERING JERUSALEM," and "The BRAZEN SERPENT," each 33 by 22 feet; with "Dream of Pilate's Wife," "Christian Martyrs," &c. at the DORÉ GALLERY, 35 New Bond Street. Daily, Ten to Six. 1s.

GROSVENOR GALLERY SUMMER EXHIBITION NOW OPEN, from Nine till Seven. Admission, 1s. Season Tickets, 5s.

INSTITUTE of PAINTERS in WATER-COLOURS.—The FORTY-SIXTH ANNUAL EXHIBITION is NOW OPEN, from Nine till dusk. Admission, 1s. Catalogue, 6d.
Gallery, 53 Pall Mall. H. F. PHILLIPS, *Secretary.*

LONDON LIBRARY, 12 St. James's Square.—The THIRTY-NINTH ANNUAL GENERAL MEETING of the Members will be held in the Reading-room, on Monday, May 31, at Three o'clock in the afternoon. The Right Hon. the Earl of CARNARVON in the Chair.
By Order of the Committee,
May 10, 1880. ROBT. HARRISON, *Secretary and Librarian.*

CLIFTON COLLEGE.—CLASSICAL, MATHEMATICAL, and NATURAL SCIENCE SCHOLARSHIPS. NINE or more open to COMPETITION at Midsummer 1880, value from £25 to £50 a year, which may be increased from a Special Fund to £90 a year in cases of Scholars who require it.—Further particulars from the HEAD-MASTER or SECRETARY, the College, Clifton, Bristol.

ENTRANCE SCHOLARSHIPS.—TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.—Four, of the value of 30 Guineas per annum, will be open to competition to all BOYS under Fourteen on the day of the Examination (June 29).—Apply to the WARDEN.

ROSSALL SCHOOL.—ENTRANCE SCHOLARSHIPS.—TWELVE to be competed for, June 29. Value, from 70 Guineas (covering School Fees) to £20. Ages, under 14½ and 15½. Candidates may be examined at Rossall or Oxford, as preferred, in Classics or Mathematics.—Apply to Rev. the HEAD-MASTER, Rossall School, Fleetwood.

SHERBORNE SCHOOL.—SEVEN SCHOLARSHIPS will be offered for Competition on July 20.—Apply to the Rev. A. WOOD, Sherborne, Dorset.

SOMERSETSHIRE COLLEGE, BATH.—An EXAMINATION will be held on June 29 and 30, to elect to Seven Entrance Scholarships.—T. M. BROMLEY, M.A., Head-Master.

LEAMINGTON COLLEGE.—There are Three Departments, (1) Classical, (2) Civil and Military, (3) Junior. Honours gained last year include Scholarship at Balliol, Entrances at Woolwich and Cooper's Hill.—Apply to the HEAD-MASTER.

TOURS, FRANCE.—Rev. C. DOWMAN, LL.B. (Mathematical Honours), late Tutor in Nobleman's family, receives PUPILS for Woolwich, Sandhurst, and Line, and Militia, Universities, and for General Education. Able staff of Masters. Individual attention and careful moral supervision. Very successful at late Examinations. Large house and pleasure grounds.—Address, Beau Séjour.

KING ALFRED'S SCHOOL, WANTAGE, Berks.—An Ancient Foundation. Buildings spacious and modern, in a healthy district. Thorough EDUCATION for the SONS of GENTLEMEN. Fees moderate. Boys prepared for Commerce, the Professions, and the Universities.—Address, HEAD-MASTER.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

FOLKESTONE.—MR. W. J. JEAFFRESON, M.A. Oxon., assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities, Sandhurst, Woolwich, the Civil Service, and all Competitive Examinations. A few Vacancies.

PRIVATE PUPILS, ages Fourteen to Eighteen.—Mr. JOHN C. GAWTHERNE, M.A. (Lancing and Oxford) receives a few GENTLEMEN'S SONS who are unable to go to School, and offers to deserving Boys very unusual advantages.—Address, Stifford's Bridge, near Malvern.

PUPILS prepared for the Universities, Army, &c., by Rev. W. M. ROWLANDSON (late Fellow of Corpus Christi College, Cambridge), Great Braxted Rectory, Witham, Essex.

DINARD-LES-BAINS.—BOYS (of any age) requiring Home Care, Sea-Bathing, and an exceptionally Healthy Climate, are received by the Rev. A. F. THOMSON, B.A. Great advantages for French, German, &c.—Address, Maison Henry, Dinard, Ille-et-Vilaine, France.

LONG VACATION TUTORSHIP.—An OXFORD UNDERGRADUATE, the holder of two Exhibitions at his College, and for five years a Scholarship at one of the great Public Schools, is anxious to meet with an ENGAGEMENT for part of the Long Vacation. He has had experience in Coaching Boys between the ages of Twelve and Sixteen; he would not object to a Travelling Tutorship.—Address, W. F., care of Messrs. Sampson Low & Co., 188 Fleet Street, London.

ENGINEERING.—A CIVIL ENGINEER, A.M.I.C.E., actively engaged in one of the Northern centres in designing and carrying out important works in connexion with Iron Bridge-building, general Engineering, and constructional Ironwork, has an opening for an ARTICLED PUPIL. In addition to a sound Theoretical training, he is in a position to offer a Pupil almost unrivalled opportunities of acquiring a thorough knowledge of practical work.—For particulars, amount of premium, &c., address ERA, care of H. BOWES SCOTT, 5 Broadway Chambers, Westminster.

EMPLOYMENT WANTED as CANVASSER, COLLECTOR, or in other Out-of-door Occupation, by a TUTOR, over Thirty, who is looking for an opening in business. Salary to depend entirely upon results of work.—Address, M. A., 32 Luxor Street, Coldharbour Lane, London, S.E.

UNIVERSITY of OTAGO, NEW ZEALAND.—CHAIR of ENGLISH LANGUAGE and LITERATURE, POLITICAL ECONOMY, and CONSTITUTIONAL HISTORY.

A PROFESSOR for this Chair is now WANTED.

The Salary will be £600 per annum (which will commence to run from the date of embarkation), besides the Class Fees, which are £3 3s. for each Student per term of six months, commencing in May of each year. An allowance of £150 will be made for passage money and outfit.

The age of Candidates should not exceed Forty.

No religious test is required to qualify to hold office in the University or to graduate or to hold any advantage or privilege thereof.

The tenure of office shall be during good behaviour, but in case of the successful candidate becoming incapacitated from age or any other circumstance, a substitute *pro tempore* shall be appointed who shall receive half the salary and the whole of the fees.

The University is also fully equipped with Chairs of Classics, Mathematics, and Natural Philosophy, Mental Philosophy, Chemistry, Mining, Anatomy and Physiology, and Biology.

Applications from Candidates, with seven copies of testimonials, must be lodged with GEORGE ANDREW, Esq., S.S.C., 3 Hope Street, Edinburgh; or HUGH AULD, Esq., W.S., 21 Thistle Street, there, on or before May 31 next.

Edinburgh, April 28, 1880.

TO GENTLEMEN Engaged during the Day.—A large, airy SITTING-ROOM and BED-ROOM. Home comforts, cleanliness, and punctuality.—Address, 38 Albion Grove, Barnsbury, N.

TO BE LET, FURNISHED, for a long or short term, a Gentleman's HOUSE, in South Kensington, containing Dining, Drawing, and Breakfast Rooms, Four Bedrooms and Dressing-room, and good Domestic Offices. Rent moderate.—Address, A.B., 38 Southampton Street, Strand, W.C.

ADVOWSON.—TO BE SOLD, an ADVOWSON, within a short distance of a good Cathedral, in one of the Home Counties. Population 500, society good, and the Church and Vicarage in excellent condition. The net annual value is about £600. Age of present Incumbent over Seventy-five.—For particulars apply to Messrs. JOHNSONS, UPTON, BUDD, & ATKEY, Solicitors, 20 Austin Friars, London.

ADDINGTON HILLS, SURREY.—TO BE LET, ON LEASE, COOMBE HOUSE, a Family Mansion, surrounded by its own beautiful Grounds of 42 acres, adorned with stately timber, and choice shrubs of luxuriant growth. The House, which stands on gravel soil, is in excellent repair throughout, fitted with gas and modern conveniences, and contains four handsome reception rooms on the ground floor; Billiard room, and sixteen Bedrooms on the first and second floors, and all the necessary accommodation for a family of position. There is Stabling for eleven horses and extensive Coachhouses, large walled Kitchen Gardens, Farmyard, Laundries, Conservatory, Greenhouses, &c. Rent £500 per annum. The fixtures, plants, and outdoor effects to be taken by valuation. For further particulars and cards to view, apply to BLAKE, SON, & HADDOCK; Auctioneers and Estate Agents; 32 Nicholas Lane, Lombard Street, E.C., or to Messrs. DEBENHAM, TEWSON, & FARMER, Estate Agents, 80 Cheapside, E.C.

THE LAND and MORTGAGE COMPANY of EGYPT, LIMITED.

NOTICE is hereby given that the SHARE CERTIFICATES are now ready for delivery in exchange for the Banker's Receipts and Letters of Allotment.

27 Clement's Lane, Lombard Street, E.C. O. FOA, *Secretary.*
May 27, 1880.

EGYPTIAN STATE DOMAINES.—The Administration of the State Domaines, composed of an English, a French, and an Egyptian Commissioner nominated by their respective Governments, is disposed to LET or to SELL LAND, in Lots of not less than 500 Acres.

The Domaines comprise 425,000 acres of land in different parts of Egypt. They are in cultivation at the present time, and the plant and cattle necessary to continue the cultivation could be acquired at a valuation.

A statement of particulars and general conditions can be had on application between the hours of Ten and Four, at the office of Mr. J. W. BARRY, 23 Delahay Street, Westminster. Further particulars can be had on application to the PRESIDENT of the Egyptian State Domaines, Cairo, to whom proposals for purchase or lease should be addressed.

FRANCIS W. ROWSELL, EDOUARD BOUTERON, ROUSTEM (Pacha). } Commissioners of the State Domaines.

Cairo, May 21, 1880.

ENGLAND to AUSTRALIA in FORTY DAYS.
ORIENT LINE.

The following Royal Mail Steam Ships, belonging to the ORIENT and PACIFIC STEAM NAVIGATION COMPANIES, are despatched every FORTNIGHT for ADELAIDE (Semaphore), MELBOURNE, and SYDNEY direct, taking Passengers at through rates to all the principal ports in Australia, Tasmania, and New Zealand.

	Tons.	H.P.		Tons.	H.P.
ACONCAGUA	4,107	600	LIGURIA	4,666	750
CHIMBORAZO	3,847	550	LUSITANIA	3,825	550
COTOPAXI	4,028	600	ORIENT	5,386	1,000
CUZCO	3,845	550	POTOSI	4,219	600
GARONNE	3,876	550	SORATA	4,014	600
JOHN ELDER	4,152	550			

The above Steamers have been specially fitted for carrying all classes of passengers through the Tropics on long voyages, and the passages hitherto made are the fastest on record.

Fares from 14 Guineas upwards.

For further particulars apply to the Managers of the Line, F. GREEN & CO., and ANDERSON, ANDERSON, & CO., Fenchurch Avenue, London, E.C.

PENINSULAR and ORIENTAL STEAM NAVIGATION COMPANY.

UNDER CONTRACT FOR HER MAJESTY'S MAILS TO INDIA, CHINA, AUSTRALIA, &c.

REDUCED RATES OF PASSAGE MONEY.—SPECIAL RETURN TICKETS.

Weekly departure for .... Bombay.
Fortnightly departure for.............. Ceylon, Madras and Calcutta.
Fortnightly departure for.............. China and Japan.
Fortnightly departure for.............. Australia and New Zealand.

OFFICES: 122 LEADENHALL STREET, LONDON, E.C., and 25 COCKSPUR STREET, S.W.

HOTELS.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.
BENJN. BULL, *Manager.*

THE ILFRACOMBE HOTEL is on the Sea Shore. It contains 250 Rooms, and is "a model of sanitary excellence." Table-d'hôte daily. Two Months' Tourist Tickets from all principal Railway Stations in England.—Full information of MANAGER.

TOTLAND BAY, ISLE OF WIGHT, NEAR ALUM BAY.

TOTLAND BAY HOTEL.—Magnificent Sea Views. Comfort with moderate charges. Billiard-room and Tennis-lawn. Bracing air; excellent sands and promenade Pier. Good anchorage for yachts. Apply to Miss FLEMING, Manageress, late of the Langham Hotel.

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 1,285, Vol. 49. June 12, 1880. [Registered for Transmission abroad.] Price 6d.

THE NEW BUDGET.

MR. GLADSTONE has lost no time in justifying his assumption of the office of Chancellor of the Exchequer. He has brought in a new Budget characterized by the boldness which has always marked his Budgets, and explained and defended in one of those masterly statements which no one but Mr. GLADSTONE could have offered to Parliament. It is many years since the House of Commons has had the opportunity of enjoying so great an intellectual treat. Novelties assumed the air of indisputable truths, and complicated figures were woven into the thread of an easy and intelligible narrative, in a manner new to this generation, and reminding the older members of the House of the days when Mr. GLADSTONE first soared above the level of ordinary financiers. In two hours Mr. GLADSTONE re-arranged the wine duties, abolished the Malt-tax, put a heavy penalty on the publicans, and added a penny to the Income-tax. The negotiations for a new treaty with France afforded an opportunity for dealing with wine. Agricultural distress furnished a motive for relieving farmers from a burden of which they have been complaining helplessly and hopelessly time out of mind. The indignation excited by the violence and arrogance of the publicans during the recent elections imparted a peculiar attraction to a proposal for making publicans pay; and even the unwelcome addition to the Income-tax was sweetened by the explanation that it was made for a purely temporary purpose, and was merely a contribution by means of which a great advance towards perfect freedom of trade was to be purchased. As the crown of his work, Mr. GLADSTONE sought to establish something like a real surplus. Sir STAFFORD NORTHCOTE had been content with a modest surplus of 184,000*l.* But this surplus is already non-existent. It has been swallowed up, and more than swallowed up, by supplementary estimates which reach 200,000*l.* If all the great and various changes contemplated by Mr. GLADSTONE are adopted by Parliament, he calculates on having an effective surplus of not less than 381,000*l.* This he holds in reserve, in case it should be found that England must or ought to come to the aid of India. Mr. GLADSTONE did not positively commit himself to the statement that India would need or ought to receive help. What he insisted on was that India ought not to receive little grants in aid. The whole burden of the Afghan war should be ascertained, and then we should be in a position to determine whether there was anything in the character of the war to impose on England the moral duty of contributing to its cost, or anything in the state of Indian finances which made the intervening help of England indispensable. No one can doubt that, if it is found possible to conclude all the operations of the war within a few months, Mr. GLADSTONE's mode of regarding the present position of Indian finance is the right one. If it were necessary to continue costly operations in Afghanistan for a long time to come, India might be starving while England was making inquiries. But, if everything is to be over by October, the total cost of the war may be approximately ascertained soon enough to make any help given by England at once seasonable and defensible on broad and general principles.

The reductions in the wine duties are expressly proposed as an instrument of bargaining with France. Parliament is not invited to sanction them; for if they were accepted once for all, they would no longer be an instrument of bargaining. France would have got all we had to give, and we should not know what France would give in return. But, as the treaty with France expires at the end of the year, the Government must be in a position to negotiate a new treaty before the present treaty expires. Our Government must have something in hand which it can give, or not give, according to the mode in which it is met; and therefore it is proposed that Parliament shall give the Government power to reduce the wine duties by means of Orders in Council. The chief alteration contemplated is the reduction of duty on the very lightest kinds of wine from one shilling to sixpence per gallon. There is then to be a graduated scale according to the ascending degrees of alcoholic strength, and the net result will be a medium duty of 1*s.* 4*d.*, and a loss to the Exchequer which this year will reach 240,000*l.*, and in future years will reach 300,000*l.* This may be termed the French part of Mr. GLADSTONE's proposals. It is not for the benefit of the drinkers of light wine that the Exchequer is willing to suffer; but it abandons a quarter of a million sterling in order to secure access for our goods to the French market. The really important part of Mr. GLADSTONE's proposals is the English part, and the chief item under this head is the abolition of the Malt-tax. Theoretically the Malt-tax has been long recognized as indefensible. Since the days of ADAM SMITH it has been recognized as an axiom that taxation should be imposed on the finished product, and not on the raw material. It is beer that ought to be taxed, and not malt. But the taxation of beer has always been supposed to present insuperable difficulties. Proposals have more than once been made to reduce the Malt-tax, but Parliament has never listened to them, as they were open to the unanswerable objection that they involved a great loss of revenue while they left a bad system of taxation altogether untouched. Half measures are impossible with the Malt-tax, and it must either be retained or abolished. Mr. GLADSTONE is going to abolish the Malt-tax and tax beer, and the revenue is to gain and not lose by the change. It will, he calculates, receive in future years 350,000*l.* more from the finished product than it now receives from the raw material. Beer is to pay a tax of six shillings per barrel, but the difficulty which has hitherto baffled all financiers is how the six shillings are to be got. Mr. GLADSTONE acknowledged that, if the brewing trade was in the position it occupied some years ago, the task would be almost hopeless; but the character of the trade has largely changed, and it is now in much fewer hands than it formerly was. The breweries in this country have during the past twenty-five years diminished by fully one-half. In 1853 there were 45,294; in 1879 there were only 22,278. If, as Mr. GLADSTONE said, private brewing is not dying a natural death, yet at any rate it is shrinking within limits so modest and so narrow that it can no longer be regarded as an obstacle to a tax on beer replacing a tax on malt. But at present private brewing is by no means dead, and there is no intention of endeavouring to stop its operations. The mode in which Mr. GLADSTONE proposes to cope with the difficulty of taxing beer produced in private breweries is to keep it well under, what he terms, the eye of the Revenue Department. To do this the means of seeing must be considerably increased, and it is proposed to spend no less than 40,000*l.* a year on new inspectors; and, what with the diminished number of private breweries and the unceasing vigilance of this roving army of officials,

Mr. GLADSTONE trusts that the CHANCELLOR of the EXCHEQUER will be able to get safely into his pocket the six shillings per barrel that will be due to him.

Every one who wishes will be allowed to brew, but then if a man wishes to brew he will have to record his intentions. He will have to obtain a licence, for which he will pay a few shillings, and which he will be able to procure at any money-order office. He will thus be marked out as a person on whom the Revenue Department is going to keep its eye. But if he is a very little man, the Revenue Department, having once noticed him, will afterwards wink at his proceedings. If he resides in a house under 20*l.* in value, he will hear no more about the Malt or Beer tax, provided he does not brew for sale. If he resides in a house above 20*l.*, and brews for his own use, he will be required to furnish a return of the amount of brewing materials he has employed, and on these materials he will be charged, the Revenue Department not in any way supervising the process of brewing or its results, but merely charging him for the quantity of beer which it thinks he ought to have made out of the materials if he knew his business. When beer is made for sale, it will be gauged while in fermentation, when Mr. GLADSTONE thinks it can be gauged most easily and effectually. The brewers will carry on the process of fermentation at any time that may be most convenient to them. They will no longer have to find the capital to reimburse the maltster for the Malt duty; and, as all brewers will pay the same trifling licence, large brewers will be relieved from the burden of the present licence, which increases with the quantity produced. Beer therefore will, it is expected, be cheaper. It will be cheaper when delivered to families, and cheaper in the hands of exporters; but it will probably not be cheaper when sold in public-houses, for the publicans are to be called upon to make an addition to the revenue which will reach 305,000*l.*, and will rise to 350,000*l.* in future years. At present the publican pays for his licence to sell beer and spirits 3*l.* 6*s.* He will in future pay according to the value of his house. 5*l.* will be the least that he can pay, and then his house must be under 10*l.*; according as his house is better he will pay more, until at last, if his house is over 100*l.*, he will pay 30*l.* Recent legislation has largely diminished small public-houses and driven custom to the larger ones. Establishments of a superior class have thus had a kind of monopoly created in their favour, and the law now proposes to take away a portion of what the law has given them. This new taxation of the publicans is perfectly justified, and the competition of the smaller houses may be trusted to defeat any attempt on the part of the owners of the larger houses to transfer their burden to the consumer. But the abolition of the Malt-tax cannot be carried out without an immediate payment of a large sum of ready money. The maltsters who have paid their duty must have what they have paid refunded to them. It is a fortunate consequence of the very unfortunate season of last year that the stocks of malt in hand are now exceedingly low, and the present is probably the year in which the abolition of the duty could be effected with the least inconvenience to the general taxpayer. Still, even if advantage is taken of this favourable occasion, the amount to be paid will be not less than 1,100,000*l.* This is the amount which the nation will have to make good in order to get the Malt-tax abolished, and Mr. GLADSTONE proposes that it shall be made good by the addition of a penny to the Income-tax. This penny will yield a sum that will at once pay off the maltsters and compensate the loss entailed by the re-arrangement of the wine duties. For this year the publicans will have the pleasure of supplying Mr. GLADSTONE with the surplus he wishes to have in hand in case he has to come to the help of India. Next year the main purpose for which the additional penny is imposed will no longer exist, as the maltsters will have been paid off. There will be a loss to the revenue through the reduction of the wine duties, but this will be more than compensated by the payments of the publicans. It may therefore be said that to the publicans the net result of Mr. GLADSTONE's accession to the Chancellorship of the Exchequer is that in the first year they will provide Mr. GLADSTONE with a surplus, and in subsequent years will pay handsomely in order to promote the circulation of GLADSTONE Claret.

MR. GOSCHEN AT CONSTANTINOPLE.

THE Government is well advised in keeping Mr. GOSCHEN's instructions secret, but the possible purposes of his commission lie within a narrow compass. He is certainly not authorized to threaten war, on the one hand, nor, on the other, to offer financial assistance. He has perhaps been instructed to declare that all the Powers are agreed in requiring the submission of Turkey to the report of the Commission which is to define the Greek frontier. He will also urge the completion of the bargain with Montenegro, which was, probably not without Turkish complicity, defeated by the professedly independent action of the Albanians. It is difficult to understand what he can add to the remonstrances of the late Government against the scandalous misgovernment of the Asiatic provinces; but possibly the SULTAN and his advisers may, since the Ministerial change in England, have paid even less attention than formerly to the representations of Sir HENRY LAYARD, on the assumption that he was likely to be soon recalled. Mr. GOSCHEN's political position in England, and his possession of the full confidence of the Cabinet, are well understood at Constantinople; but it remains to be seen whether Ministers who are believed to be unfriendly will exercise greater influence over Turkey than their more complaisant predecessors. At present the appearances are favourable; for the obnoxious Ministers who had thwarted and defied English influence have at last been dismissed. Sir H. LAYARD had in vain urged on the SULTAN the expediency of a change which may perhaps have resulted from the remonstrances of Mr. GOSCHEN. The ancient practice of relying on the rivalries and dissensions of the European Governments has not been abandoned. It is not certain that Russia may not have encouraged the policy of resistance and inaction, as in the days of General IGNATIEFF. The late French Ambassador at Constantinople never cordially supported Sir HENRY LAYARD, although his Government is supposed to have approved of the mission of Mr. GOSCHEN. The Austrian Government would probably welcome the settlement of the Greek and Montenegrin disputes, with a view to the tranquillity of its own newly-acquired provinces. Its interest in reforming the administration of Macedonia is doubtful, especially as the Russian hold on Bulgaria is constantly becoming more complete through the generals and officers who command the army. There is little use in urging on the Turkish Government the danger of defying the concert of European Powers if it is known that their policy is not identical.

Mr. GOSCHEN made a large but necessary sacrifice to diplomatic courtesy when, on presentation of his credentials, he expressed his confidence in the SULTAN's sincere desire to improve the condition of his subjects. The gross mismanagement of all public affairs was by implication attributed to the late Ministers, who were assuredly not above suspicion; but, if they encouraged corruption and tolerated anarchy, their power was wholly derived from the sovereign. Among many changes, one honest and vigorous Minister sincerely attempted the correction of abuses; and, if he had been allowed to remain in office, he might perhaps have introduced considerable reforms; but, even before his dismissal, KHAIREDDIN was hampered by the general belief that he was not a favourite with the Palace, and his successors have enjoyed a longer tenure of office on condition of advising their master to follow his own inclination. For some time after his accession the present SULTAN was supposed to be well-meaning, ignorant, and timid; but the judgment of competent observers on fuller experience has been greatly altered. It is now thought that the SULTAN possesses considerable ability, and that he originates and directs the policy of Ministers who secure his favour by implicit submission to his wishes. Either through religious prejudice or as a result of deliberate calculation, he has allied himself with the fanatical Mahometans in opposition to moderate and intelligent advisers. There is little doubt that the SULTAN was the author of the arrest of the missionary who was afterwards released through the intervention of Sir H. LAYARD, and that he originated the scandalous condemnation of the Turkish scholar who had assisted in the translation of a religious work. The assassin of a Russian officer, who has not yet been executed, is supposed to be under the personal protection of the SULTAN. A despot who really as well as nominally exercises absolute power is more difficult to deal with than a weaker ruler, who may

perhaps be persuaded to change his advisers. It may be found impossible to convince the SULTAN that he has anything to gain by deference to the counsels and demands of England, or even of Europe. The first condition of improvement would be the appointment of honest Ministers and the selection of competent provincial Governors; but the SULTAN is jealous of ability, because it is usually combined with independence. He has with difficulty been persuaded to retain the services of MIDHAT as Governor of Syria, and he would not be disposed to endure his presence at Constantinople. On this point he will probably not be exposed to English pressure, for Mr. GLADSTONE has often expressed strong dislike of the most resolute opponent of IGNATIEFF. MIDHAT'S character is perhaps not altogether unsullied, but he possesses a foresight and daring which are rare among Turkish politicians. The SULTAN perhaps can hardly be blamed for fearing a king-maker to whom he owes his own elevation.

But for untoward circumstances MIDHAT would have conferred on his country a more undoubted and permanent benefit than the dethronement of the miserable tool of Russian intrigue. As the projector of a representative system he incurred much ridicule, but when the first Turkish Parliament was returned by elections which were perhaps not always strictly regular, there was reason to believe that MIDHAT had discerned the only effectual remedy for the accumulated results of a succession of incapable despots. The provincial deputies displayed a political aptitude which has rarely been found on the Continent of Europe, by strongly remonstrating against definite grievances, instead of diverging into constitutional theories or revolutionary agitation. With the instinct of early English Parliaments they confined themselves to definite demands, and they had no desire to contest the sovereignty of the SULTAN, if it were exercised in accordance with justice and law. It is to be regretted that Lord SALISBURY, during his short residence at Constantinople, failed to appreciate the value and importance of the new institution. The Russians with greater astuteness stipulated at San Stefano for the abolition of the Parliament, which had already been dispersed during the war. If the experiment had been fully and fairly tried, it is not impossible that something like public opinion might have been formed in Constantinople itself; but it is useless to regret the failure of an institution which is not likely to be revived by the present SULTAN. The only corporate body now consulted on public affairs is the spiritual hierarchy, which can always be trusted to declare that innovation and improvement are profane. It is stated that the Ulemas have confirmed the intention of the SULTAN by declaring that it is unlawful to put to death the Mahometan murderer of a Christian victim. The SULTAN has apparently resolved to stake his dignity and throne on his success in resisting European dictation.

The solution of the interminable Eastern question is still conjectural and remote. The force of the reasons for maintaining the fabric of Turkish power has been weakened, but not altogether destroyed, by the disastrous war of 1877. Statesmen valued the Empire principally because it existed, and it was foreseen that, if anything better could be put in its place, the change could only be effected at the cost of a formidable convulsion. The substitution of Russian dominion was unpalatable to England, to Austria, and occasionally to France; but it is probable that the German EMPEROR, if not his Minister, encouraged the enterprise which, having long been meditated, was undertaken on the pretext of the Bulgarian massacres. The SULTAN still considers himself necessary to Europe because he holds the ancient capital of the narrow seas. It was to dislodge him from his post that the war was commenced, of which, according to an apparently official account, the object was declared by the EMPEROR himself to be Constantinople. None of the petty States which have been formed out of the fragments of the Turkish Empire are capable of maintaining an independent existence if they are threatened by the overwhelming power of Russia. The Prince of ROUMANIA concurred in the invasion of Turkey without a shadow of provocation; the Prince of SERVIA had in the previous year wantonly broken the peace at the instigation of Russia; the Prince of BULGARIA has lately accepted a commission in the Russian army, and he allows the Russian commander of his forces to proclaim and enforce martial law in a Bulgarian district. The Greeks might be more eligible as heirs of the decaying Empire; but their numbers and strength are insufficient to give them supremacy over their Slavonic neighbours. No dream appears for the present more empty than the project of a powerful confederation of the "free provinces of the Balkans." It will perhaps be necessary for a long time to come to defend the Turk in his possession of Constantinople; but the prospects of improving his administration are not hopeful. If Mr. GOSCHEN fails in his mission, his inability to regenerate Turkey will not prove that any other ambassador could have accomplished more.

THE CHICAGO CONVENTION.

THE contest among General GRANT, Mr. BLAINE, and Mr. SHERMAN for the Republican nomination to the Presidency has ended in the election of Mr. GARFIELD, who had not been proposed as a candidate. His name first appeared in the return of the nineteenth ballot, in which he received one vote. In the twenty-sixth ballot he had risen to two votes, and the number of his supporters gradually and slowly increased. On the twenty-ninth ballot he obtained the absolute majority of 399, and the choice was, according to custom, then made unanimous. It is said that the arrangement was made between Mr. SHERMAN and Mr. BLAINE, who from Washington directed the policy of the Convention. The nominee for the office of Vice-President is unknown to fame, except in New York, where he figures as Mr. CONKLING'S lieutenant in the management of elections and of political manœuvres. Mr. CONKLING, though he had been the leader of the GRANT party, was the first to congratulate Mr. GARFIELD on his good fortune, and the Convention separated in a state of joyous enthusiasm. In the earlier ballots GRANT'S numbers varied from 305 to 315, while BLAINE remained steady at about 285, and SHERMAN scarcely exceeded 100. Mr. GARFIELD had taken an active part in the Convention as principal leader of the supporters of Mr. SHERMAN, who has therefore in a certain sense achieved a triumph over his competitors. The majority had determined, not only that GRANT should not be elected, but that he should not be represented by any partisan substituted in his place. Mr. SHERMAN will now almost certainly be included in the future Cabinet, if a Republican President is elected. It is also not improbable that room may be found for Mr. BLAINE, and perhaps for Mr. CONKLING. General GRANT has nothing to console him for the severe disappointment which he must suffer after three years of steady calculation and incessant effort. Mr. GARFIELD may perhaps be a good President, though his name seems never to have occurred to any section of the Republican party. He has been Speaker of the House of Representatives, and he is now Senator for Ohio, the State to which the actual PRESIDENT belongs. His connexion with Mr. SHERMAN renders it probable that he is not zealous in the cause of Civil Service reform; but he has always opposed schemes for defrauding the public creditor by the substitution of paper or silver for gold. His personal character has not been assailed, though Democratic journalists will now probably accuse him of fraud or corruption. The people of the United States are never consulted as to the choice of a President. The Republican party will do their utmost to secure the election of a nominee whose name had never been thought of, except perhaps by some ingenious tactician, half an hour before he was unanimously elected.

If the Derby were run only once in four years, the excitement produced in England would be as universal as the interest caused in the United States by the Presidential election; and it would be much of the same kind. The Americans are too sensible to trouble themselves deeply about a contest which has little practical importance. They know that their country will continue to prosper under any President who can be chosen, and that he has little control over legislation, and scarcely a choice as to the discharge of his administrative duties. Many Presidents selected for their inoffensive mediocrity have passed through their terms of office without discredit to themselves or conspicuous detriment to the public interest. In several instances Vice-Presidents, elected to a sinecure office with natural indifference to their qualifications, have, on succeeding to the higher post on an accidental vacancy, maintained themselves at the ordinary Presidential level. Mr. ANDREW JOHNSON, who

was the most unfit for the position in the whole list of Presidents, did no permanent harm by his eccentricities. The nominations of the two great parties are watched with a stronger interest than the actual election, except in such rare instances as that of 1876, when the candidate who had been constitutionally elected was defeated by fraud. The final choice of Presidential Electors is a trial of strength, but it offers little scope to the ingenuity which is exercised in the management of the State and general Conventions. The game of combined skill and chance which has been played at Chicago is preferred by the great multitude of American citizens to any other form of recreation. The animated episode which occurred in one of the earlier meetings of the Convention both indicated and stimulated the genuine pleasure which is felt by the delegates and the audience.

The description of the knots of partisans who support the several candidates as factious is perhaps too complimentary or too serious. They are banded together for the moment by a common desire to win, with scarcely any ulterior motive. The Convention as a whole draws up a code or exposition of Republican policy which, as far as it has any meaning or effect, is equally binding on all the competitors. The most definite article in the creed is protection to native industry, while the vaguest and least sincere is Civil Service reform. One eccentric delegate, who declared that the Republicans intended the spoils to belong to the victors, was silenced by a unanimous protest, which his unseasonable candour deserved. The minority, which supports the SECRETARY of the TREASURY, must have been amused by its own concurrence in a doctrine which would make official position independent of political services. It is known that the numerous functionaries who depend on the Treasury have, at the instance and in the interest of the chief of the department, acted as canvassers and election agents throughout the recent contest. All the leaders of all the so-called factions are equally opposed to the abolition of political patronage. Mr. BLAINE, Mr. CAMERON, and Mr. CONKLING are, like Mr. SHERMAN, distinguished by their skill in managing all kinds of elections. The adroitness of themselves and their subordinate agents sustained the interest of the Convention by keeping its result in doubt to the last moment. Mr. CAMERON was thought to have achieved a signal triumph when he induced the State Convention of Philadelphia to instruct its delegates to vote unanimously for GRANT. Mr. CONKLING succeeded not less brilliantly at New York; but afterwards malcontent members of both delegations asserted their independence; and the Chicago Convention determined to repudiate the right of dictation by a State majority. Disputed rules for the conduct of business were avowedly accepted or rejected on the ground of their tendency to serve or to injure the interests of the candidates. Probably no foreigner has at any time fully understood the process by which in successive ballots the fortunate nominee is eventually arrived at. On many former occasions a preference has been given to the candidate who was most likely to succeed in the final contest with the opposite party; but the Republicans, notwithstanding their narrow escape from defeat at the last election, are now so confident of their superiority to the Democrats that they feel at liberty to consult only their personal predilections.

None of the candidates excited any popular enthusiasm. It had been thought possible that General GRANT would be chosen by acclamation; but the hopes of his adherents have been signally disappointed. The prejudice against a third term seems almost to have counteracted the influence of his personal distinction; and, notwithstanding the elaborate care which he has taken both to avoid contact with his countrymen and to keep himself in their recollection by the honours which he has courted in foreign countries, his questionable success as President is not less vividly remembered than his great military services. His most formidable antagonist, Mr. BLAINE, was an able and experienced politician of the familiar American type. In common with the other competitors, GRANT and BLAINE professed precisely the same opinions. It is probable that they would have conducted the Government in the same spirit, and perhaps their respective Cabinets might have been not very differently constituted. It is not unusual to console a defeated rival by making him a Minister. Mr. SEWARD, then the principal leader of the Republican party, took office as Secretary of State under Mr. LINCOLN, who had been preferred on account of his obscurity.

It can scarcely be an insular prejudice that the English method of appointing a Prime Minister by natural selection is more conducive to the public welfare than the American process of choosing a President. The ablest or most powerful member of the dominant party becomes Minister with the unanimous assent of his party. The consequence has been that for the last ten or twelve years the only living persons who have held the highest office in the State have been the present leader of the Government and the leader of the Opposition. An election of a Prime Minister by a Convention organized according to the Birmingham model would not be conducted with the light-hearted indifference which prevailed at Chicago. Every intelligent Englishman knew that the future course of legislation and policy would depend on the result of the trial of strength between Lord BEACONSFIELD and Mr. GLADSTONE. When the struggle was decided the popular voice demanded of Lord GRANVILLE and Lord HARTINGTON the subordination of their pretensions to the claim of Mr. GLADSTONE. On the impossible supposition that an ordinary member of Parliament of the political rank of Mr. GARFIELD had been directed by the QUEEN to form an Administration, all parties would have been equally amazed. A President nominated at a Chicago Convention is much more truly a product of accident than an hereditary king.

LORD HARTINGTON ON AFGHANISTAN.

LORD HARTINGTON took the utmost pains to be at once as explicit and as guarded as possible in stating the policy of the Government with regard to Afghanistan. He took the unusual course of reading a memorandum to the House, in which every phrase had been carefully weighed. It is the desire of the present Ministry to take Parliament into its confidence, but it is perfectly impossible that this confidence should be absolute. A Government cannot act at all if it is to tell beforehand all that it has to do, and however much Lord HARTINGTON might wish to trace the lines of a general policy, he was obliged to say that much must depend on circumstances, and still more on what had been arranged before he came into office. It was, he said, out of his power to lay before the House the instructions that had been sent to Lord RIPON. They related in great part to many operations of a very difficult and delicate character; and he added that information as to what is said here reaches Afghanistan with extraordinary rapidity, and the jealous and suspicious character of the Afghan chiefs renders it very necessary that no premature or incomplete disclosure of the intentions of the Government should be made. Otherwise Lord RIPON might be seriously embarrassed in the exercise of the discretion which must necessarily be left to him. No one in the House complained of this reserve, nor was any one likely to complain. Common sense tells one Parliament after another that the Ministry of the day must have secrets which it cannot disclose, and which it would be a dereliction of duty to attempt to disclose. There is no meaning in a Ministry having the confidence of the House of Commons if the House does not confide in it, and it must be trusted to manage business which requires secresy as well as business which admits of frankness. Some of the leaders of the late Opposition set up an impracticable standard of openness; and, in their anxiety to discredit the Ministry of Lord BEACONSFIELD, talked as if Parliament was in partnership with the Executive, and had a right to know everything its partner was doing. Any reticence was treated as a sort of fraud or trickery, and it was quite certain that a theory so incompatible with the exigencies of public affairs must be abandoned when those who offered it to the electors came to be invested with responsibility. It is also to be noted that Lord HARTINGTON has discovered that no part of the world is now so remote that intelligence which ought to be withheld will not penetrate to it if this intelligence is indiscreetly given. Information, he has found out, reaches Afghanistan with extraordinary rapidity. It is not very long since very severe criticism was passed on the late Government for stopping the communications of correspondents as to the turn which military events were taking. It was regarded as absurd to suppose that what was told in England would be sent back to poor ignorant semi-barbarians like the Afghan chiefs. Even if such people were told anything, it was

said to be impossible that they should know how to profit by it. They were occupied with fighting after their rude manner, or absorbed in their intestine quarrels, and had no time or thought for what might appear in English journals. All this criticism was founded on a mere delusion. Information arrives in Afghanistan, not slowly, but with extraordinary rapidity, and the Afghans appear to be of a character which is in a special manner excited and stimulated by the intelligence they so quickly receive.

The Government has, as Lord HARTINGTON informed the House, two main objects which it will keep in view while determining its Afghan policy. The first object is to bring the actual military operations to a close. Expeditions are still being undertaken from time to time from headquarters, for the purpose of punishing or reducing to submission tribes who have assumed a hostile attitude, or threatened or attacked our communications. Lord RIPON has been instructed to restrict the area and scope of these operations as much as possible, and to avoid any further collision with tribes beyond the limits which we now occupy. Of course, while the QUEEN's troops remain in the country, their supplies and communications must be secured. But the Government want above all things to get the QUEEN's troops out of Afghanistan. General DONALD STEWART has already received orders to withdraw his troops with the least possible delay compatible with their health; and it is rumoured that Cabul is to be evacuated not later than the end of October, and that the staff and stores not required for the purpose of holding Cabul until the end of October are to be at once sent back. The occupation of Cabul is thus, in one sense, at an end. The troops will stay there for a little more than four months, not because the Government wishes they should remain there, but because they cannot be brought back until the cold weather sets in. It would be most dangerous to bring troops that have been more or less acclimatized to the temperature of the Afghan highlands down to such a fiery furnace as Peshawur is in the hot season. Cholera and dysentery would do more mischief in a month than the arms of the Afghans could do in a year. But the Afghans will know with extraordinary rapidity—or it may be said that they know in a few hours after Lord HARTINGTON spoke—that the English troops are now staying on in Cabul for merely sanitary reasons. They are not there to impose a settlement on the country. If the Afghans can settle their affairs before the end of October so much the better for them and for England. But the presence of the troops will no longer be an instrument of pressure to force them to a settlement. They have only got to abstain from threatening or attacking the English communications and they need take no count of the English army. In one way Lord HARTINGTON may be said to be only talking the language of the late Government. They always spoke of retiring when possible. They constantly disclaimed any purpose of a permanent or even of a prolonged occupation. But it must be regarded as in some degree a new departure to say that the possibility of withdrawing the troops is only a question of sanitary prudence, and that the Afghans have simply to determine among themselves who it is to be that shall take over Cabul when the English leave it at a date by which they are pledged to hand it over to some one.

The second object of the Government is to leave behind something like the prospect of a settled government. What are its precise views as to the direction in which Lord RIPON should work in order to attain this very desirable end, is the secret which Lord HARTINGTON cannot disclose. Matters, as Lord HARTINGTON said, are not sufficiently advanced to enable him to give any definite information. But even without being in the secrets of the Government, it is easy to see that any settlement towards which the Government is working must be one of two kinds. There must either be one ruler in Afghanistan or many. If there is to be one ruler, he must either be actively supported by the British Government, or he must be a person who, by his own superior energy, his eminence of character, and his command of resources and men, can overawe all rivals. The Government cannot intend to place and keep its nominee in power, for its nominee could not govern for a day if the English troops were removed from Cabul. A person capable of overawing all rivals is not likely to drop from the skies. If such a person existed, or was likely to reveal himself before the end of October, his name and qualifications must surely be known already. It is therefore probable that the Government contemplates the division of Afghanistan into principalities, either independent of each other or bound by merely nominal ties to one common chief. We are going at the end of October to give up Cabul to some one, and if we cannot find a big man to whom to give it up, we must give it up to a little one. On one point Lord HARTINGTON thought himself at liberty to give some definite information. The present Government wishes that in retiring from Afghanistan we should retire from it altogether, if to retire from it altogether is found possible. Lord HARTINGTON said that he did not know whether we had come under any undertaking with regard to Candahar. If we are bound to any one we must of course abide by our engagements, nor was Lord HARTINGTON prepared to say that whatever might have been done to pledge us in regard to Candahar was objectionable. He might find that the course already taken was the best course to take under the circumstances. But, so far as the Government found the field clear, it would approach the subject with an anxious wish to have as little to do with Candahar as may be practicable. Lord HARTINGTON cannot contemplate without alarm the prospect of a large British force being permanently quartered in Candahar. We do not suppose that any one would regard with pleasure such a prospect. What has to be decided is whether Candahar is of a value to us that no other part of Afghanistan is; and whether, if it possesses this value, it can be kept subject to our special influence, although no large force of British troops may be quartered there. In the same way the Ministry approaches the subject of the scientific frontier which it was supposed was secured for us by the treaty of Gandamuk with a desire to have as little of this scientific frontier as possible. It will inquire whether the scientific frontier is of any real value for military purposes, and if it finds that only a portion of it is of any military value, it will only retain as much as can be shown to be necessary or prudent to hold. The information on this head given to the House was of considerable importance. Lord HARTINGTON did not attack the policy of the late Ministry. He undertook to carry out all to which the late Ministry was positively pledged. He may even be said to be aiming in a general way at the objects which the late Ministry set before it. But it cannot be said that he is working in the same manner as that in which the late Ministry worked. His policy may be good or bad, but it is not one that he has borrowed.

THE FRENCH COMMERCIAL TREATY.

AN abundance of objections may be brought against the principle of a treaty of commerce. It is at best a concession to economical weakness; an acknowledgment that in matters of business, as in other matters, human nature has to be tempted into doing what is good for it. In such a world as free-traders once dreamed of, a treaty of commerce would be an absurdity. Long before this, it used to be supposed, every civilized country would have welcomed the produce of every other, and have regarded Customs duties as an unpleasing tribute to the coarse necessities of revenue. We must live and pay our way, each Government would have said pensively to its neighbours; and money is so hard to come by that we must raise a little of it out of the goods which it suits you to send us. But that little shall be as little as possible, and it shall become less as our people learn to appreciate the ennobling privilege of paying direct taxes. Unfortunately, civilized Governments other than our own have said the very opposite to all this. The only kind of free-trade which they set any value on is a strictly one-sided kind. They want to get their own goods admitted on easy terms into England. From first to last it is only the producer that they think of. In his interest they are willing to sacrifice their own consumers or to benefit English consumers. They regard the community solely in its producing capacity, without in the least recognizing the fact that each producer is himself a consumer of more things than he produces. A treaty of commerce is an attempt to turn this curious tendency to good account. This generation of Englishmen has pretty well abandoned the hope of seeing Free-trade become general, and it finds in such negotiations as those which

the English Foreign Office is now carrying on with France the best available substitute. The French Government will not hear of letting in English goods duty free, but they are willing to make a bargain with us. It is useless to talk to them about the French consumer, or to dwell on the yearning he may be supposed to feel for English manufactures. That is a yearning which the French Government recognize only to check. But they will listen if you talk to them about the French producer, and point out to them that, if they will only let this or that description of English goods come into France at a reduced duty, this or that description of French goods shall be allowed to come into England at a reduced duty. It is a come-down, no doubt, for Free-traders to have to use this language; but in their present low estate there is no other that they can use. Foreign countries do not, unfortunately, grow wiser by experience. The more they tax imports the more they seem to like the process. One interest after another gets protected, and when all stand on the same footing, those which were first protected want to be put on the same vantage-ground which they first occupied. Left to themselves, therefore, foreign Governments are only likely to alter their tariffs in the wrong direction until at length English manufacturers will have no markets but their own to sell in. In circumstances like those, a Free-trade Government cannot any longer stand on its dignity. It must take the world as it finds it, and recognize what a terribly protectionist world it is.

Just now the need for recognizing this as regards France is especially pressing. The French Chambers have all but adopted a new general tariff, which will apply to the goods of all countries with which France has not a treaty of commerce. In six months' time England will in the natural course of things be a country with which France has not a treaty of commerce, and the new general tariff is not of a kind to make the prospect of coming under it a pleasant one for English manufacturers. Their position, as compared with that which they occupy under the expiring Treaty of Commerce, will be worse in two ways. The duties levied on English goods will be higher, and they will be levied in a more injurious and prohibitive manner. The nominal increase of duty will be about 25 per cent. all round, and the fact that the duties will be specific, and not as now *ad valorem*, will cause a further increase varying from 20 to 100 per cent. English manufacturers contend that it is impossible to levy a specific duty on British textiles which shall not work with great inequality. The duty, they say, which will not tax a fine woollen cloth more than 5 per cent. may tax a low-priced cloth of very similar appearance at 60 per cent. In all ways, therefore, there is just cause for the alarm which English manufacturers now feel, and the Government has done no more than it was bound to do in considering whether it had any power to help them. Unfortunately, the more thoroughly a country is committed to the principle of Free-trade, the harder it is for it to negotiate a treaty of commerce. The protectionist country offers to make certain reductions of certain duties, and as these duties are in excess of revenue requirements, it is perfectly able to carry out its undertaking. But the free-trade country levies duties only for revenue; and consequently it has no margin out of which to make reductions. If it reduces a duty, it has to provide an equivalent amount of money in some other way. The Treasury has to be filled, and if it is no longer filled by a duty on French wines or French silks, it must be filled by a duty on some other imported article, or by direct taxation. To fill it by a duty on some other imported article is out of the question. The French Government could not consent to any other French produce being more heavily taxed without risking unpopularity at home, and the most-favoured-nation clause prevents us from levying higher duties on the goods of other countries than are levied on French goods. This is the dilemma in which Lord GRANVILLE found himself when he began to negotiate with M. LÉON SAY. He had to go to market with empty pockets, unless he could persuade Mr. GLADSTONE to give him something to put in them before starting. When he received the deputation from the Associated Chambers of Commerce on Tuesday, he could only speak in general terms of what Mr. GLADSTONE might be able to do in this way. But he fully adopted, and even insisted on, that view of the action of the new general tariff, and consequently of the need for a new treaty of commerce, which had been pressed on him on behalf of the Association. If any change is made in the tariff in its passage through the Senate, it will be a change, he thinks, for the worse; and in all probability the tariff will have been adopted by the middle of next month. He spoke hopefully, however, of the progress made in the negotiations, and of the probability that under the new treaty the present conventional tariff may be not only maintained, but ameliorated. As the event proved, he knew that something had been given him to put in his pocket, but what that something was he could not say until Mr. GLADSTONE had introduced his supplementary Budget.

On Thursday evening the secret was disclosed. The French Government have made a specific demand upon the English Government, as the only consideration upon which they will consent to renew the expiring Treaty of Commerce. They complain that the duty of a shilling a gallon which is now levied on wines of the lowest alcoholic strength bears very hardly on a great deal of their produce. There are many wines, they say, which, if this duty were reduced, it would be worth while to import into England, though the present duty, small as it is, excludes them. If they can get this duty lowered by one-half, they will consider what modifications they can make in the general tariff for the advantage of English manufacturers. If they cannot get this concession, then the treaty must go, and the general tariff be applied to English goods as to all others. The first question for the English Government to consider was whether this decision was irrevocable; and here no doubt M. LÉON SAY's presence was of great value. M. SAY is a thoroughgoing Free-trader; consequently he would start from the same point as Lord GRANVILLE, and only have to part company with him when there was no hope of inducing the Government he represented to go any further in the right direction. There is no reason to doubt the general disposition of the present French Cabinet towards Free-trade; but on a matter of this kind it is impossible for a Government to be very far in advance of the nation, and the only way apparently in which Frenchmen can be brought to disregard the clamours of the producers who will be losers by the substitution of a conventional for the general tariff, is to arrange that these clamours shall be drowned in the still louder rejoicings of producers who are benefited by the substitution. If the wine-growers can be brought over to the side of the treaty, the Government can listen without uneasiness to the complaints of the cotton-spinners. The next point which presented itself to the English Government was whether the duty on wines of low alcoholic strength could be lowered without injustice to the English taxpayer, and Mr. GLADSTONE is of opinion that it can. The additional sum that the CHANCELLOR of the EXCHEQUER will have to provide in consequence is less than 300,000*l.*, and against this loss to the English taxpayer must be set the direct gain which will accrue to him in his character of a consumer of wine, and the indirect gain which will accrue to him from the increased prosperity of British trade. Mr. GLADSTONE makes no allowance for the possible gain to the revenue by reason of the increased consumption of wine consequent on the importation of wines of a cheaper class. But for the *Phylloxera* we should have been inclined to expect a good deal from this source; but in the present melancholy condition of this great industry it is, no doubt, safer to leave such a contingency altogether out of the account.

THE NAVY.

MONDAY night's debate on the Navy Estimates was necessarily a tame one, as the present Government does not propose to make any but trifling changes in the scheme which three months ago Mr. W. H. SMITH submitted to the House of Commons. To some extent, indeed, it is precluded from doing so. In bringing forward the Estimates, which are practically a reprint of those previously issued, Mr. SHAW-LEFEVRE, who found it convenient to ignore some broad assertions which he made not very long ago, observed that the late Parliament, by voting before Easter the number of men, had in effect determined many of the votes which he had to lay before the House, and also "that the Government had found on coming into office "that the programme of works at the dockyards had been "carefully laid down with a view to building and reliefs, "and that the stores had already been contracted for." The Government had therefore no choice but to accept

what had been already prepared and settled, unless indeed they were so thoroughly dissatisfied with their predecessors' scheme as to think it worth while to give a good deal of trouble at all the dockyards, and possibly to incur considerable expense in order to change it. They did not apparently consider it so radically bad as to make this revolutionary proceeding necessary, and they determined therefore to accept, with just enough change to show that they had to some extent exercised their own judgment, the Estimates prepared by Mr. SMITH and his colleagues. Clearly, then, there was little to be said in the House of Commons, so far as the Ministry and the Opposition were concerned. Mr. SHAW-LEFEVRE could find no grave fault with Estimates which the Government accepted almost in their entirety. Mr. SMITH, on the other hand, could not possibly censure the present Lords of the Admiralty for accepting his scheme without any material change. The independent naval reformers were of course at liberty to say what they liked; but unfortunately their utterances are not often such as to command attention, and on Monday night their speeches were, for the most part, little above the average.

They might, indeed, have found good ground for severe criticism, if they were not, for some reason impossible to gauge, almost unable to see what are really the weak points of the system now followed by the Admiralty, and were not given to attacking just that which is most easily defended. In the course of his suave speech Mr. SHAW-LEFEVRE did certainly indicate one very grave fault on the part either of the principal authorities at Whitehall or of those who work under their orders at the dockyards. The construction of an ironclad now takes more time than is required in America for building a big city. Mr. SHAW-LEFEVRE pointed out that the *Inflexible* would, when completed, have been nearly eight years in course of construction, and that the *Agamemnon* and *Ajax*, which he described as smaller *Inflexibles*, would, according to the programme of the late Government, take respectively ten years and a half and eight years to build and complete; and he observed, certainly with no overstatement of his case, that this "was a very long time for "the construction of an ironclad." To most people it will probably appear a preposterous time, even when allowance is made for the delay which was caused by the objections made to the design of these ships and by the necessity for experimenting with steel and compound plates, which arose long after they had been begun. Mr. SMITH, in replying to Mr. SHAW-LEFEVRE, could only say that, "with regard to "the *Inflexible*, some delay had certainly arisen, in conse- "quence of the careful inquiries which it had been deemed "necessary to make with regard to her design; but he "believed the time had not been wasted, and that the "*Inflexible* would prove a very important addition to the "offensive and defensive arms of the country." This certainly was but a feeble defence; and, as Mr. SMITH said nothing about the huge periods required for the smaller *Agamemnon* and *Ajax*, it may safely be assumed that these ships have been dawdled over in a manner which is quite indefensible. Sensible of the delay which has occurred, the present Government intend to hasten the construction of these vessels; but their proposal with regard to them is certainly characterized by remarkable caution and by profound regard for economy. An additional 20,000*l*. is to be expended on them; but, lest this not very gigantic outlay should seem extravagant, it has been determined not to begin the new ironclad which the late Government had intended building at Chatham Dockyard. Why the commencement of this vessel is to be postponed for a year it is impossible to understand, inasmuch as the sum required for the *Ajax* and *Agamemnon* is to be saved from the vote for contract vessels, which proves to be larger than is required. While blaming, not without justice, the late Administration for delay in building ironclads, the present Lords of the Admiralty propose to postpone for a year, without any reason whatever, the construction of a vessel of the first class. Their doing this is the more remarkable because they are fully aware of the time which must under any circumstances be occupied in building ships of this type, and of the impossibility of increasing the number of them during a war. There has been great delay with regard to the vessels which have been mentioned, and no doubt the periods which have been occupied in constructing them might have been much diminished; but, even when there is all possible diligence, the construction of an ironclad must require considerable time. Accepting the correction of another Member, Mr. SHAW-LEFEVRE named three years and a half as the shortest time in which a ship of some six thousand tons weight of hull could be built, and stated that this period must often be unavoidably exceeded. It would therefore be impossible, he said justly enough, to improvise such vessels in time of war. We have pointed this out more than once, and are glad that the Parliamentary representatives of the Admiralty are at length becoming conscious of a not unimportant fact. They appear, indeed, to be rather frightened by it now that they fully realize it. Mr. SHAW-LEFEVRE said that "it seemed that it would be hardly worth while in "time of war to lay down ironclads," and he proceeded to argue with undeniable force that when a Government could anticipate a period of peace, and had no fear of disturbance, "it would be wise to expend as much as possible of the re- "sources available for the navy on that work of the most "permanent character, and such as could not be im- "provised in time of war." At the present moment there was, he hoped, "no fear of immediate disturb- "ances such as had alarmed the country during the last "three or four years," and the policy of the Admiralty would be to hasten on the building of ironclads in hand, and, when new vessels were laid down, to advance them as rapidly as possible. In proof of their fidelity to this policy, and of their recognition of the facts which have been mentioned, the Admiralty are going to spend the sum of 20,000*l*., which by accident they have to spare; but, frightened by this vast outlay, they postpone for a year the commencement of a new ironclad. According to Mr. SHAW-LEFEVRE's statement, this is the course that should be adopted if war were imminent, and perhaps some enemies of the Government may say that this singular inconsistency is due to the fact that they do not really believe in peace.

In other respects the statement of the SECRETARY to the ADMIRALTY was not a satisfactory one. It is perhaps foolish to expect that the present Ministry will take a wider view of questions relating to the national defences than the last ever did; but nevertheless it might have been hoped that, while they were yet animated by the fervour of men fresh in office, they would pay some attention to those grave complaints concerning the present strength of our fleet which have been made of late, and to which no reply has as yet been attempted. It has been pointed out again and again that, though the strength of our navy has increased absolutely, it has diminished relatively—that is, that the fleets of the principal European Powers are much stronger in proportion to the British fleet than they were. It has also been shown that there is now an even greater necessity than there formerly was for a large number of swift cruisers to protect our commerce, and, above all, our supplies of food. In estimating the strength of the navy, therefore, it is necessary, if any real estimate of our power at sea is desired, to take into consideration the strength of foreign fleets, and also to give some heed to the huge streams of traffic which have to be guarded. These matters, however, Mr. SHAW-LEFEVRE completely ignored. He attempted no sort of comparison with foreign fleets, but complacently said that there were more ironclads in reserve than there had been in his recollection, and that there were no less than three quick cruisers building. Seeing what vessels of this class would have to do in war-time, this certainly seems a remarkably small number; but the present rulers of the Admiralty are apparently quite content with it, and trust, as their predecessors did, to being able to arm a great many swift merchant steamers in the event of a war. These vessels may prove valuable auxiliaries, and may possibly be able to convoy fleets; but it must be remembered that very little is known of their actual capabilities as war ships, and that it is very possible that they would be found useless against vessels designed and built for the purposes of war. The Admiralty may possibly be right in their bold reliance on merchant ships, some thirty of which, it is said, could quickly be made fit for service; but, unless they are in possession of facts very different from those which usually come to light respecting great merchant steamers, much doubt must be felt as to the value of these auxiliaries. If they should be found useless in a war, our commerce would be exposed to the gravest danger. How lamentably insufficient is our fleet of fast cruisers has been shown by a careful comparison of them with those possessed by other Powers, and it should either be largely augmented,

or else the possibility of utilizing merchant ships should be placed beyond a doubt. To build ships, however, or to buy ships and make experiments with them, costs a great deal of money, and to propose any increase of expenditure which cannot be shown to be absolutely necessary is to incur that charge of extravagance which is equally terrible to Liberal and to Conservative First Lords. It is no doubt hard that the burdens of the British taxpayer should be increased because our commerce is open to attack by foreign Powers who persist in maintaining fleets which are not necessary for their defence; but it is useless to ignore the fact that those fleets exist and that they are not likely to be diminished. If the risks of fire increase, a higher rate of insurance must be paid; and a country whose very existence depends on its navy must be willing to spend money in increasing that navy when it is seen that foreign fleets are being largely augmented, and that, in augmenting them, special attention is given to those vessels which are most formidable to commerce.

OPIUM.

THE dependence of Indian finance on the opium trade is not satisfactory to statesmen; and the nature and circumstances of the traffic have often disturbed sensitive consciences. If opium were exported from India to China in the ordinary course of commerce, the moral indignation which finds periodical utterance in Parliament would be in a great degree dissipated. The blame would be distributed among the growers, the merchants, and the consumers, all of whom are profoundly indifferent to English opinion. It is not surprising that stronger objections should be raised against the actual system. The Government has established for itself a monopoly in the production of opium, and the drug is admitted into China under the sanction of treaties which were imposed after a successful war. Although ingenious apologists have sometimes contended that opium taken in moderation is harmless or wholesome, the evidence of its deleterious quality when used to excess is entirely conclusive. There is no more valuable medicine, but the habitual use of the drug as a sedative or a stimulant is, if possible, more pernicious than a similar consumption of gin or of rum. In all such cases the craving proves more and more irresistible; and smokers of opium to excess probably bear as large a proportion to the whole number of consumers as drunkards to the multitudes who indulge in alcohol. One of the speakers in last week's debate ingeniously suggested, in aggravation of the alleged mischief, that opium, unlike ardent spirits, never does good except as a remedy in illness. The use of the drug in this country is fortunately so infrequent that there is little opportunity of judging whether moderate consumption is objectionable. English opium-eaters and opium-smokers are probably led into the practice by morbid habits of constitution which may be supposed to tempt them into excess. Large districts in China are exposed to malaria; and probably the most effective remedy for marsh fever may also protect those who are subjected to the risk of the disease. If opium could in other countries than China be confined to the dispensaries, there can be little doubt that the advantage of the change would greatly preponderate over any possible drawback.

Mr. PEASE and his supporters expatiated on the crime of making profit by the growth and sale of an article which may by a slight exaggeration be described as poison. They were not careful to inquire whether the abolition of the Government monopoly and the renunciation of the rights acquired by treaty would prevent or diminish the consumption of opium in China. It was enough for them to propose that the English and Indian Governments should no longer engage in a traffic which they denounced as criminal. The growth of indigenous opium in China, or the importation of the drug from Persia, might possibly supply the place of the India trade, so that the consumption would not be diminished. It was plausibly argued that a wrong ought not to be committed merely because the same results might be produced by other agents. The opponents of the Indian monopoly lay stress on the frequent professions made by the Chinese Government of its aversion to the trade which it is compelled to permit. That it is unwilling or unable to prevent the consumption of opium is sufficiently proved by the demand which alone renders the trade profitable or possible. Mr. PEASE himself would probably be embarrassed by the sudden and complete concession of his philanthropic claims. Amongst other consequences, the contraband trade which before the regulation of the system by treaty produced, enormous evils would immediately revive; and unless the production of opium in India were arbitrarily prohibited, the supply would probably be increased by private enterprise. It happens that the Indian cultivators of opium are not addicted to its use; but, if it were to be greatly cheapened by the suppression of the Government monopoly, it is possible that a taste for the drug might be created or stimulated. As long as the Government, being the only customer, fixes the price of the article, the area of cultivation is artificially limited. The profit on resale, as far as it raises the price of opium to the purchaser, tends to check consumption.

According to the French proverb, he who desires the end implicitly approves the means by which it is to be attained. An agitation for the abolition of the opium monopoly involves a demand for the surrender of the revenue which it produces; yet the assailants of the system scarcely mentioned the inevitable and immediate consequences of the stoppage of the trade. Sir GEORGE CAMPBELL, whose ample knowledge and transparent candour compensate for occasional deficiencies of tact, shocked the philanthropists by boldly declaring that, if the Chinese were in any case to be poisoned, he would rather reserve the profit of the operation to the people of India than transfer it to foreigners. Paradoxes of this kind are seldom acceptable to a popular assembly, but they often express sound principles in a striking form. Sir G. CAMPBELL's apparently cynical proposition merely affirms that the consumption of opium in China is not produced by the Government monopoly of opium in India. The use of the drug may probably not extend over the whole Chinese Empire; but a vast population insists on procuring the commodity, and the Indian Government happens to be in a position to levy a toll on the trade. Englishmen who maintain their army and navy by means of duties on drinking and smoking ought not to be greatly scandalized by the opium sales which add five or six millions to the Indian revenue. The gravest objection to the proceeds of the opium monopoly is not that they are wrongfully acquired, but that they are insecure. If the Chinese were to practise total abstinence, or if they grew their own opium, the Indian Government would be involved in serious financial difficulties. Yet it would be absurd to anticipate a possible catastrophe by voluntary renunciation of one of the most productive sources of revenue. If Mr. PEASE and his friends had been members of the Opposition, they might have found satisfaction in taunting some of the present Ministers with real or apparent inconsistency. Many years ago Mr. GLADSTONE had been a principal opponent of Lord PALMERSTON's Chinese policy, including both the war and the treaty on which the opium monopoly manifestly depends. As he stated in the debate, he had, by a coalition with Mr. DISRAELI, Mr. COBDEN, and Lord JOHN RUSSELL, defeated the Government on the issue of the Chinese war, though the verdict of the House of Commons was summarily reversed by the constituencies at the election which followed. After a quarter of a century which has since elapsed, it is too late to inquire whether Mr. GLADSTONE objected more strongly to the possession of office by Lord PALMERSTON or to the trade in opium. It is now his duty to regard the interests of India; and he properly disregards appeals to his conduct in 1856.

The eloquent indignation of Dr. CAMERON and Mr. SULLIVAN against Lord HARTINGTON fully justified the phrases by which it was provoked. Instead of entering into subtle disquisitions on morality and political econom[y] Lord HARTINGTON, like a man of sense, looked only at [the] practical issue. Whether the monopoly is justifiable [or] criminal, it cannot be abolished except with the loss of the whole revenue which it produces. As Indian Minister, Lord HARTINGTON simply declared that such a sacrifice was absolutely impracticable. He has already a large deficiency to deal with, and he will not, in deference to any arguments, plunge into hopeless bankruptcy. Dr. CAMERON and Mr. SULLIVAN illustrated in their speeches the cheap morality at which Lord HARTINGTON had by anticipation justly sneered. Neither orator thought it necessary to explain how or by whom a substitute was to be found for the income derived from the monopoly. Simple abolition would throw the whole burden on the people of India, for none of the promoters of the agitation proposed that the loss should be made good at the expense of England. As

Mr. GLADSTONE afterwards said, it would be idle to expect that Parliament or the country would submit to an income-tax of threepence or fourpence in the pound for the relief of questionable moral scruples. Lord HARTINGTON might have escaped rebukes to which he may probably have been indifferent by the easy process of humouring the vulgar appetite for cant. Dealers in cheap morality always resent exposure of the quality of their wares. Mr. SULLIVAN was struck with horror at the avowal that, whether opium was wholesome or pernicious, the Indian Government must continue for the present to sell it. If Lord HARTINGTON had disguised a necessary decision and a conclusive argument in a cloud of sentimental rhetoric, he would have been applauded by critics intolerant of the naked truth. It is better to rest on a practical reason than on ingenious subtleties. When the subject was formerly discussed, Mr. GRANT DUFF proved from the abundance of his knowledge that opium was, on the whole, a useful and valuable commodity. Lord HARTINGTON has probably not examined the question, and he finds it safer to rely on the real motive of the action of the Indian Government. Mr. FAWCETT, as a voluntary representative of the Indian taxpayers, is equally disinclined to add to their burdens for the sake of an extremely doubtful benefit to Chinese opium-smokers. It was pleasant to observe that Mr. GLADSTONE himself, under pressure of official responsibility, descended from the region of sentiment into a prosaic consideration of financial necessities. The general confidence in Lord HARTINGTON'S judgment will not be diminished by the expression of his contempt for cheap morality.

RELIGIOUS LIBERTY IN FRANCE AND ENGLAND.

THE French nation has of late given up so large a part of its time to the discussion of its religious affairs that it is not wonderful if foreigners have been more than ordinarily frank in their treatment of the subject. If Englishmen, in particular, had been civilly told to mind their own business, we do not know that any very telling answer could have been given to the hint. We might have felt that, after all, the French have the best right to say where it is that their shoe pinches; and that, however mistaken we may hold their selection of the spot to be, English journalists are not *ex officio* members of an International Court of Appeal in matters ecclesiastical. In your country, a Frenchman might have said, the Church of the majority of the nation is not hostile to the secular Government, nor have you any reason to suspect that many thousands of religious teachers are daily teaching their scholars to love the Church and hate the Republic. The difficulties we have to deal with are special to ourselves, and until our critics share them with us their advice will be of very little use. Religious orders are no annoyance in England; they are merely one of the characteristics of a religion which is only the religion of a fraction of the population, and that fraction one which is at all events peaceably disposed to the civil authorities We are confronted by quite another state of things, and that state of things we must take leave to meet without any reference to your good or bad opinion of us.

This would have been an intelligible, and in its way an effective, mode of dealing with English criticisms of the recent French policy towards the religious orders. M. JOHN LEMOINNE, the best-known journalist in France so far as Englishmen are concerned, has preferred to carry the war into the enemy's country. He sees in certain Parliamentary incidents an opportunity of lecturing Englishmen upon the sad indifference they display to the immortal principles of religious liberty established in 1789. He writes, of course, with that forbearance which becomes the citizen of a country more happily situated in this respect. Liberty of conscience is not as secure in England as it is in France—that he sorrowfully admits; but still England has done a great deal towards establishing it, and her more fortunate neighbours must not bear too hardly upon her. Considering that negotiations are at this moment in progress for the settlement in England of certain Frenchmen who expect to be driven out of their own country for no reason whatever except that they wish to live together and do certain works of charity and religion in common, M. LEMOINNE'S tactics have at least the merit of courage. As he has all along been a defender of the decrees against the religious orders, we are bound to believe that, if the English Government had adopted a similar course and determined to put in force the "exist-"ing laws" against the Jesuits—some of them are only half a century old, and so are mere legislative babes by the side of the venerable statutes which the antiquarian industry of M. DE FREYCINET and his colleagues has lately brought to light—he would not have accused us of intolerance. What we have done must presumably be something very much worse than this, since it enables M. LEMOINNE to get on his high horse and survey our misdeeds with the serene compassion of a saint who can feel for a sinner more kindly than if he were himself more frail. Unfortunately M. LEMOINNE has not been able to resist the temptation of dressing up his facts to suit his purpose. It is not, for example, quite consonant with the fact to say that the House of Commons has constituted itself a department of the Inquisition, inasmuch as it has undertaken to frame a definition of atheism. Probably M. LEMOINNE knows as well as we do that what the House of Commons has lately been considering is not whether Mr. BRADLAUGH is an atheist, but whether Mr. BRADLAUGH can be permitted to take an oath the formula of which he has already declared to be to him meaningless. It must be remembered, however, by way of excuse, that, if M. LEMOINNE had stated the facts in this way, he would have had nothing to gain by stating them. They would not have proved what he wishes to prove. The House of Commons is in no way concerned with Mr. BRADLAUGH'S religious or irreligious opinions, further than as they are supposed to destroy the binding force of an oath which he proposes to take. Supposing that Mr. BRADLAUGH had been an Ultramontane Roman Catholic, and had offered to take the oath after declaring that, owing to the absence of some specific Catholic formula, it had no value in his eyes, the position would have been precisely the same, and the House of Commons might equally have been called upon to decide whether under the circumstances he should be permitted to take the oath. Probably M. LEMOINNE would then have said with equal inaccuracy that the House of Commons had constituted itself an Œcumenical Council to determine upon a definition of Catholicism. What is really in issue in the present stage of the BRADLAUGH case is a question not of religion but of morality—the question whether, if oaths are to be retained at all, they may be taken by men who have already declared that they convey no significance to their minds.

M. LEMOINNE is more pardonably at sea in the matter of the Burials Bill, because his confusion upon this head is shared by many Englishmen. He is very merry over the application of the text "Compel them to come in," to bodies from which the souls have departed, and over the curious conflict which he discerns in the existing law between the civil right to be buried in the parish churchyard and the ecclesiastical right to forbid any service but that of the Church of England to be used in the churchyard. "We "see," says M. LEMOINNE in his superior way, "that all "countries have their religious difficulties, and that these "difficulties are always raised by the pretensions of "the Church to a monopoly." The Church of England claims no monopoly in deceased Dissenters. On the contrary, the clergy have constantly complained of having deceased Dissenters thrust upon them. Historically there is no such thing as what M. LEMOINNE calls "le cimetière de la Commune." There is the burial-ground belonging to the parish church, and open to Dissenters on the theory that they, like all other Englishmen, are members of the Established Church. It has now for many years been acknowledged that Englishmen are not necessarily members of the Established Church; that, as a matter of fact, a great number of them belong to other religions. How is it a "pretension to monopoly" for the clergy to say, Now that you have avowed that you do not belong to the Established Church, you have no longer any right to be buried in the parish churchyard? We claim no right to prevent you from having burial-grounds of your own; we do not even exact any evidence of your membership of the Established Church beyond the willingness of those who bring you to be buried to submit to the rite which has always been performed in churchyards. All we contend is that the claim of every Englishman to a stipulated share in the burial-grounds and services of the Established Church falls to the ground when the pretension set up on his behalf is in itself an evidence that he was not in his lifetime a member of the Established Church.

M. LEMOINNE must be very conscious of the weakness of his own case when he has to attack an adversary on such feeble grounds as these. Is it worse to be excluded from the churchyards except on condition of being buried with a particular service, or to be banished from the country on no condition at all? If M. LEMOINNE's argument is to go for anything, he must make out that to say to a Dissenter, If you do not want to be buried as a Churchman do not come to a churchyard to be buried, is a greater violation of religious liberty than to say to a Jesuit, If you want to remain in France you must apply for Government authorization, and as we warn you beforehand that this authorization will not be given, the sooner you pack up and get off the better. M. LEMOINNE is free, of course, to maintain this doctrine; but in doing so he cannot expect to escape the fate which the defenders of paradoxes, as of untenable positions in other kinds of warfare, bring on their own heads.

MARRIED WOMEN'S PROPERTY.

THE Bill which Mr. HINDE PALMER has brought in, and which the House of Commons read a second time on Wednesday, with reference to married women's property, calls itself modestly a Consolidation Bill, but proposes, as a matter of fact, that a good many new particulars should be incorporated in the consolidation. Its proposer suggested his own absence from the House, and the well-known apathy of the last Parliament, as the only reasons he could think of for the fact of the measure not having become law long ago. There may, however, not be wanting people who will think that, if the crimes of the last Parliament were not blacker than its ignoring of this measure, and if the virtues of Mr. HINDE PALMER are to be inferred solely from his reintroduction of it, then, on the whole, the old Parliament might as well have continued to sit in St. Stephen's and Mr. PALMER to sit out of that building. The Bill, it is true, was read a second time, its advocates congratulating themselves on the attitude of the House towards it. But the House of Commons has a pleasing habit of reading a second time without much demur measures which have a very faint chance of struggling through their further stages, and which, if they ever do struggle through, emerge in a condition in which their authors must have considerable difficulty in recognizing them. The speech of the ATTORNEY-GENERAL, who signified his provisional acceptance of the Bill, subject to alteration in Committee, was in reality an argument against its most salient features and its most obvious consequences. Except certain prominent "social scientists," such as Mr. HASTINGS and Mr. SHAW LEFEVRE, the friends of the measure almost invariably praised its principle with much effusion, and then proceeded impartially to pick it to pieces, and to show that this provision was unjust, that socially unwise, and so forth. The Bill indeed as it stands is one of those which, if we were guided in legislation by strict common sense, ought to be at once negatived, but which, in the existing state of things, and especially in a Parliament where it is necessary to throw sops to crotcheteers in matters supposed not to be of the first importance, often get passed, though their teeth and claws are pretty generally drawn and clipped in the process. It would probably be difficult to draw up an apparently harmless-looking Bill which should have the capacity of doing more mischief than this, or of upsetting more needlessly and more harmfully the social order of the country. It is remarkable that the objections to its proposals as most strongly stated have not come from sentimentalists, or from bigoted Conservatives, or from persons practically unacquainted with the relations of husband and wife on the large scale. Proposals which have been stigmatized as dangerous and unjust by the Judge of the Divorce Court must be said to come before the public with a rather heavy onus upon them of proving their own merits.

Mr. PALMER himself in the very beginning of his argument showed that his contention was sufficiently unsound. The common law, he said, "unjustly" handed over a woman's property to her husband, and so equity stepped in and redressed the grievance in a clumsy way by means of settlements. Now it is certainly a peculiar description of the attitude of the law towards a purely voluntary contract to describe the conditions which are attached to that contract as "unjust." The woman who has property is free to marry or not to marry as she likes; and, if she chooses to marry, the law, as Mr. PALMER confesses, gives her every facility for making her property safe, at the same time that it gives her, whether justly or unjustly, an almost unlimited claim on the property of her husband. It would seem that even Mr. PALMER himself felt the weakness of his case here; for he hastened to pass from the consideration of women of property to that of the case of the persons who are often poetically termed their humbler sisters. It was again unjust, urged Mr. PALMER, that a dissolute or drunken husband should be able to confiscate his wife's earnings. But here, too, his ill-luck followed him, for the Act known as RUSSELL GURNEY's has already dealt with this case; and all that Mr. PALMER could say against it was that it was difficult for poor people to avail themselves of it. The rest of his speech may be briefly described as occupied by an attempt to answer the objections which Lord PENZANCE, from an experience not to be matched by that of any man in the world, had urged against his plan, and by a singular anticipation of a golden age in which "married women "would soon begin to pay their debts out of their own "property." Mr. PALMER's adversaries might have made not a little capital out of this if they had chosen. For, apparently, he regards it as more than possible that at least some matrons will not attend to the rules of distributive justice in this manner, and does not intend to put any pressure on them to do so. In such case the old joke, "What's "yours is mine, and what's mine's my own," would have a pleasantly literal force as said by the wife to the husband. She would spend her money and he would pay her debts, an arrangement eminently satisfactory, at any rate, to Mr. PALMER's clients. Some of these things must have been present to the mind of Sir HENRY JAMES when he gave the Bill the remarkably lukewarm support on which we have already commented. The ATTORNEY-GENERAL thinks that the first clause was a matter "requiring very serious consideration," that the third clause needed to be "altered," that the seventh clause was one which "it would not be wise to pass." In short, his attitude was very much that of the legendary zoologist to the definition of "crab" as "a "little red fish which walked backwards." It was not a fish, it was not red, and it did not walk backwards; but otherwise the definition was admirable. Mr. PALMER's Bill was made up of clauses which required additions and alterations, or which were simply unwise, but the principle of it was excellent. Indeed the ATTORNEY-GENERAL said almost all that could be said against the Bill by remarking that, if it passed, it would be necessary to impose upon married women the burden of being made bankrupt. The picture of a British merchant at breakfast looking up from his *Times* across the teacups and remarking, "So I see you are in the *Gazette*, my dear," is one which may be commended to Mr. FRITH and other practitioners of domestic art. A good companion piece would be supplied by Mr. WARTON's creditable imagination of a wife turning her husband out of doors under Mr. PALMER's Bill. After this the debate languished, though many people will be found to agree with the extremely moderate remark of Mr. MORGAN LLOYD, another candid friend of this unlucky Bill, that the rights proposed to be conferred would "probably lead to a good "deal of litigation and domestic unhappiness." This consideration is probably below the notice of social scientists, but it will commend itself forcibly enough to others.

It is indeed rather difficult to decide whether propo of this sort, supposing that the proposers really int them to become operative, are more objectionable the point of view of social expediency or from point of view of that "justice" which is so frequent in their advocates' mouths. We do not remember that any of them has ever contained a suggestion that a husband should cease to be liable for his wife's maintenance, that they should (supposing her to be possessed of property) be jointly liable for the maintenance of their children, or that her authority to pledge his credit for necessaries supplied to the household should be in any way abridged. If this were done, the objections on the score of justice would be done away with, but the objections on the score of social expediency would remain. If anybody chooses to declare openly that matrimony is an unnecessary and obsolete institution, then the idea of temporary or lasting partnerships, in which each partner is free to dispose of his or her property as he or she likes and under-

goes no liability of any kind, becomes a logical and reasonable plan, at least in the abstract; for the working might not be quite so easy. But a marriage after the fashion of Mr. HINDE PALMER and his friends, in which community of interests is at an end, in which occasions for disunion and quarrelling—frequent enough as they are—are multiplied tenfold, and in which nevertheless no one of these occasions is recognized by the law as dissolving the contract, is about as uninviting an institution as can be imagined. It may indeed be said that these proposals, to round them off neatly, require an indefinite extension of the divorce law. Some zealots on the Continent have suggested that the incurring by the husband of any disgraceful legal censure shall be a cause for divorce. It is evident that, in the unions which the Married Women's Property Consolidation Bill contemplates, and in which sentimental mutual feelings are not likely to be common, divorce from a bankrupt wife ought to be allowed to any man whose commercial position is likely to be compromised. The elaboration of this principle should receive Mr. HINDE PALMER's earnest attention. Meanwhile it would be well if he and his friends would meditate on the very simple fact that the so-called injustices of which they complain are but corollaries of marriage as it has hitherto been understood, and are, after all, a cheap enough price to pay for the right of lifelong support without the necessity of toil. This, it may be said, is a very unsentimental view. But it cannot be said, as far as that matter goes, to differ much from Mr. HINDE PALMER's ideal of the wife who sues her husband and possibly leaves him to pay her tradesmen.

RISE AND DECAY OF BUDDHISM.

IN his *Lectures on the Reunion of the Churches*, reviewed some years ago in our columns, Dr. Döllinger observes that it is an oppressive thought that between four and five hundred millions of men—more than a third of the entire human race—profess a religion which connects with the doctrine of transmigration of souls the *Nirvana*, holding out to man, as his supreme end, a state of passive and otiose unconsciousness. There are indeed points of special interest about Buddhism besides the fact of its being, in spite of its almost entire disappearance from India, the largest, and, with the exception of Judaism, the oldest religion in the world. The many uncertainties about its history and doctrines, which will never probably now be fully cleared up, serve at once to stimulate curiosity. And if it is impossible to ascertain definitely from Buddhists themselves whether at the present time their religion does or does not recognize a personal God, we can hardly wonder at the various unsolved, if not insoluble, problems surrounding its origin and condition in the past. In the interesting paper he has contributed to the *Fortnightly Review* Mr. Edgar does not profess to do more than trace the main course of Buddhist development in India; but then he holds that "all known developments of Buddhism have been made in India," and that it has derived nothing of importance from the nations among whom it now prevails. One circumstance to which he constantly calls attention, and which has indeed often been noticed before, is no doubt very remarkable, however it may be explained, and that is the strange analogy in many respects between the history of Buddhism and that of Christianity, especially in its Latin form. M. Huc, the French Lazarist missionary, has even noted, in his *Recollections of a Journey through Tartary, Thibet, and China*, several curious similarities of detail between Buddhist and Roman Catholic ritual; but to such *minutiæ* Mr. Edgar does not refer, as neither does he seem aware of a still more startling coincidence, to be noticed presently, concerning the life of the founder of Buddhism himself, which is enveloped—naturally enough—in a cloud of legendary lore. The date of Sakyamuni is usually fixed in the sixth century B.C., and Mr. Edgar thinks it may safely be assumed that before the epoch of Alexander the Great such a personage did really appear in the lands lying near the junction of the Sone and the Ganges, who may not improbably have begun his public teaching at Benares, and spent the remaining forty-five years of his life in going about to preach from town to town according to the received tradition. It is anyhow certain—and here we come on the first striking resemblance to the Gospel—that his preaching was directed, not to any particular class or nation, but to all mankind. He seems to have borrowed from his Brahmin training the doctrine of transmigration, but to this he added the *Nirvana* theory, which can only be considered a kind of religious pessimism.

> His teaching seems to have been purely ethical, and not to have touched on either theology or philosophy. His secret was that existence in any form must necessarily be suffering, and not accidentally accompanied with suffering, as others had taught; in other words, that evil and existence are convertible terms. His method was that the only way to get rid of evil is to put an end to the desire of existence.

Or, as it may be expressed:—

> I.—All possible existence is suffering.
> II.—The cause of suffering is desire.
> III.—Suffering ends with desire.
> IV.—There is a way leading to the ending of desire.

The "way" was by sternly repressing, instead of seeking to regulate merely, those natural instincts which lead to the preservation, nourishment, and reproduction of life, so as eventually both to liberate ourselves from suffering, and from causing suffering to others, by the attainment of the complete *Nirvana*. But as this was too high, or at least too ascetic, a doctrine for the multitude, there was room found for an outer circle of "hearers," who followed a laxer code of merely regulative morality, "very similar to that which in our days satisfies the needs of modern Protestantism." And in this permission of a higher and a lower ethical standard Mr. Edgar traces an analogy to the observance of "the counsels of perfection" by Christian saints, while the mere keeping of the commandments by ordinary believers is held to require a supplementary purgatorial cleansing before the soul is fit for heaven. It may be questioned however if such an alternative rule is not, from the nature of the case, practically admitted under almost every religious system.

That after the death of Sakyamuni he should have soon become invested with a halo of mythical and superhuman glory was only to be expected. He was even alleged to have been born of a virgin mother, amid various signs and portents foreshadowing his great career. But the strangest thing about the legend, though it is not mentioned here, is that, under the name of "SS. Barlaam and Josaphat," it has found its way into the martyrology of both the Eastern and Western Churches, so that St. Josaphat—who is unquestionably identical with Sakyamuni—appears in the calendar, in the Eastern Church on August 26, in the West on November 27. Mr. Baring Gould says, in his *Lives of the Saints*, that Baronius adopted the story from St. John of Damascus, who first introduced it—in good faith, no doubt,—into Christian hagiology. Meanwhile it found its way into the *Golden Legend* of Jacques de Voragine and the *Gesta Romanorum*, and has been translated into most European languages, including the Icelandic, as well as into Syriac, Arabic, Ethiopic, Armenian, and Hebrew. A recent Roman Catholic writer, Mr. Nevins, has thus drawn attention to the strange coincidence:—

> The most amusing instance of the Saintship and invocation of a person who never existed is recorded by Max Müller, in his *Chips from a German Workshop*, vol. iv. pp. 175–189. Longmans, 1875. He without a shadow of doubt shows St. John of Damascus wrote a story called "Barlaam and Josaphat." The "Martyrologium Romanum" also says that he was the author. But this Barlaam and Josaphat is simply Christianized from an Indian source. St. John of Damascus has drawn the story from the "Lalita Vistara." It is really an account of Gautama Sakyamuni, better known as Buddha. It is an exact copy. Thus Buddha has become a Saint of the Church of Rome, under the name of *St. Josaphat*. In the Eastern Church the 26th August is the Saints' day, and in the Roman Martyrologium the 27th November.

Leo Allatius, Bellarmine, and Huet, the learned Bishop of Avranches, had their doubts on the subject, but felt bound nevertheless to accept the story of St. Barlaam and St. Josaphat as genuine. But it is time to pass from the life of Buddha to the history of the religion he founded, and in doing so we are at once confronted by curiously close resemblances, both internal and external, to the history of the Christian Church.

For the first three centuries the Buddhist, like the Christian, religion received no support from the civil power. But about the middle of the third century B.C. arose a prince, Asoka, who may be termed the Buddhist Constantine, and who moreover, like Constantine, delayed till the end of life his full acceptance of his new creed:—

> Each prince found that he had to deal with a powerful spiritual organization without any precedent to guide him; each saw the use that could be made of the organization as an engine of government, but saw as well the danger of its overshadowing the temporal power. It was, therefore, the aim of each to get the control of the organization indirectly, and, as it were, from outside; and not to compromise his position as an all-powerful friend and patron by taking the final step which might bring him within reach of spiritual discipline. But apart from the political aims, each prince had undoubtedly from the outset a real admiration for the beauty of the religion and the noble lives of its professors, and when old age came on, with disappointment and remorse, this feeling ripened into a true conversion in each case.

Thenceforth the Buddhist Community or Order—for a great quasi-monastic Order was the ruling power—began to grow and spread. Stately monasteries arose everywhere, and a metaphysical spirit showed itself, corresponding to the theological movement in the Christian Church. Its tendency however is declared to have been "undoubtedly towards a reasoned atheistic materialism," traces of which may still be found in the Buddhism of Ceylon and Burma. But meanwhile the popular craving for a more concrete and visible cult was satisfied by a multiplication of relics and images of Buddha and his principal disciples. Asoka also gave the impetus to missionary enterprise, and extensive conversions followed. But the writer repeats the conviction he expressed at starting, that Buddhism can receive no doctrinal development except through the Hindu mind, while in India it showed a strong power of development and assimilation. He thinks however that a disproportionate stress has been laid on the metaphysical, or quasi-theological, side of the system, which may be compared to the mediæval scholasticism. One of its greatest masters was Nagarjuna, whose speculations appear to have been purely sceptical, but who professed to have discovered a supplementary revelation, contained in a number of new Sutras or "Vapulya." But throughout the history of Buddhism we are struck with the overwhelming importance and authority of "the Order," and Mr. Edgar thinks that, with the possible exception of the Roman Catholic Church, no religious organization in the world has been so strong, or played such a part

in the development of doctrine, as the Buddhist monkhood. And yet there have been divisions which remind one more or less of the Protestant Reformation:—

> At the same time there were two main schools of thought and practice, as much opposed to one another as Calvinists and Arminians, or rather as Protestants and Catholics, are with us, but still each acknowledging the other to be Buddhist. The earlier of these and the least removed from the original teachings of Sakyamuni was dominant in Ceylon and the outlying countries towards the Oxus, while the developed doctrines of the Great Method had taken firm root in Hindustan and the neighbouring countries of India, and had its rise in the great group of monasteries at Nalanda. To the adherents of this school the three precious ones—Buddha, his law, and his Church—were still the bases of all the superstructure. Their Buddha was still a finite being, who, through countless transmigrations by a continued course of right-doing and thinking, had worked up to the knowledge of the way of salvation which he had embodied in his teachings and bequeathed to his Church; after which he had gone into the complete Nirvana, and to all intents and purposes had ceased to be. But he was only the last of a series of Buddhas whose careers had been in all respects like his, and he was to be followed by a series of Buddhas without any conceivable end, many of whom had already reached the state of fitness for Buddhahood, and were only waiting for their turns to come in the evolutions of phenomenal existence. The supreme secret which some of these beings had found, which others were seeking, and which all desired to reveal, was the knowledge of the absolute unreality of everything, even of themselves, and of the knowledge that they were to teach; but this was somehow mixed up with a tendency to treat something as a real underlying substance, and this thought seems to have been coloured by the materialism of a preceding school; and so in some way Prajna the knowledge, Dharma the law, and the metaphysical idea of intelligent matter, had got mixed up and personified possibly by a female Bodhisatva, who, to those unversed in philosophy, became afterwards the source of all things, even of the Buddhas themselves.

The metaphysical was followed by the mystical stage of Buddhism, initiated by Aryasangha, who appears to have made such considerable changes or additions to the creed that it was thought necessary to authenticate them by appealing to a second supplementary revelation from Buddha, contained in four treatises. And from the results of this mystical movement, "a kind of Buddhist Gnosticism," which "by substituting faith for works prepared the way for antinomianism," Mr. Edgar traces the moral decline of the system.

There was, however, another and more deleterious influence at work, originating, he supposes, in a powerful non-Aryan State which had adopted this form of faith. A species of Nature-worship, essentially impure and quite out of harmony with the ascetic basis of the Buddhist creed, began about the eighth century to be mixed up with it. The process was sufficiently incongruous, but by that time Buddhist mysticism had reached the stage when religious exaltation is apt to shade off into sexual prurience; and it is at all events certainly a fact that "the mountain god was identified with the Buddhas of meditation, and his wife the mountain tarn became the 'wisdom' of the mystics, while the magical and debasing ritual of the hill deities was transferred with an esoteric and symbolic meaning to the worship of the heavenly Buddhas." And this led up, by an internal development, to the fourth or theistic phase of Buddhism, which is generally, but Mr. Edgar thinks wrongly, ascribed to Brahminist influence from without. He adds that the downfall of the religion in India was certainly not caused, as is also commonly affirmed, by Brahminist persecution, for the Buddhists and Brahminists had lived together on friendly terms till the creed of the latter was destroyed by the Mussulman irruptions of the eleventh and twelfth centuries. But if this be granted, it still does not explain why the Moslems, who did not convert more than about a sixth of the Indians to their own faith, should have destroyed Buddhism and left Brahminism in full vigour. The internal causes both of the rapid growth of Buddhism, with its seemingly repulsive doctrine of absolute self-effacement, and of its hardly less rapid decline in India, are in fact left wholly unexplained. The analogy of doctrinal development in Brahminism and Latin Christianity is no doubt remarkable, but here too Mr. Edgar's statement is not quite accurate. He points out that while each had a body of authoritative Scriptures, there was this difference—that "the revelation of Buddha was final," leaving it to be inferred that the Latin theologians laid claim to a continuous stream of revelation. But they have always in fact disclaimed such a view, though their opponents have sometimes charged them with it, while on the other hand he had himself shown that both Nagarjuna and Aryasangha did appeal to supplementary revelations of Buddha. However he considers "the more elastic system of the Latin Church much the safer of the two," inasmuch as we can hardly conceive an Ecumenical Council reversing all the dogmas and teachings of Christianity, while something like this was the effect on Indian Buddhism of the supplementary revelation of a Supreme Deity contained in the Kala Chakra; after which last development "the work of pollution went on merrily." Yet it must not be forgotten that, in spite of these moral corruptions, which are unspeakably vile, the purer ethical teaching of Sakyamuni has never been wholly lost. The difficulty is to understand how, with an "Order" so powerful, and which seems all along to have retained a sense of continuity and of obligation to its solemn trust, so widespread and deep a debasement should have been possible. We cannot wonder at Frederick Schlegel speaking of "the indescribable confusion" of the system. Meanwhile many of those likely to be best informed believe, as a writer in the current number of the *Edinburgh Review* has pointed out, that in a generation or two Chinese Buddhism, as well as Indian Brahminism, will succumb to the active propagandist tendencies of modern Islam.

SOCIAL RECIPROCITY.

AMONG the many overrated pleasures of childhood was the receipt of a hamper at school. It is true that we used to anticipate its arrival with anxiety and interest, nor can we deny that we felt satisfaction on its safe appearance, and derived some gratification when devouring its contents; but it brought its cares as well as its pleasures. When we sat proudly at the breakfast-table with a ham, a tongue, and several pots of jam and marmalade in front of us, before we had time to taste any of these luxuries ourselves we used to be embarrassed by a number of little notes from all parts of the table. We quote one of these as a specimen of their general import. "You owe me some prog for what I gave you. (Signed) TOM SMITH." Such epistles may not have been very delicately or politely worded, they may have been more laconic than elegant, and they may have been rather subversive of the conventional methods of adult hospitality, but they taught us a useful lesson in the first principles of entertaining. It is an unpleasant idea, but it is not the less true, that the first law of society is bluntly laid down in the urchin's letter. "You owe me some prog for what I gave you" may be said to be the primary element of dinner-giving. We have now entered upon the great hamper season of London life, when, instead of enjoying our meals in private, we must either divide our own food with others or get them to repay what they owe us. There are certain religious orders which devote a large part of their time to almsgiving and begging; and we are sometimes inclined to think that people who are, as it is called, "in society," must be affiliated to one or other of these communities. Their principles are, indeed, exactly the opposite of the mendicant friars, as they feed the rich instead of the poor, and only give to those from whom they expect to receive again; but, nevertheless, they live on the food of others, and distribute their own bread among strangers. The most approved duties of good society appear to be precisely the reverse of those of the first, "that eldest was and best," of the inmates of the "Holy Hospitall" in the *Faerie Queene*:—

> His office was to give entertainement
> And lodging unto all that came and went;
> Not unto such as could him feast againe,
> And double quite for that he on them spent;
> But such as want of harbour did constraine:
> Those for God's sake his dewty was to entertayne.

Those "that needy were and pore" would be the last likely to be troubled with cards of invitation during a London season. It is true that the rich give money to be spent on providing food for a limited number of deserving poor, but they expect them to give payment for every pound of flesh in at least sixteen ounces of pious gratitude.

We have to pay, in one form or another, for most things that we receive in this life; but there are few things which are so essentially purchased, bought, sold, and paid for, as the hospitalities, civilities, and amenities of society. There may be some cases in which these advantages are not paid for in kind, but paid for they must be in some manner. Many ladies keep something very like a regular debtor and creditor account of their dinners given and received. A debt may be occasionally repudiated, but such a course of action is only followed by members of polite society when they do not intend to "deal at that shop again." No tradesman forces his custom with greater pertinacity than do the *parvenus* of society. They leave cards and send out invitations to dinner on the faintest possible pretexts, and they advertise their hospitalities, and, indeed, their very existence, in ways that are but little less flagrant than the placards recommending the use of an article known as the "liver pad." Like the quack doctor who used to appear at country fairs accompanied by a black drummer or a Highland piper, the society-monger engages the latest musical curiosity to attend his *séances*. Even the company provided is arranged with a careful view to future repayment. Those who are likely to provide dukes at parties to come have dukes now provided for them; those who are unlikely to offer anything better in the future than brand-new barons, have like articles now set before them. As to those who merely deal in commoners, they need expect nothing better when dining with others. Most people have acquaintances of various descriptions. Even the greatest in the land do not mix exclusively with their compeers, and, generally speaking, they sort their visitors as they would their bills, their invitations, or their business letters, and they take care that like shall be put with like. What is commoner than for people to feel themselves in the seventh heaven of happiness at receiving an invitation to the house of some great personage, and then to be mortified by finding that they have been asked to meet fellow-guests to whom they would have taken serious exception in the house of an equal? It may be broadly laid down as a rule that the invitations of very great people are of all invitations the most mercenary, for they generally have so many acquaintances to choose from that they become chary and exclusive in selecting friends, and they acquire the habit of drafting off every one to whom they are introduced as either useless, useful, or possibly useful, and accordingly throw them altogether on one side, make use of them, or keep them in reserve in case of emergency. Three-fourths of the people who crowd the parties of grandees are regarded by their hosts and hostesses much in the light of upper servants whom they may command to do their behests as occasion may require. One is a useful canvasser; another subscribes liberally to a favourite charity; that man furnishes the freshest of gossip

whenever required, and this man is excessively useful in racing matters. The greybearded man is distinguished for his literary attainments, and he collects a few presentable authors for the great man's parties, so as to keep up his reputation as a patron of literature; and the red-whiskered man does the same sort of thing in the matter of artists. The beauties are asked just as dancing girls are hired by Eastern potentates, the handsome men serve much the same purpose as good-looking footmen, and the attachés are simple automatons, signifying the intimacy of the host with the foreign Embassies. Mr. A. has been invited to please Mrs. B., who it is believed will be able to induce Mr. C. to take into his wealthy firm Mr. D., who was formerly a tutor in the family, and Lady E. has been asked to come merely to annoy Lady F., who is a pet antipathy of the hostess's.

It is very uncommon to find such an error made in social account-keeping as a dinner party repaid by a drum. It may be said that there are drum acquaintances and dinner acquaintances, luncheon acquaintances and simple card-leaving acquaintances. It seems to us that the highest refinement of social reciprocity is attained when such a small and inexpensive thing as a card is repaid by exactly so much cardboard, and no more. Now and then accidents will happen. An amiable hostess, when reading the advertisement sheet of the *Times*, observes, "Dear me, Lady Foie-Gras is dead; and she owed us a dinner!" The immorality of dying with unpaid dinners upon the conscience is obvious. If it is announced that a giver of princely entertainments is seriously ill much genuine sorrow is expressed; but it is of the following nature:—"Stupid old man! why should he be ill during the season? Why did he not wait for the winter?" There are certain social deceivers who give a sort of verbal I.O.U. in return for London hospitalities. They hint at invitations for shooting and balls at their country houses in the autumn, or else they leave town before the season is half over and pretend that they are coming back in a week or fortnight. They remind us of the description given by an undergraduate when under examination, of the promise of the good Samaritan:—"'When I come again I will pay thee all things.' This he said well knowing that he should see his face no more." The fortnight passes, and then the promised host is detained by unexpected business in the country. The winter passes, and, when he reappears with the spring in London, he expresses regret that the death or illness of a near relation, the exceptional scarcity of his game, or the bursting of his tank, unavoidably prevented him from filling his hospitable mansion with the relays of charming guests which he had hoped for. Another type of dinner-stealer is the man who asks us, the second time we meet him, to go down to stay with him for two days' pheasant-shooting in October. He will take no denial, and, although so long beforehand, he insists on booking us for a certain day. He is staying at an hotel, and we feel that the least we can do is to invite him to dinner. On inquiry, we find that his happy hunting-ground is wretchedly stocked with pheasants, and that it is situated in the heart of Wales, ten miles from a railway station; so we feed him first, and then have to scramble out of our engagement to stay with him as best we can. There are other wicked subterfuges resorted to by the dishonest. Short invitations at the height of the season when people are pretty certain to be engaged for every night during the following fortnight, invitations at the end of the season when the invited are likely to have left London, invitations for nights on which the kind host has heard that the guests he invites are themselves going to give dinner parties, and many other mean artifices are stooped to by people who, from their position and breeding, ought to know better. It must not be supposed, however, that all the guests at a London dinner party are expected to offer food in return for what they consume. There are dowagers who have been asked in order to give an air of respectability to the entertainment on the strength of their titles; there are "amusing men" who are to pay for their dinners by "making the party go off well"; and there is a bachelor who owes his invitation to his presence being required at short notice, in order to prevent the number of diners being thirteen. Furthermore, there are some young married people and stupid young men who, though unable to entertain at present, will be very rich some day, if they live. Such as these are now fed on the understanding that they are to feed again *post obit*.

To buy a bad horse is a terrible calamity; but to buy a bad dinner is, for the time being, almost worse. We do not refer so much to having bad wine, bad food, and bad cooking given us in return for our own more or less excellent dinners; but we are thinking of occasions when people who seemed charming when we met them at the houses of others have repaid our own well-selected parties by asking us to meet bores, prigs, or pomposities. Cannot most of us recall entertainments at which we have sat between women who seemed endeavouring to outvie each other in stupidity and dulness, and have we not wished that our hostess would have given us an opportunity of doing better justice to our conversational powers? On the whole, however, we must admit that entertainments are pretty fairly purchased and repaid as a general rule. In social merchandise people may expect to receive their own again, but that is all they are likely to get.

A STUDY IN ETHICS.

THE long and sometimes, it is to be feared, idle dispute as to the causes of the late Liberal triumph resulted, as all men know, in one conclusion only—at least for the victors. "A people constantly growing in attainments, in knowledge, and in virtue," could not away with such a Ministry as Lord Beaconsfield's, and accordingly put Mr. Gladstone's Ministry in their place. This fact being ascertained on the very best authority, there is little left for any member of this model nation to do but to make the most of his opportunities. A Ministry which has been chosen under such circumstances must of course be a pattern of conduct, and a great authority has told us that conduct is some considerable fraction—we forget exactly what—of life. Therefore he who wishes to live must know how to conduct himself, and he who wishes to know how to conduct himself has nothing to do but to study the ways of the existing occupants of the Treasury Bench. The duties of a Ministry are so various that their public conduct really brings out most of the motives and manners of acting which prevail in the daily affairs of other men, so that the pattern is really one of sufficiently general applicability. By observing the behaviour of these elect souls towards their enemies on the other side of the House, the ardent youth of England may learn how to treat the viler specimens of humanity with whom, it is greatly to be feared, they themselves will at some time or other be brought in contact. By watching their attitude towards their followers, their servants, and the servants of the public, the problem—almost equally difficult—of behaviour to private friends and associates may be solved. It is an instance coming under the latter head which we propose to take for immediate contemplation, and it will surely go hard but edification will come out of it. The behaviour of the Government in the matter of Sir Bartle Frere is an interesting study in ethics; and as it has to be pieced together out of a considerable number of transactions and incidents, there is just that element of difficulty about the investigation which attracts the true student. It is all the more worth attempting because the Ministers themselves, with the modesty natural to good men and inculcated by the greatest masters of conduct, are a little reluctant to flaunt their actions in this matter too openly before an admiring world, and indeed have to be, in a vulgar phrase, "drawn" with much skill and pertinacity before they confess their acts and intentions.

It is not necessary to preface the study by a too lengthy account of the situation as it was when the Government first became responsible for it. They—speaking of them as a body, and including those adherents who have carried them to power—had made of the deed or misdeeds of Sir Bartle Frere in South Africa one of the stoutest of the crowbars with which they succeeded in bringing down the house of their predecessors about their ears. The poor Zulu figured continually with the guileless Afghan, the tortured defender of his country, the misburied Dissenter, the noble, thwarted Russian, and the swindled Turk, in the singular group of bogies arrayed for electioneering purposes. Of the justice of this condemnation of Sir Bartle's acts, and of the Government which, disapproving and in a manner disavowing them, did not think proper to recall him, there is no need to speak. All this is ancient history, and was amply dealt with at the time. The earliest event of what we may call modern history is that the persons who had severally or collectively used this language, or allowed it to be used, came into office and decided to retain the services of Sir Bartle Frere. Here also we have no opinion to offer as to their conduct. We have obligingly fixed a great gulf between persons "out" and the same persons "in." Besides, it must be remembered that, on the soundest principles of philosophy, the action of Mr. Gladstone and his friends was justifiable. There is no more venerable maxim than "Cessante causa cessat et effectus." The cause of these gentlemen's excitement against Sir Bartle was their desire to turn out the Government of Lord Beaconsfield. This cause having in the fullest sense ceased by reason of its complete gratification, the effect—the indignation against Sir Bartle—naturally ceased likewise. The argument is invulnerable, and we are happy in making a present of it to the Ministry as an early expression of appreciation and esteem. But there was, as it happened, a considerable number of persons who were deaf to logic. Indeed it is a sad characteristic of the Parliament of Great Britain that it always contains a large number of persons who are deaf to logic. To these the conduct of the heaven-born Ministry appeared singular. Such of them as were Tories, with their party generally, had of course nothing to say, though doubtless they thought the more. It would have been brutal to find fault with the graceful compliment paid them by the complete adoption of their own views, or at least of their own practice. But the malcontents on the Liberal side were less patient. Loud was the wail of the Radical press, frequent were the caballings of indignant members in lobbies and tea-rooms and rooms of all sorts and kinds. Now, as even a Ministry of all the Virtues might have found it a little awkward to be saved from their own followers by their adversaries on a point on which they had themselves just turned those adversaries out, it became necessary to do something. "Then, indeed, Mr. Gladstone, the wise member for Midlothian, devised a fresh dodge," as his favourite bard would put it. By a curious coincidence, Mr. Chaplin quite guilelessly, and in reference to another matter, had reminded the Ministry in the early part of the evening of Tuesday, May 25, that in the stable of one of their own colleagues there was "a filly called Evasion." A little later in the night it became clear that the Duke of Westminster's chief had a valuable beast of the same class in the stable of his brains. In a speech long even for him, and even for him involved, Mr. Gladstone hinted a most singular way out of the difficulty. Sir Bartle Frere was to be kept in Africa "in respect of the prospect of Confederation," and in a little time there was no knowing what was to be done. The tittle-tattle which

always gets abroad soon let it be known that this mysterious utterance in public had been attended with still more mysterious utterances in private to the malcontents, and that Sir Bartle was "as good as recalled."

Here let us indicate the first important point in our study of ethics. It need only be indicated, and by way of comment a curiously parallel incident which we read not long ago in a novel will suffice. A shabby baronet had a land steward whom he wished to turn off. But the shabby baronet was at the time engaged in having his farms revalued, or in some similar occupation in which the steward was indispensable. So, said the shabby baronet to his shabby wife, "I can't give him notice just now; let him finish his work, and then he shall go." To resume the narrative, it soon appeared that even these mysterious and tempting, if not exactly magnanimous, offers of possible surrender did not satisfy the malcontents as a body. They still held meetings; they wrote letters to Mr. Gladstone by which, probably for the first time in his life, he is said to have acknowledged that he was "embarrassed," and they made vague but unpleasant threats of opposition on the Estimates. Here the Homeric refrain comes in again, and Mr. Gladstone and his colleagues ἄλλ' ἐνόησαν for the second time. A mysterious announcement was made that no salary for Sir Bartle would be included in the Estimates. Five hundred pounds had been taken on account by the late Government, and the present Government did not intend to ask for any more. Here, again, it became necessary to ask what it meant. It appeared to mean that the Ministry, in strict accordance with the curious handsomeness of their previous conduct towards Sir Bartle, were going to take out of him the five hundred pounds' worth, and then to "strip him of his livery," as our rude ancestors used to say and do. Ministerial organs even hailed the incident as a proof that speedy recall was intended, and a sign that "the Bartle Frere difficulty was at an end." But certain partisans on the same side, either innocently or maliciously, pointed out that the immediate effect was something quite different. With the disappearance of the vote disappeared the possibility of questioning the policy of the Government. The "filly called Evasion" had been entered again at the last moment; and, unlike her namesake, had apparently won, hands down. But her rider had not yet "scaled"; and Mr. Grant Duff, in the character of jockey, had to go through this unpleasant process on Tuesday last. A more ludicrous and painful scene has not occurred, even in the present House. First, Mr. Grant Duff had, after a pause, to confess and avoid, or at least to postpone, an answer to Sir Wilfrid Lawson's demand as to the loss of his opportunity; then, with still more hesitation, he had to confess to Mr. Courtney that the reason just alleged for stopping the salary had been in full force when the Estimates were placed on the table by the late Government, and therefore when the Government came into office and all along. Poor Mr. Grant Duff put Sir Wilfrid off to Thursday, but the comedy hardly needed prolongation. Nor, when Thursday came, did the explanations which were given in both Houses mend the matter. The soreness which Lord Kimberley and Lord Granville both showed in commenting on Lord Carnarvon's question was the best evidence of their discomfort. Perhaps Lord Kimberley's remark that the Government had graciously told Sir Bartle that, "if he had incurred any expenses which he thought might be chargeable" on the future, they should be "considered," was the most fatal admission that could be made. For either Sir Bartle is entitled to his salary, or, not being entitled to it, he certainly does not deserve to have his speculative anticipations considered. As for Mr. Grant Duff, he is said to have remarked that it was proposed "to print a fresh page of the Estimates." A fresh page would indeed be a convenient thing for the Government in the whole matter.

So then we may gather up the lessons of this little history which we have endeavoured to relate with scrupulous accuracy. A body of English gentlemen decide that a public servant is of sufficient worth and value to be solemnly adopted, and his cause espoused, despite some antecedent difficulties. Finding that this excites discontent among their supporters (a discontent for which they must have been fully prepared beforehand), they plead that he can be made useful for a particular purpose, and turned off when that purpose is served. This not proving a strong enough inducement, they hint that perhaps they will turn him off very soon indeed, if they are left uninterfered with. This again failing, they adopt a course which is in the first place open to the charge of sordid meanness, if not gross unfairness, and which on further investigation appears to have been adopted mainly for the purpose of saving themselves from the unpleasantness of an inconvenient inquiry into their conduct. No termination that the incident can have will in the least alter these facts, which are unfortunately, as we have said, matters of history; and if we were considering the subject from any but a purely philosophical and studious point of view, we are afraid that we should have to be careful as to the epithets applicable to the whole transaction. When Montesquieu came to England, he found to his surprise that the word "Jesuit" had a definite metaphorical connotation. "Cela est jésuitiquement faux" was, he tells us, a favourite phrase, and it seems to have been then a new one, common as it is now. When the Bartle Frere incident has been repeated a few times, perhaps the term "Liberal" may obtain a similar secondary sense, and people will say "that is liberally shabby"—a confusion of terms much to be deprecated. It has, however, been sufficiently hinted already that the business of plain men with the present Government is not criticism of this audacious sort. We are in the position of Mr. Tennyson's amiable young lady—"we cannot understand"—but we are none the less bound to "love." Fervent admirers of Mr. Gladstone have contended that his extraordinary fancy for humiliating himself and England is because he is so very "proud." Perhaps the apparent shabbiness of his recent conduct is due to the fact of his extraordinary magnanimity. These speculations, however, are too high for any one but a professor of moral philosophy, and the present study is only a humble contribution of material to the labours of such a one when he attempts a *Kritik aller möglichen—or unmöglichen—Ethik.*

THE *AGAMEMNON* AT OXFORD.

THE Summer Term, the "sweet hours and the fleetest of time" of which Mr. Lang has lately been singing so pleasantly, has been this year enriched by a new emotion. Everybody at Oxford has been going mad, not about the river and the cricket-field, nor even about the flower of the chestnut and the bouquets "purchased of Bates," but about Æschylus and the *Agamemnon.* What neither examinations, nor prizes, nor lectures, nor exhortations have been able to do has been done by means of a discovery made by the undergraduates themselves—namely, that a Greek play could be acted, and that its characters were really intended for human beings and not for shadowy abstractions. Since this fact was borne in upon the men an extraordinary revival has taken place in the study of the Greek drama. The Oxford booksellers have sold out all their copies of Æschylus, which have found their way to all sorts of unfamiliar places. The quiet rubber has been commuted for discussions about the functions of the Chorus; in the walks of Magdalen, even in the punts on the Cherwell, which had never carried any literary ballast heavier than a yellow-backed novel, the hardest of Greek dramatists has been found to be the undergraduate's closest companion. Oxford ladies—for as yet the Higher Education has not had time to make Greek universal among them—have been studying rival translations, and debating the merits of Lord Carnarvon and Dr. Kennedy, Mr. Morshead and Miss Swanwick. In fact, the curious phenomenon has been witnessed that, while in and about the Congregation of the University the attack on the compulsory study of Greek has been developed with alarming vigour and with every prospect of success, the overpowering charm of Greek literature has spontaneously asserted itself in a manner that no one could have foreseen, and with a force that may really affect the future of the study.

The interest came to a climax on the evening of June 3rd, when the new and spacious hall of Balliol College was crowded with an audience that contained all Oxford and some part of Cambridge, with a few such Æschylean students as Mr. Browning and Mr. Newton from outside. At the end rose the front of the Palace of the Atridæ, painted by some of the undergraduates from a sketch, we believe, by Mr. Burne Jones; and in front of this the whole action was to take place, of course without change of scene. We may be allowed to recall in a few words the outline of the play, familiar as it is to many. It opens with the old watchman taking his station on the battlements, and complaining of his ten years' fruitless vigils; for the beacon-fires that are to tell of the fall of Troy are looked for in vain. As he speaks, the beacon flames out; and with cries of astonishment and delight he disappears to bear the news to the Queen. Then enters the Chorus in procession, singing the long and magnificent ode which tells the story of the departure for Troy, and which lingers with unconscious foreboding of ill on the sacrifice of Iphigenia—that sacrifice which Clytemnestra afterwards makes, or pretends to make, the motive of her crime. During the choric song the Queen comes in, and announces what the beacon fires have revealed; and, soon after, the doubts of the Chorus are set at rest by the arrival of a herald, who, after a touching salutation of his fatherland, unseen for ten years, tells of the approach of Agamemnon. The Queen, re-entering, bids him carry back her wifely salutations to the hero; and, after another choric song, the King enters, riding in his chariot with his captive Cassandra, "the flower of the spoil," awarded to him by the general voice of the army. In a long speech Clytemnestra greets him, dwells on her hardships during his ten years' absence, protests her devotion to him, and bids the maidens lay down purple trappings before him, that the feet which have trampled on Troy may touch no common earth till they have entered safe into the palace. The King, a true Greek, is unwilling thus to incur the divine jealousy; but he is over-persuaded, and, while the Chorus shrinks back in dread, he steps on the trappings which are to prove to him a web of death. When he and the Queen have passed into the palace the interest is transferred to Cassandra, whose alternations of sad lament and raving prophecy, met by the pitying incredulity of the Chorus, make up the most astonishing scene in Greek tragedy—perhaps the most astonishing scene that exists in dramatic literature. She passes in to her doom; and, a moment after, the death-shriek of Agamemnon shows the truth to the still doubting Chorus—only to be convinced when the drawing back of the curtain reveals the figure of Clytemnestra, with axe upon her shoulder and "the dark dew of blood" upon her brow, standing triumphant before the bodies of her victims. She avows the deed; it is "the crisis of an ancient feud"; it is the working of the old curse that has been brooding over the house of Athens; it is the Alastor of the Thyestean banquet, and of Iphigenia's sacrifice; she has but worked out the decree of fate. With such avowals and such excuses, met by the bewildered half-assent of the Chorus, which is at last roused to wrath and some semblance of determination by the appearance of the hated Ægis-

thus, the play ends, and the spectator is left to wait for the vengeance which, he well knows, is to come upon the murderers at the hand of Orestes.

It is plain that to achieve with success the untried task of representing this play on the stage in the original language is a difficult feat; it is a feat which till last week most people would have thought impossible. The actors have to create not only their characters, but their atmosphere, and not all the traditions of Oxford can make the atmosphere of an English stage anything else than unlike the atmosphere of Argos or of Athens. And yet it is not too much to say that from the moment Mr. Courtney crossed the stage and took up his position on the palace roof, to the moment when the Chorus marched away singing its song of vengeance, the audience in Balliol Hall was under the spell of a complete illusion. The beauty of the dresses (contrived chiefly, we believe, by Professor Richmond), the solemnity of Mr. Parratt's quasi-Gregorian music, the stately presence of the King of Men, the statuesque bearing of Clytemnestra, the charm of Cassandra's voice, the fierce, tyrannic strength of Ægisthus, all combined to present a whole which, in spite of certain obvious faults, was stamped from the very first with the seal of success. There are no two opinions about this; the only debate—and it has sometimes waxed warm among partisans—is as to which part was the best and which the less good. Oxford dinner-tables have been for the past week amusingly divided between Clytemnestrians and Cassandrites; between adherents, that is to say, of Mr. Benson, who played the Queen, and of Mr. Lawrence, who played the captive princess. It is true enough that Clytemnestra here and there forgot the rhythm of her iambics, and uttered words in impossible combinations; but faults that would be inexcusable in a short address may very well be pardoned in a long play, where, moreover, not one-tenth of the audience were likely to detect that anything was wrong. In the presence of that superb figure of the Queen, pronouncing with worthy gestures and with the true tragic note the fulfilment of her vengeance, one does not much mind a spondee in the fourth place. Cassandra, again, might perhaps have gone further than Mr. Lawrence went in the direction of prophetic *enthousiasmos*; but if she had done so, an English audience might well have mistaken it for rant, and the actor certainly erred on the safe side if he erred at all. Perhaps, too, another week's training might have brought the Chorus to a higher pitch of perfection—especially in the way of grouping—than it had attained. It is in this matter of grouping their choruses that the actors at Ober-Ammergau specially excel; but then the actors at Ober-Ammergau have a vast stage to group themselves on, and the Oxford actors had but the end of a dining-hall. This limitation of space brought other drawbacks with it; for example, Agamemnon's death-cry was uttered just behind the small curtain, instead of "in the recesses of the palace"—a difference that made the indecision of the Chorus seem still more fatuous and absurd.

> Are we diviners, to conclude from groans
> That he who uttered them is really slain?—

so Professor Campbell renders the question of the Fifth Argive; a question that might be asked if the groans had come muffled by distance, but that seemed the pitch of imbecility as they were uttered with appalling realism from close by. Again, that Clytemnestra should turn and as it were gloat over the bodies while the Chorus sang its ode seemed to many spectators to be contrary to Greek feeling; but here, again, the practical difficulty of want of space may have been the reason. The Queen must do something during that interval; and what else on those narrow boards could she do?

The play was repeated next day at Balliol, and we are glad to hear that it is being given again at Eton, Harrow, and Winchester. We wish all success to the actors in their bold attempt to bring home the power of Greek to places where for the most part Greek is not thought kindly of. Certainly, if the Greek drama was to be revived, it is right that the first trial should be made with the *Agamemnon*. The piece has indeed one fault—the uncertainty which hangs around the motive of Clytemnestra; but, except for this, it stands unquestionably at the head of all Greek plays. None can compare with it in splendour of language, in dim, mysterious elements of terror, in the effect which is produced by the tragic contrast between Agamemnon's triumph and his fall. Above all, in no other do we find a Cassandra; surely the most touching figure that ancient pencil ever drew. We cannot but be grateful to the young men who have given us the opportunity—never given before in modern times, we believe—of seeing and hearing these characters and these situations and this language with our eyes and ears. They have given to many persons much matter for reflection; have suggested, for instance, such questions as these:—Is there so much difference between the Classical and the Romantic drama as the critics would have us believe? And, if you wish to make people care for a language and a literature, is it not the best way of proceeding to show them that the language and the literature have a living force and a human interest?

FEATHER AND FUR.

THE present extraordinary attempt to place the question of ground game on a satisfactory footing is really the consequence of Conservative neglect. Had the late Government during their six years of office dealt with the farmers' grievances as they ought to have done, they would have been spared a proposal which has already aroused opposition in the minds of men who have not ceased to be owners and sportsmen because they are Liberals. "The feather to the landlord and the fur to the tenant" is doubtless a neat and well-turned epigram. It may sound admirably on the platform, and win many votes from electors who hardly know a grouse from a partridge. It is positively charming in its simplicity; but how it is likely to work in practice we propose now to discuss. We speak from considerable experience, and have every sympathy with farmers struggling against bad seasons, high rents, foreign competition, and excess of four-footed game; while we have none whatever with careless landlords who will not recognize stern facts, and who lease their shootings to gentlemen whose idea of sport consists in incessant file-firing varied by sumptuous hot luncheons, instead of sandwiches and a glass of sherry. But we are quite prepared to show that the proposal of the Home Secretary, besides being very questionable in principle, will in practice excite much more annoyance and irritation than already exists, and must in many counties put an end to all good understanding between occupiers and owners.

Hitherto, by sensible and practical landlords, all need for coercive or prohibitive legislation has been anticipated in one or more of the following ways. The owner effectually shoots down game of all kinds, himself or by means of his keepers and trappers, rears and feeds his pheasants, leaves just rabbits enough to prevent the foxes from making inroads on the poultry-yard, allows every tenant, great or small, a fair share of the game which he shoots, and invites such of them as can handle a gun without endangering the lives of their neighbours to join him in a day's shooting. Some landlords, who have more acreage than they can manage, concede to sporting tenants the right of shooting all kinds of game for a moderate sum. A third course is to grant the farmers the privilege of coursing hares and of killing rabbits by means of nets, ferrets, and traps, at certain periods of the year, let us say between November and March. This concurrent right, to our knowledge, has worked admirably. If under it rabbits increase too rapidly, it is the farmer's fault. The feathered game is not made wild in the shooting season by constant gunnery, nor disturbed by the farmer and his "authorized agent" at the period of incubation. A fourth remedy is for the tenant to claim damages from the owner or lessee on account of over-preservation, and round sums have been paid for such injury to crops. But wherever there is a good understanding between the farmer and the owner or his shooting tenant, we can assert that no difficulty has been experienced in removing all ground of complaint without any recourse to law or to arbitration. It may naturally be urged that the proposed Bill, after all, only follows the practice which has hitherto been adopted of their own accord by these equitable proprietors; and that it ought, in consequence, to be welcomed by all parties as a fair settlement of the question. But there is an enormous difference between a mutual adjustment of a vexatious dispute—protected by necessary safeguards, and fitted to the changing circumstances of each county or estate, to the moor and the woodlands, as well as to the arable and pasture—and a rigid principle imported into a Bill, and ultimately invested with the force of an Act of Parliament. The latter is, by its very nature, hard and unbending. The former is elastic, and capable of contraction or expansion according to the interests of the parties or the physical exigencies of each tract of country. It will be sheer mockery to talk about good feeling and concession and forbearance when the Legislature has deliberately invested a sturdy farmer with a right which he cannot alienate, and must therefore enjoy and work to the full.

And now as to the probable effect of this remarkable Bill on each of the parties concerned. We can scarcely conceive that its framers have had any practical acquaintance with legitimate sport. Possibly they imagined that the farmer and the landlord, or his lessee, would meet amicably on a turnip-field or at the edge of a big wood, and after grave salutations agree not to spoil each other's sport. The occupier, invested with the new inalienable privilege, would, like the French Guards at Fontenoy, request the gentlemen on the other side of the hedge or furrow to fire first. Partridges and pheasants, as well as grouse and blackcock, would have somehow the instinct to discern the difference between the farmer who was only destroying greedy hares and vile rabbits, and the owner with his pointers who was intent on bagging so many brace of birds. It is said that foxes are gifted with an acute perception of this kind, and know perfectly well that the appearance of a keeper and a line of beaters, with a retriever or two at their heels, on a frosty day in December, means no harm, while the faint whimper of a hound or the flash of a red coat, during open weather, gives the signal for instant flight. It may be that, in due time, partridges and other feathered game will acquire a similar acuteness of perception, will distinguish between the old muzzle-loader and the new hammerless gun, and will sit still in the ferns or the rushes because they know that it is only old Farmer Giles going after his ground game. But, to speak seriously, it will be recollected that rabbits and hares may, as the law now stands, be shot down during every month of the year. There is no close time for them. What is to prevent an occupier or his "authorized agent" from exercising his "concurrent" right from sunrise to sunset, any day or every day between the 1st of January and the 31st of December? It is idle to say that men will not go to such extreme or unreasonable lengths, and that concurrent rights will be used with due discretion and forbearance. At any moment a discontented occupier, or a farmer who had been annoyed by some act or word of the squire's keeper, might make the position of master and servant literally unbearable.

Ground game would at this rate certainly be kept under, but other game would as infallibly disappear with it. It seems to be entirely forgotten, too, that a single farm and a large property fit for the legitimate exercise of sport are not always conterminous or identical in extent. In other words, there may be half a dozen or a dozen and more farms on a single estate let for sporting. The right which the Legislature proposes to confer on the occupier may give the owner or squire not one but a bevy of partners in his shooting. When he goes out for an afternoon's sport on any one of his farms, or on two or three of them in succession, he may find that six guns have been blazing away all round during the forenoon, and that his appearance at the gate of a field is the signal for every covey to take wing. That this sort of thing will happen all sportsmen must admit. Friction may possibly be avoided where there are old tenants, who have a respect for owners under whose grandfathers their occupation began; but sportsmen, like poets, are an irritable race. An Eastern proverb says that two Dervishes may sit on one carpet but that one kingdom cannot contain two kings. We do not believe that the friendship of a life or the affection of twin-brothers would long stand the uncertainty and worry engendered by "concurrent" rights to shoot.

We have hitherto been considering the position of the owner who might bring to the working of a strange piece of legislative ingenuity all the advantages of prestige, position, good temper, and political and social influence. But there are other claims to be thought of. There are the numerous lessees of shooting tracts. It will be allowed, we apprehend, that such leases have a high marketable value, and that lessees, especially in Scotland, add largely to the landlord's rental and cause cash to circulate in the neighbourhood. A landlord has more than one place, or is compelled to reside abroad for health, or becomes indifferent to shooting, and wishes to let his country residence to a suitable tenant; and it will hardly be denied, even by advanced Liberals, that hard-worked men of business who keep up an absent owner's house and grounds, consume local produce, employ local labour, avoid Co-operative Stores, and deal with the tradesmen of some small village or town in the North, are not exactly unmixed evils. Many gentlemen in these circumstances have been most anxious to meet the farmers' views with regard to keeping down ground game, and yet have been willing to pay highly for those exclusive privileges both of shooting and fishing which they deem indispensable. Is it in the least likely that they will be as willing to pay at the same rate when they find that their shooting-grounds may be harried by more than a dozen farmers, who are only availing themselves of their "concurrent and inalienable" rights? Scotch proprietors especially, whether Liberals or Conservatives, may well be asked to scrutinize narrowly a measure which may have the effect of seriously lowering their rental, and driving off their shooting tenants to Norway or Canada. We can hardly cast a glance at any of the advertisements of our sporting journals without seeing how valuable an increment to property must be the right to mixed shootings, comprising all kinds of game. But blue hares are found on the tops of hills in Rosshire, and rabbits on moorland tracts; and "concurrent" rights to shoot may take farmers with their guns halfway up the Grampians over the best grouse ground in the kingdom.

And now we come to the position of the farmers, for whose especial benefit this novel principle in legislation is to be applied. Other writers have dwelt forcibly on the vicious principles of the Bill. That it infringes on freedom of contract; that it is at once coercive and protective at the sole expense of the landlord; that it exalts the tenant, who, while farms are being thrown up in every county, is perfectly able to make proper terms for himself; that it must force both owner and occupier into antagonism, distrust, and defiance; and that it cannot fail to convert a remediable grievance into a perpetual standing sore—these are blots which have been hit in leaders and in letters during the past fortnight. But the extraordinary part of the proposal is that the farmer is not to be permitted to part with his new privilege to the person of all others the most fitted to take it back. The Bill starts with the apparent presumption that the landlord and his shooting tenant must be the farmer's "inalienable" foes. The farmer may delegate his right to any one but the owner. The "agent" whom he employs may be the veriest tramp or poacher who ever vexed the righteous soul of the keeper, or grieved the parson by selecting Sunday for his predatory excursions. Other results will be more curious still. A landlord, worried with endless bickering and the outcries of gamekeepers, or not caring for sport, may come to the determination that he had better lease to the farmer the whole remaining rights of shooting; and the latter may be willing to pay for the additional privilege of killing feathered game. Here freedom of contract is allowed. But the converse would be impossible. The farmer, from similar indifference to sport, might be anxious to give back to his squire his "concurrent" privilege; but the law has declared it to be "inalienable." It must abide on him like a garment of Nessus, or the Old Man of the Sea of whom he cannot get rid. Again, there are tracts held by ecclesiastical and civic corporations, the trustees or managers of which are in the habit of letting their farm with the shooting rights, either separately or together. The farmer has often taken from such trustees the lease of land and shootings, with the avowed purpose of sub-letting the latter to some eligible tenant. If this Bill passes, the concurrent and inalienable right by which he is to kill ground game himself would deprive his shooting lease of one-half of its attractions as a marketable article. We know a case in which a splendid sheep farm in the south of Scotland was let by the trustees of the owner, who was incapacitated from managing his own affairs, to a practical man from Bewcastle Dale, with its mixed shooting of blackcock, grouse, rabbits, and hares. The worthy farmer had never fired a shot in his life, and was only too glad to recoup himself, as he was expected to do, by letting the entire and undivided right of sporting over 4,300 acres to a sportsman with whom, to the last day of his life, he continued to be on the very best of terms. Had this proposed law been in existence, the arrangement would have been legally impossible, and the farmer would have been saddled with an encumbrance and a dead loss. He would have lost his shooting rental, and must have employed or hired men to kill down the game.

Cannot the Government devise some better means of remedying a palpable grievance than by passing a law which, if it be not flagrantly evaded, is calculated to set all parties by the ears? We might also lay stress on the fact that the principle adopted will lower the position and dignity of the landlord, will increase any existing bitterness between him and his farmers, and will lead to further attacks on property and its appendages. Possibly there may be some advanced thinkers to whom these results would give exquisite gratification. But our main object here is to show the practical results of the measure if swallowed by Parliament in its present harsh, rigid, and unbending shape. If past experience gives any warrant for prediction, these results can only be the annoyance of the landlord, a sudden fall in shooting-rents, the dismay and flight of lessees, the vexation of the farmer who is anxious to remain on good terms with his neighbours, endless artifices to defeat the law, and a general sense of harassment, distrust, and perplexity. It would be far better to give the injured farmer a cheap and substantial remedy against over-preservation by allowing him to claim damages before a couple of arbitrators, or, in default of this, by a suit in the County Court, or in Scotland before the Sheriff. It seems, further, in the highest degree unfair to include all owners and lessees under one sweeping and prohibitive enactment, merely because some persons have been guilty of neglect or mismanagement, and others have converted a sporting tenancy into a profitable commercial speculation, and have covered a large portion of their shooting rental by game reared and fed at the farmer's expense and sold to dealers in Liverpool or London. It might even be an arguable point to retain the word "concurrent," and to strike out "inalienable." The farmer, clothed with his new right, would dispose of it to the persons most likely to secure or serve his own interests. And such persons would naturally be the landlord or his shooting tenant. Fussy and grandmotherly legislation has rarely taken such a shape as that now proposed. That the Bill will pass after the opposition shown to it by Liberals before the second reading, seems highly improbable. Or if, in its present shape, it be sent up by the Commons to the Lords, who are all owners of land, it can scarcely fail of extinction or mutilation. But if by chance it should become law, owing to a large Liberal majority, the shortsighted views of Chambers of Agriculture, and the unwillingness of peers to resist a supposed popular view, it would only be another example of the inability of ultra-Liberals to grapple practically with troublesome questions, and of the electioneering maxim that there is no despot like a Radical in power.

SAVINGS BANKS.

WHEN the time comes for Mr. Gladstone to defend his proposal to raise the limit of deposits in Savings Banks we shall no doubt know what is at present very much in the dark—the precise class of persons whom the change is intended to benefit. To justify such a proposal one of two things must be established. Hitherto it has been supposed that Savings Banks were set up partly to teach thrift to people who were too heedless to learn the lesson unless it were conveyed to them in a specially plain way, and partly to help those who did not want to be taught thrift, but who were too poor to put the lesson into practice unless some machinery were provided for the investment of their small savings. Both these classes are, and are likely to remain, sufficiently numerous. If there were no Savings Banks a large amount of money that is now put by would be spent. In theory the old stocking would be there to receive it; but the old stocking lies too conveniently handy when money is wanted to make it at all a safe receptacle. It is not a very difficult matter to take deposits out of a Savings Bank, but it cannot be done without the interposition of some short interval during which wiser counsels may prevail. When the old stocking had once been emptied in this way, the inducement to refill it would be very much weakened, and after recourse had been had to it a second time, it would altogether disappear. It takes a more thrifty people than Englishmen yet are to be able to refrain from using money when it is wanted and is to be had by crossing the room. Of course this is not true of all the poor. There are many of them, especially among women, who are quite able to save money, and do save it under circumstances which seem to make the process almost impossible. But without Savings Banks there would be no way of turning these savings to account in the way of interest. It seems hard that a class which has to surmount so many difficulties before it can get together a little capital should be unable to make any profit on its capital when it is got together. It may be only another instance of the law that to him that hath shall be given; but it is an instance in which the law seems to work so hardly that every one is glad when a way of escape from it offers itself. To pro-

vide Savings Banks which shall receive and give interest on very small deposits has for a long time been one of the first desires with every one who is anxious to improve the condition of his poor neighbours.

These are the classes for which Savings Banks have hitherto been intended, and one way of justifying the proposed alteration in the limits of annual and total deposits would be to show that the change is demanded in the interests of the poor. But it seems hardly possible that this plea can be set up. A man or woman who is able to put by 30*l.* in one year, and to leave the yearly ments in the Savings Bank until they amount to 150*l.*, cer- does not fall within the first of the two classes just The habit of thrift has been acquired; the lesson how to forego present comfort for future advantage has been learned. Nor can the change be needed by those who want to gain on very small sums a profit corresponding in kind to that which richer investors gain on larger sums. The sempstress or the charwoman does not put by 30*l.* in the year, and long before her savings have reached 150*l.* she is probably ready to buy a small business or stock a small shop. Consequently, if it is the poor for whom Mr. Gladstone proposes to legislate, it must be a description of different poor from either of these; and where this third type is to be found it would be very hard to say. It may be, again, that the Bill is designed to meet another kind of want altogether. There are those, no doubt, who are not poor in the ordinary sense of the term, and who are yet very much at a loss what to do with the money they annually lay by. The sum may come to a good deal more than 30*l.* in the course of the year, but they have no stockbroker, and though they keep a current account at a banker's, they have hardly so much as heard of a deposit account. There is little doubt that it would be a convenience to many persons in these circumstances to be able to allow their savings to mount up in the Post Office until they were large enough to make a broker willing to accept them as customers. The provisions of the new Savings Banks Bill exactly meet this class of cases. Depositors will be allowed to place 100*l.* in the bank during any one year, and they may go on increasing their deposits until they reach the sum of 250*l.* But the question is not closed when this has been admitted. There are many things which this or that class of persons would like the State to do, and which the State might do with great benefit to the particular class concerned. It has hitherto been supposed, however, that something more than the convenience of a particular class has to be considered before the intervention of the State in businesses which are already more than sufficiently filled can be held justifiable. The State takes the money of the poor, if not at a loss, at all events at a quite inadequate profit, because an ordinary banker will not take it. Is there any reason to suppose that an ordinary banker would refuse a deposit account which grew by 100*l.* each year? Very possibly there are large numbers of persons saving this amount annually who do not like to trouble a banker to take charge of it. But is there any reason to suppose that this diffidence on their part is well founded? If we look at the petition from the Association of English County Bankers presented last week, or to a letter from certain Manchester bankers which has been widely circulated, we shall see very good grounds for taking the contrary view. The only motive which bankers can have for opposing these clauses of the Savings Bank Bill is that they are likely, if passed, to draw away custom which they wish to attract to themselves. Thus, on the only hypothesis on which the Bill can be defended, the custom of people saving 100*l.* a year is custom which only a State office will care to accept. Unless the banking interest is very much of a dog in the manger, this is not in the least true. The Manchester bankers plead that they are "the representatives of institutions voluntarily established by provident persons for the management of their own affairs"; and that it is very unfair towards them that they should be subjected to "the illegitimate competition of banks established for eleemosynary purposes, which are seeking to engraft upon their proper functions those of ordinary bankers who are unaided by the influence and guarantee of the Government." There is nothing here that looks like indifference to such trifling sums as 100*l.* If these bankers do not want to be troubled with deposits not exceeding in all 250*l.*, why should they speak of the competition of Savings Banks as "illegitimate," and envy the Savings Banks "the influence and guarantee of the Government"? The only interpretation that can rationally be placed on these objections is that they imply a desire on the part of those who raise them to obtain those customers whom, as the framers of the Savings Banks Bill assume, no banker will so much as look at.

The petition of the Association of County Bankers is still more explicit upon this point. The petitioners declare that the increase of the maximum limit of deposits in Savings Banks "is an unnecessary interference with the business carried on by the banking community of this country." So far are they from despising the small things signified by the proposed figures of 100*l.* and 250*l.*, that they declare their belief that "fully one-third of the total amount held by country bankers upon deposit and current account consists of sums not exceeding 300*l.*" For this reason they submit to the House of Commons that the effect of the proposed increase in Savings Banks deposits "would be to put these institutions in direct competition with country banks in their own sphere of business." To all appearance, therefore, the case in favour of this part of the Savings Banks Bill is bad on the face of it. It might be doubted whether the Government ought thus to enlarge its banking operations even if it did not thereby come into competition with private traders. But here is a case in which the private traders only ask to be allowed to do the business which the Government propose to undertake. And, as if to make the argument more perfect, the Bill actually provides another and unobjectionable means of meeting the assumed wants of the particular class of depositors which is presumably to be benefited by the extension of the limits of deposits. If the clauses relating to the purchase of Government stock become law, any depositor may request to have his deposit, or any part of it, invested in Consols. The class of persons who have money to invest and yet are ignorant of the ways of bankers will be just as well served by greater facilities for the purchase of Government stock as by greater facilities for investment in Savings Banks. If it is thought expedient to increase their opportunities of saving money, it is towards the purchase of stock rather than towards deposits in Savings Banks that Mr. Gladstone ought to turn his attention. By this means he will escape the imputation of interfering with private trade, while he will equally recommend thrift to a class which has hitherto been supposed to stand in no special need of encouragement in this direction.

MODERN POPULAR SONGS.

THE eternally quoted person who wished to make the songs rather than the laws of peoples could not have had his desire gratified in any but very modern times and very civilized races. In England before the Reformation, and in many European countries now, as in Greece and Italy and Brittany, the people make their own songs and set them to their own music. The Volkslieder of Europe all resemble each other in character. They all date from a time when life was a kind of opera. The peasant had his cradle songs, his wedding songs, his dirges, his chants for seed-time and harvest, and for all the sacred seasons of the year. Other ballads he had in which certain romantic adventures furnished the topic, and a scanty assortment of these topics seems to have served for all the European nations. Girls who were determined to marry "their true loves," false and cruel lovers, a few ghost stories, and some faint memories of romantic episodes in history made up the peasant store of ballad legend. As to the love songs, every one was at liberty to compose these for himself, and every one used the same pretty commonplaces about singing-birds, budding flowers, and sapphires, and gold like the ladies' eyes and hair. The great popular amusement in Greek country districts is still dancing, as it was in merry England

> When Tom came home from labour,
> And Cis from milking rose.

The dances swang and swayed to the music of the ballad singer; they were swift or slow as the song was merry or pathetic. All the world was indeed a stage, an operatic stage, and almost all the education of the peasant was made up of popular songs.

The Reformation, or rather the Puritan reaction, stamped out the spontaneous songs and dances of the English people. These diversions were denounced by the grave Stubbs in his *Anatomy of Abuses*, and were proscribed by every Presbytery. Only among the children, and chiefly in Scotland, have the ancient tunes and the pantomimic verses survived. But the love of song and music naturally remains among the English people, though the faculty of producing original music and song has been crushed. The barrel-organ man in a village or a back street is to modern England what the "blind crowders" with their chants were to the England of Sir Philip Sidney. Little children dancing in a dingy court to the mechanical music of "Nancy Lee" make a pretty sight enough, and are all that we have to show in place of the old choirs of village lads and lasses. A state of things exists in which, as the people cannot make its own songs, some one must make songs for the people. There seem to be two sets of popular bards, whose sale and whose success among the unknown public might make Mr. Tennyson envious. First, there are the music-hall bards. These songsters stir the great heart of the city folks, as it were with the sound of a trumpet. "To arms, to arms, to arms, they cry," in the name of Jingo. They breathe of heady delights, of war, of wine, of the popular Aphrodite. When they do not proclaim their readiness to fight, they admit that they are "Rollicking Rams," that they have "Lost their Latchkey," or that their generic name is "Champagne Charley." They take long sitting shots at the follies of the day and of the town, at the Mona Lisas of photography, at the cheap dandy who chants "Ain't I a Cheese!" The ethical analysis of these popular songs produces distressing results. The residuum of each composition is a deposit of solid unalloyed vulgarity. The lover of rowdy popular songs confesses himself to be a mean admirer of mean things, of a cheap, noisy, flashy sort of life, of a constant state of alcoholic excitement. Fancy paints him in a magenta necktie, with dirty yellow gloves, with a book on the Derby, with a stick that inexpensively imitates the last fashion but two. If popular songs make popular characters, we may expect a ghastly generation of dingy *gommeux* as a consequence of fast music-hall ditties. But there is another class of popular song, which is full of tender sentiment and domestic affection, and bluff, honest pleasure in a laborious life. This sort, if one may judge by the milder kind of drawing-room ditty, and by the airs of the barrel-organ-grinders, is as popular among the respectable

middle classes as "Champagne Charley" among the *jeunesse exiwée* of London. The barrel-organ-man in *Punch* broke up his machine when he heard that he had come into a fortune, and vowed that he would never play "dat tam 'Nancy Lee' again." But "Nancy Lee" is a very moral, refreshing piece of verse, and contains such "criticism of life," to use Mr. Arnold's phrase, as is convenient for the consumption of worthy seafaring men.

There lies before us a small volume of lyrics called *Dresden China, and other Songs* (Diprose and Bateman), composed by Mr. F. E. Weatherly, the author of "Nancy Lee." Though Mr. Weatherly's name is possibly all but unknown to Mr. Maudle and his æsthetically gloomy school, Mr. Weatherly is perhaps the most popular poet of the day. His strains are sung everywhere, as Tasso's used to be in Italy, and, as we write, a small boy passes whistling through his teeth the air of "Turnham Toll." It is possible (as Maudle knows) to have a kind of fame without popularity, and it is possible to have an extensive popularity without very much fame. Mr. Weatherly has still to wait for the latter, and, when it comes, perhaps he will have to share it with Mr. Molloy, Mr. Pinsuti, and other gentlemen who wed to music his immortal lines. Thanks to the barrel-organ and the little boys accomplished in the art of whistling, the music of Mr. Weatherly's compositions is better known perhaps than the words. It is to the words that we would direct attention. They comfort the heart of observers who are saddened by the songs of *le moyen homme sensuel*: by the ditties in which 'Arry celebrates the delight of the eyes and the desire of the flesh. They are full of kindliness, of gentle melancholy suggested by the approach of old age, full of honest purpose, of all manner of moral virtues. Not very many of us perhaps know the words of "Nancy Lee," that air which has conquered every barrel-organ in England. After eliminating a good deal of refrain about

Yeo ho! lads! ho! yeo ho! yeo ho!

we come to the gist of the matter, thus expressed:—

The sailor's wife the sailor's star shall be!

How noble, how elevating is this simple criticism of the mariner's existence! There have been poets who averred that the tar "found a wife in every port." Another singer has ventured on the antinomian refrain:—

It doesn't matter what you do,
If your *heart* is only true.

And his *heart* was true to Poll in verse, though it must be confessed that his conduct was less satisfactory. Mr. Weatherly is really not a poet alone, but an ethical instructor. His jolly tars are not what Mrs. Ramsbotham calls "gay Lutherans." They do not box the amorous compass all round, nor veer with every gale of passion, as Dibdin's tars were too apt to do. When among the ladies of Cadiz, or the liberal beauties of the Society Islands, they hum to themselves

But true an' bright from morn till night
My home will be,
An' all so neat an' snug an' sweet
For Jack at sea,
An' Nancy's face to bless the place,
An' welcome me!

In a vein rather more free and gay, but still dallying with the innocence of love, we have the widely admired "Turnham Toll":—

"Now where are you going so early this morning?
Now where are you going so early?" said he;
He peep'd at her little face under the awning; (orning?)
"I'm going to market, to market," said she!

And here, again, at the close, we have a truly sincere and far-sighted criticism of life. The turnpike-man—no misanthrope, in spite of the elder Mr. Weller—roams half-way to Arcady with the young lady who was going to market. Consequently, the toll is left open on market-day, and the people who look after the roads are out of pocket. But for the turnpike-man and the maiden, as for Mr. William Morris, "love is enough."

But two happy souls, each the other condoles,
That life's something better than markets and tolls.

And so life is, though how the turnpike-man's employers may "condole" him when they hear of his adventure, a sense of poetic justice will not permit us to inquire. If any poem could alter the effect of the orders about fugitive slaves which were imposed on mariners by the late Ministry, it would be "Jack's Yarn." Here a runaway slave boards a British man-of-war.

Then our cap'n he up-stood, so noble, proud, an' good,
An' the poor old nig was at his knee;
"Every man is free," he cries, "where the British colour flies,
An' I'll never give him up!" says he.

Perhaps in the idyl called "A Little Mountain Lad" too much stress is laid on the littleness of the youth. We are informed no fewer than four times in three stanzas that he *was* only a little mountain lad. Happily a lady who had "wooers at her feet, and all that's rich and rare," consented to "be his little bride." Here, again, a popular note is struck. By an innocent piece of socialism, a lady of rank and wealth is represented as resigning her splendour to marry an indigent youth who was under the middle height. The duty of conjugal fidelity is again impressed on the seaman in "Polly," the name of the wife and of the barque of the singer.

Polly an' Polly, they're so jolly,
the sweetest pair in the world.

The sentiment of regret for time passed occurs very frequently in this collection of songs. Here is a pretty example:—

We are drifting down the stream,
by the darkening willow shore,
in a happy golden dream,
and my lover rows no more.
He lets the old boat glide; he is sitting at my side
and saying that his heart is mine
for ever, evermore.

Row! row! under the stars;
flow, stream, by thy sandy bars!
row! row! from shore to shore,
love will last for evermore.

But 'tis long and long ago,
and he is here no more;
I do but sit and dream and dream
beside the quiet shore.
The old boat still floats on, as in the years a-gone,
and thy words are in my heart, my love,
for ever, evermore.

The beauty of a delicate old age, drifting to the still water of death, is the theme of "Granny." In "Old Timbertoes" there is a spirited memory of

the time we licked the Rooshans, boys,
a score o' years ago.

In fact, through this collection of some seventy popular songs, there are scarcely any but touch some honest manly sentiment. We think Mr. Weatherly is now and then too didactic, and once or twice, if we may say so, rather twaddling. But it is a very considerable achievement to have composed so many lyrics that have "go" and feeling in them, that appeal straight to the hearts of honest people who understand not Maudle and his *rondeaux*. There is a vast public for the verse which is less poetical than moral and innocently sentimental, and these verses must go some way to counteract the baneful effects of the rowdy popular Muse.

A PROPOSED SUBSTITUTE FOR THE POOR-LAW.

LORD CARNARVON lately made a proposal in the Upper House which, as Lord Kimberley remarked, "has a very taking appearance at first," and consequently has many advocates among philanthropists who have not given themselves the trouble to think out all the details of the project. Lord Carnarvon's scheme was limited to the agricultural classes, because he believes that it could be more easily worked amongst those classes. But obviously it ought to be universal, if adopted at all. The proposal is to substitute insurance for the Poor-law. Assuming, however, that it were to be tried, the intended limitation to a particular section of the community would raise questions as to the classes which were to be compulsorily taxed and those which were to be exempted, which would cause more odium than any Government would dare to face. If the plan is to be discussed seriously, it must be on the assumption that it is to apply to the whole community. Partly moved perhaps by this consideration, but chiefly from a conviction of its utter impracticability, the House of Lords refused to discuss the project seriously. It may possibly be said that the House of Lords, from its very constitution, could not be expected to lead the way in so sweeping a social change as the proposal implies; that the function of a Second Chamber is to put the drag upon the innovating tendencies of the more popular branch of the Legislature, and that therefore the Peers would have been departing from their true *rôle* had they zealously taken up this question. A very little consideration, however, will show that they had far better reasons for the caution they displayed than any supposed disinclination to engage in a task of social reform. No body of men in England have a more thorough acquaintance with the working of the Poor-laws than the House of Lords, and for that reason they are more likely to feel keenly the objections that apply to them. But a sense of the faultiness of the existing system must not blind us to the unpractical character of the proposed substitute. The object of those from whom Lord Carnarvon evidently borrowed the idea is to eradicate pauperism by compelling every person to insure himself against sickness, accident, and old age, in an office founded and managed by the State. It is admitted that the insurance must be universal, or it would not supersede the Poor-laws; that it must be compulsory, or it would not be resorted to by those certain to require relief; and that the premium paid ought to be sufficient to cover the working expenses and the payments assured, or it would be only charity under another name. Let us suppose that a Bill based upon these principles was presented to the House of Commons, and then let us inquire whether it ought to command the support of men who are fully aware of the objections to the Poor-laws—their communistic taint, their discouragement of thrift, their hereditary transmission of pauperism, and the burden they impose upon the respectable and industrious for the benefit of the worthless and the lazy.

If the State is to enforce universal insurance, it clearly must be able to lay its hand at the right moment upon every person subject to its jurisdiction. It must know the name, sex, age, status, residence, and occupation of every one of its subjects; of such as are employed, it must know by whom they are employed; and it must be informed within a reasonable time of every change of address and employment. In short, it must obtain with
to the whole community as full information as it

[illegible] profligate and ticket-of-leave men. Those who are acquainted with the imperfections of the existing registration of births and deaths will be able to form some idea of the difficulty of obtaining and keeping up such information as this. If it is found impossible universally to enforce registration and vaccination, though in both cases medical assistance can be invoked in aid of the law, what chance is there of tracing every individual in the United Kingdom for at least twenty-one years? And, as the difficulty would be immense, the cost would be corresponding. It may be replied that the cost of the Poor-law is enormous, and would be saved by the suggested change. Granting this, and admitting further that, as nations which have adopted the conscription have found it possible to keep a register of all males, it would not be quite impossible in the United Kingdom to keep a register of the whole population, we still must remark upon the departure from all the habits of English life and English administration which the change would imply. Assuming, however, that the end to be attained is decided to be worth the sacrifice, and that the innovation is actually introduced, we have only got over the preliminary obstacles to find ourselves brought face to face with the real difficulties of the problem.

It is estimated by Lord Carnarvon that in the case of the agricultural labourers a payment of 10*l.* made before the age of twenty-one would be sufficient to entitle each man to adequate relief in sickness and old age. The sufficiency of the premium is an actuarial question, which does not affect the principle at issue. We are willing to assume, therefore, for the sake of argument that the estimate has been carefully and accurately made. In the large towns, where sickness is more common than in the rural districts, the premium, of course, would require to be higher; but we need not enter upon that point now. It is further argued by Lord Carnarvon that an agricultural labourer between the ages of 18 and 21 earns as much as between 30 and 40; that at the former age he is usually unmarried, and therefore could well afford a payment of 10*l.*, which, if spread over four years, would not quite amount to a shilling a week. This may be true enough if we are talking only of men. But it is not equally true of girls, many of whom, indeed, earn nothing for themselves. What is to be done in the case of unmarried girls not earning any wages at all, or earning only occasionally? Are their fathers to be compelled to pay the premium for them out of wages admittedly insufficient for the proper maintenance of a family? Or, if not, is the payment to fall subsequently upon their husbands, should they marry, and thus to discourage marriage and encourage concubinage? Or is public charity to step in? These questions become still more embarrassing in the towns, where the female labour market is yet more overcrowded, women's wages consequently very low, and women's health exceedingly weak. Is a needlewoman, barely able to keep body and soul together, to be called upon to insure against sickness and old age? Or is a shopgirl trying to pay rent and to feed and clothe herself out of shillings a week, to be compelled to pay one of those shillings for four long years to an insurance fund? If the answer is in the negative, the impracticability of the scheme is acknowledged. If in the affirmative, the further question arises, how is compulsion to be applied? The reply is ready, Let the employers pay for their workpeople. But it is not so certain that employers would consent to collect gratuitously the debts of the State at the risk of collision with their men. It is hardly probable that respectable workmen, not having the fear of the workhouse before their eyes, will, for the sake of extinguishing pauperism, which they know by experience to be the result of vice, crime, or laziness, consent to forego part of the market value of their labour; and, if they do not so consent, to render the employer responsible for them would be a very serious matter. The employer of a thousand workpeople, for example, would be bound to pay 50*l.* a week, or 2,600*l.* a year. It is nonsense to say that he would be compensated by the abolition of Poor-rates.

So far we have been arguing on the assumption that all the poor earn something, however inadequate, and that the problem would be how to reserve its due share of their earnings for the State. But notoriously this is not the case. Pauperism is to a large extent inherited, the pauper child seldom emerging from the state in which he was brought up, and always tending to fall back into it. Where it is not hereditary, it is the fruit of vice, crime, drunkenness, and slothfulness. What, then, is to be done with the criminal classes, and those from whom they are recruited—the youth of both sexes, in short, who later in life fill the gaols and workhouses, crowd the casual wards, and are seen at night haunting the streets? A sanguine optimism may hope that education will gradually impart a new character to the population. But legislation is not to be founded on a sanguine optimism; and in any event the realization of the hope is too distant to affect present legislation. Now, at any rate, we have a multitude of criminals, vagrants, prostitutes, and paupers, young as well as old, who have not, and never will have, the means of honestly paying a premium. Thus, when closely examined, this fine-sounding scheme, with all its pretentions, throws the support of the improvident and the ne'er-do-well on the well-to-do and the industrious, just as does the Poor-law. Nor could it be otherwise. Legislation is as powerless to make men thrifty and provident as to make them virtuous; and without thrift and foresight there cannot be independence. It is conceivable that a time may come when, as some philosophers are bold enough to recommend, marriage will be permitted only between people morally, intellectually, and physically healthy, and when all children born will have force of character enough to their own living. Meanwhile we must accept pauperism as inevitable. Nor is it only in the ways we have been pointing out that the scheme is visionary. At present the disgrace attaching to pauperism restrains the respectable poor from applying for relief without urgent and overwhelming necessity. But there would be no hesitation in accepting the allowance which the State stipulated to grant in return for payments made. The Sick Clubs find the disposition to come upon them unnecessarily a standing difficulty, although the members have all an interest in preventing malingering. But nobody would have an interest in protecting a State fund. It would suffice to meet all demands, whatever might happen; and if it did not, the tax-payers would be bound to make up the deficit. So far, therefore, from being an encouragement to thrift, the tendency of the scheme would rather be to promote the shamming of sickness, and thus to discourage honest industry. There would likewise be the danger of fraudulent collusion between the local administrators of the fund and the beneficiaries. There is the further objection from the financial point of view that, were the Government to engage in such a business, it would inevitably draw to itself the business of the insurance Companies, and would be in a position absolutely to control the money market. But it is needless to multiply arguments against a scheme which it is difficult to imagine any statesman seriously entertaining.

SCULPTURE IN 1880.

It is highly satisfactory to those who have long regarded the condition of sculpture in England with a sort of hopelessness, to be obliged to recognize this year a distinct increase of vitality in the art and a corresponding revival of popular interest in it. The Royal Academy has done nothing to facilitate the study of those works which it still contemptuously relegates to the background of a central resting-room for weary visitors, and the unusual attention that the sculpture receives must be put down to its unusual excellence. It is not that any one or two statues of startling proportions have attracted popular gossip, but that the average level of merit is decidedly higher than it has been for a long time. Once more we venture to repeat the suggestion that the Royal Academy, gracefully coming forward to recognize the revival of sculpture among us, should do something to remedy the pressure of space and ignominy of position which do so much to ruin the effect of the best groups and statues. It would be easy with the exercise of a little ingenuity to distribute the principal figures through the rooms so as to give the sculptors a few more of those advantages which the painters enjoy in abundance; nor would it injure the effect of the pictures to confront them here and there with the cool and serene beauty of marble.

We were not so fortunate as to like Mr. Hamo Thornycroft's principal work last year, and we have therefore special satisfaction in joining the chorus of praise that has greeted his "Artemis" (1566) as the best figure of the present Exhibition. The artist has chosen one of those moments of arrested movement which lend themselves so happily to heroic sculpture. The goddess, passing swiftly through the forest, suddenly perceives some hind or stag in front of her, and pauses, while with her right hand bent over her shoulder she takes an arrow out of her quiver. Her left hand is pressed back by her hound, which has strayed on to her right side, an incident that is both original in itself and useful in compressing the composition. The head is modelled with singular dignity and distinction, and the artist has, whether intentionally or accidentally we know not, given to the features of Artemis something of the type conventionally associated with her brother Phœbus. The drapery is worked out with great freshness and skill, the sharp folds of light tissue clothing the limbs with fresh delicacy rather than concealing their proportions. Where all is so delicately conceived and learnedly executed, it would be ungracious to dwell on the somewhat over-pensive expression of the head, to which the excitement of the chase might, even in a goddess, have lent some livelier show of animation. The modelling of the left shoulder is worthy of special praise. The figure is not well placed, and if it be exhibited again, in marble or bronze, we hope to find it so situated that it can be examined from all sides.

The new Associate, Mr. Charles Birch, is an artist who has won his position by sound and careful work; but this year he has hardly done justice to his powers. His principal group, Lieut. Walter Pollock Hamilton defending the Embassy at Cabul, is a subject scarcely suited for sculpture. The brave and devoted young soldier stands astride a prostrate Afghan, and holds out a pistol in his right hand. His pose is not without vigour; but the form of the dying Oriental projects too much from the composition, and destroys its outline. The "Moment of Peril" (1575), by Mr. Thomas Brock, is better in every respect, and would indeed be worthy of great praise if it were thoroughly original. A naked Indian warrior has allowed his horse to trample on the coils of a boa constrictor; and the enraged serpent, having already paralysed the hind-quarters of the horse, menaces the rider too with his erected fangs. There is a wild air of horror and suspense about the face of the Indian that gives great value to this spirited composition, which should without delay be executed in bronze. Mr. Boehm overwhelms the Lecture Room with a colossal equestrian of Lord Napier of Magdala (1585), which is to be cast in

bronze and set up in some public square in Calcutta. Until it reaches its destination, criticism must be silent about it, for at present it is impossible to see it, except from the further wall of Room VIII., whence, unfortunately, the foreshortening of the horse's head gives the animal almost a ridiculous air. So huge a work it is scarcely wise to exhibit within the walls of a gallery. One or two groups deserve mention, if hardly praise. Mr. Atkinson's "Æneas Protecting the Body of Pandarus" (1563), and Mr. T. S. Lee's "Death of Abel" (1532), are composed with cleverness, especially the latter, but each is spoiled by the clumsiness of the female figure. The recumbent body of Abel in Mr. Lee's work is carefully studied and gracefully modelled. Mr. Hamilton M'Carthy's "Robert Burns and Highland Mary" is weak and sentimental, and the monstrous disproportion of the heads must strike the least experienced observer.

Mr. Birch and Mr. Hamo Thornycroft each exhibit a carefully finished bronze statuette of a nude male figure. It is interesting to compare the two most prominent among our younger sculptors in this exact juxtaposition. Mr. Birch's "Retaliation" (1557) shows a mountaineer, at whose feet a lamb lies dead, defending himself from an unseen eagle. It is a reduction of a statue exhibited last year. Mr. Thornycroft's "Putting the Stone" (1612) tells its subject in its title. Both works are interesting and accomplished, but the second is the more remarkable from a technical point of view. The thin and sinewy legs and prominent ancle-bones of the youth who puts the stone are modelled so realistically and with so little regard for effect, that the general public is likely to prefer Mr. Birch's more rounded figure with its graceful reminiscence of the antique; but artists and physiologists will recognize the treatment of the trunk in Mr. Thornycroft's figure as of rare science and exactitude. The two statues are worthy to be bracketed as excellent examples of the best work in sculpture now being produced in England. Mr. George Lawson's "Daphnis" (1556) is a good figure, surmounted by an uninteresting head. Mr. Lawes's "Daphne" (1562) has merits, but recalls one of the triumphs of Mr. Watts. Mr. Horace Montford has propounded an enigma in his "Iphigenia" (1564)—a female figure leaning gaily forward, and crowning herself with a chaplet—which we cannot and scarcely care to solve. Mr. George Simmonds has produced one of the worst figures of the year in his life-sized statue of Sir William Muir (1570), the drapery and general treatment of which recall those dark ages when Noble filled our streets with monumental sculpture. Mr. Calder Marshall is only represented this year by a single figure, a graceful "Miranda" (1584). Mr. Boehm's model of a marble statue of Lord John Russell (1592), to be placed in the Central Hall of the Houses of Parliament, strikes us as singularly spirited and dignified. Mr. Mullins exhibits a sprightly statuette of Mr. Val Prinsep (1632), in Volunteer uniform.

Mr. Armstead has rarely exhibited anything more original or charming than his decorative panel "The Courage of David," in which he shows himself a rare master of the fanciful and dainty art of bas-relief. The distribution of broad planes of surface in this work is delightful to the eye, and gives the composition a thoroughly sculpturesque, as opposed to a picturesque, effect. The young David, wrestling with a lion, tears his jaws asunder by the mere force of his hands; it is to be wished that the attitude of these hands were a little more natural and vigorous. But of the originality and beauty of the work there can be no question; it forms to the student of sculpture one of the most hopeful features of the Exhibition. It is destined to decorate the Guards' Chapel in St. James's Park. It is interesting to pass from this eminently monumental bas-relief to Mr. Tinworth's clever "Going to Calvary" (1517), a bas-relief composed in a spirit directly opposite, in discipleship of the pictorial sculptors of the Renaissance—Ghiberti or Donatello. The science of the gradation of masses, which is the keystone of the practice of bas-relief, is not known to Mr. Tinworth as it is to Mr. Armstead, but the former has produced a work of extraordinary verve. In the figure of the Saviour it might have been admissible to add grandeur by an actual increase of physical size, as the romantic Italian bas-relievists would not have scrupled to do; but the robust and brutal forms of the soldiers, the hurrying groups of Apostles, the outlines of the Thieves and of the bystanders, are all excellently conceived, and the entire frieze, though rather an animated fragment than a composition, deserves careful study. Signor Raggi shows, by his "Entombment" (1513), that he has yet to learn that it is one of the fundamental rules of bas-relief, a rule rarely infringed by the great masters of the art, to represent faces in profile; every one of his figures looks out at the spectator, and the result is absolute confusion. Mr. Stephens's "Lecturer" (1519) is sadly weak and ineffective.

In iconic sculpture Mr. Armstead takes the lead this year by his grave and expressive bust of Dr. Selwyn (1534), and his pensive "In Memoriam, B. W. K." (1524). The former is a masterly portrait, the form and character of the skull being designed with the utmost vigour, and the expression of the features with the utmost lightness and freedom. This great branch of the art is at once more widely cultivated and more unwisely disdained than any other by our English school of sculptors, who too often allow a sigh of weariness to escape from their busts when their figures display the full tension of ambitious effort. It is, in fact, in the department of the bust that we see least to congratulate ourselves upon in the Exhibition of this year, and the best specimens, almost without exception, are to be found in the Vestibule, where, besides Mr. Armstead's heads, are placed Mr. Woolner's "Dr. Percival" (1535), and Mr. Thornycroft's "Sir Arthur Cotton" (1537). In the Central Hall Mr. Brock's "General Boileau" (1581), and Mr. Onslow Ford's "F. Hellyer, Esq." (1589), deserve the praise due to intelligence and flexibility of handling. In the Sculpture Gallery, properly so called, Mr. W. W. Taylor's powerful and affected head called "Caius Cassius" (1596) shows promise; Miss G. E. Bulley exhibits a well-conceived but badly-executed bust which she names "St. Elizabeth of Hungary" (1623); and Mr. Boehm demands respectful notice, but scarcely enthusiasm, for his portrait of Mr. Ruskin (1635). A creditable medallion by Mr. Bruce Joy (1527) exhausts the catalogue of noticeable works at the Royal Academy.

At the Grosvenor Gallery sculpture is very weak this year, and perhaps for this reason Miss Henrietta Montalba's heads seem to demand an attention which her work at the Royal Academy can scarcely be held to claim. This clever artist has, however, as a matter of fact, sent all her best work to New Bond Street. Her portrait of the Marquess of Lorne takes rank among the best busts of the year, and her romantic heads entitled "Tito" and "Romola" are full of fire and vigour. Mr. Nelson MacLean, whose beautiful "Ione" made a distinct mark last year, sends a little figure of singular delicacy and sweetness, to which he has appended some lines which denote his intention to design a wood-nymph pouring from her slender urn the stream that is to become one of the great rivers of the world. Several busts by Mr. Belt show an infirmity of purpose and lack of technical skill which are curiously combined with a specious smoothness of surface, and can hardly be too strongly reprehended. Signor Amendola, in three clever statuettes of ladies, shows that he possesses considerable pictorial talent, but that he has as yet formed no conception of the true function of the sculptor. Such work as this is dangerous alike to artists and to the public, for both are greatly liable to be attracted by its facile and fatal prettiness.

PARIS AND ASCOT.

A MAN who is even moderately fond of racing may do worse than go over for a few days to Paris and see the Grand Prix. It is not unpleasant to leave London for a short time in the middle of the season, and Paris at this time of year is not overcrowded with British tourists. We know no other meeting at which racing is seen in such comfort as at Paris. On the stand, or in the lawn on the course at Longchamps, we are not surrounded by Sir Wilfrid Lawson's "bawling blackguards," and if there are in attendance a considerable number of what that worthy baronet describes as *roués*, they are comparatively noiseless. There is little jostling and crowding round the horses when they are being saddled, and one can have a good look at them when they are being led about before their jockeys mount them, without getting knocked and pushed about, and having one's pocket picked. The journey from Paris to the course and back, unlike that from London to Epsom, is one of the pleasantest parts of the day's proceedings. Then there is always, to our mind, something grotesque in the affectation by Frenchmen of English horseyness, and the energetic endeavours of the Parisian bookmaker to make his bets are rather ludicrous than offensive. At Paris, again, we may, if we choose, see all the racing without hearing or seeing the betting men at all. On the way to the course, the appearance of a fiacre containing four fat English bookmakers with white hats and blue veils makes an amusing contrast with the general surroundings. The stands, the course, the officials, and the very race-cards are all different from what we are accustomed to at home; and, best of all, the racing is often very good indeed. Unfortunately for those who wish to be back in England for Tuesday's racing at Ascot, the trains and boats are sometimes unpleasantly crowded; and racing on five days, with sea-sickness on another, is rather hard work for one week.

As usual, we were represented this year in the Grand Prix by a "Champion Anglais." This was Robert the Devil, who had only been beaten by a head for our own Derby. Special interest was taken in this horse, because there were great diversities of opinion among racing connoisseurs about the value of his performance in that race, as well as about the manner in which his jockey had ridden him. A large number of critics maintained that his rider had made too sure of winning the race, and that he had not kept him going at his best pace long enough. Others as stoutly denied that the horse could have won as long as Bend Or was in the race, in whatever manner he might have been ridden. Bend Or, they said, had been shut in at Tattenham Corner, or he would have won with the greatest ease; while, as it was, he speedily overhauled Robert the Devil from the moment that he got clear of the ruck of the field. As to the method of riding which was adopted with Robert the Devil, it was said that the only hope of enabling him to win was to make the running with him, for it was rumoured that "the Devil" was a cur, and that, in racing parlance, "he shut up when collared." As both Bend Or and Robert the Devil are entered for the St. Leger, it was a matter of great interest to English racing men to arrive at some conclusion upon this question of the currishness or otherwise of the second in the Derby, and it was hoped that a good race in the Grand Prix might set the matter at rest. The Frenchmen entertained great hopes of making Robert the Devil put his best leg foremost with a horse called Beauminet—a bay colt by Flageolet out of Be[illegible] It was true that he had already received a beating in the

Thousand Guineas, for which he only ran fourth, being behind Muncaster, whom Robert the Devil beat easily in the Derby; but French racehorses are proverbial for in-and-out running, and some of Beauminet's performances appeared good enough to give him a chance of testing the powers of Robert the Devil. He had won between six and seven thousand pounds in stakes this spring in France, in three races—a Biennial, the Great Produce Stakes, and the French Derby. Le Destrier was also by Flageolet. He had been an uncertain runner, but he had won three races this spring, including the Poule d'Essai, a stake worth more than two thousand guineas. Arbitre was the third favourite. His running had been of a variable nature; but he had beaten Voilette, who had beaten Le Destrier in the Prix Daru.

The day of the Grand Prix was cold and showery, and the gay dresses of the ladies were either discarded for more wear-and-tear garments, or covered up with waterproofs and warm shawls; but the weather did not prevent a large number of people from attending the races. There was a curious assemblage of men and women of various grades and politics; the Duke d'Aumale, M. Gambetta, the Prince de Joinville, M. Jules Grévy, M. Koechlin, the hero of the Rochefort duel, as well as a host of other "varieties." The Grand Prix is supposed to be the concluding event of the Paris season, and large numbers of people who care nothing for racing consider it the proper thing to put in an appearance before leaving the capital for their châteaux or watering-places. Fortunately, the rain cleared off a little just before the great race. At the first attempt at a start the ten competitors got away on very fair terms. Boum, Arbitre, and M. Lefèvre's beautiful mare Versigny (whom we described last week) made the running, followed by Robert the Devil, Le Destrier, and Beauminet. The pace was very good, and the course, in consequence of the recent rains, was a trifle heavy. After they had gone on for about a mile the three leading horses began to tire, and Poulet and Milan, who had been respectively third and fourth for the French Derby, attempted to get to the front. Poulet made a great effort as they came into the straight; but he was soon beaten. Robert the Devil had evidently more left in him than any of the others. Although the Frenchmen had relied on Beauminet making a hard fight with the English horse, when it came to the actual struggle both Le Destrier and Milan ran better. The race was completely in the hands of Robert the Devil, and he won in a canter by a length; Le Destrier was second, and Milan was only three-quarters of a length behind him, Beauminet being a length behind Milan. Although the winning of the Grand Prix is but an indifferent recompense for the loss of the Derby, in a monetary point of view there was but little difference between the value of the two races, the Derby being worth 6,375*l.* and the Grand Prix 6,076*l.*

There was great tribulation last week among the ladies who intended to attend Ascot races. The arrangement of the Ascot toilette is one of the most important events in the feminine year, and the month before the races is the busiest of the whole season for the dressmakers. The beautiful dresses had been designed, ordered, and in many cases even sent home, when the death of the Empress of Russia, within a week of the races, spread consternation among the ladies. It was known that an order for a Court mourning would but too surely follow the sad event, and therefore all ladies who were privileged to enter the Royal enclosure would be obliged to deny themselves the pleasure of wearing the coloured dresses which had been specially made for the occasion. It might be supposed that by far the larger number of the ladies who attend Ascot races are not invited to the Royal enclosure, and that consequently they would be at full liberty to wear any colours they pleased. This undoubtedly is true; but as the fact of appearing in coloured costumes would have betokened that the wearers were not possessed of tickets for the Royal enclosure, most ladies preferred to sacrifice their finery rather than to be suspected of being excluded from the hallowed precincts.

A very wet morning was not an auspicious beginning of the first day of the Ascot meeting; but, although there was a drenching shower as the horses came out for the first race, the weather cleared up as they started, and the remainder of the day was fine. It is not our intention to notice in this article the general racing at Ascot; but we propose to make a few remarks about the Prince of Wales's Stakes, which completes the set of great three-year-old races of the spring and early summer. Neither the winner of the Derby, the Oaks, nor the Grand Prix was in the race; but the winner of the Two Thousand was to compete against the fifth in the Derby, the third in the Two Thousand, and nine other horses. The field was scarcely of such a high class as we usually see in this race. Some of the starters were weedy and small, and one had the flattest back we ever saw in a racehorse. Numerically speaking, the field had not been stronger for ten years, and the race itself appeared to be a very open one. Petronel, the winner of the Two Thousand, is a strong useful horse, but he does not show so much breeding as some of the other three-year-olds of the year. The Abbot, who had run third to him for the Two Thousand, second to Mask for the Payne Stakes, and second to Isonomy for the Manchester Cup, certainly shows breeding; but he is a weak-looking beast, although he has proved himself strong enough to be a good stayer. Zealot, who had been fifth in the Derby, had run very badly in the Two Thousand; therefore, on public running, he should have had no chance of beating Petronel. He is a well-shaped horse, but in the paddock at Epsom he hardly showed to advantage by the side of horses like Bend Or and Robert the Devil. Without entering into the details of the early part of the race for the Prince of Wales's Stakes, it will be sufficient to say that the field kept pretty well together until the turn into the straight was approached, when only the three horses which we have described were left in the race. Zealot then took the lead, and Petronel made an effort to catch him; but the 5 lbs. extra weight which the last-named horse had to carry told upon him, and Zealot soon shook him off. A far more valiant attempt was made by Abbot. This horse rushed up, on passing the iron stand, with great speed; but he could not catch Zealot, who won the race by a length. Both Zealot and Abbot are by Hermit, the former having been bred by his owner, Lord Bradford. Zealot's dam was by Stockwell. It is satisfactory that the winners of the Derby, the Oaks, the Grand Prix de Paris, and the Prince of Wales's Stakes at Ascot, are all entered for the St. Leger. Next week we hope to notice the rest of the racing at Ascot.

Of late, yearling sales have been scarcely as successful as they were a few years ago, but the first great sale of this season was encouraging to breeders. At Marden Deer Park, twenty-six yearlings averaged two hundred and ninety-six guineas a-piece, a price which is generally considered remunerative, if not absolutely a high one. A couple of Blair Athols realized a thousand guineas each, and a colt by See Saw brought in eleven hundred guineas. A son of Springfield was sold for seven hundred and twenty guineas, and a filly by the successful Flageolet went for four hundred. The Marden Deer Park is, comparatively speaking, a young stud, and breeders rarely realize high averages during the early years of their stud farms.

REVIEWS.

THE DUKE OF WELLINGTON'S DESPATCHES.*

THE new volume of the Wellington Despatches begins with November 1831 and ends with December 1832. The Reform Bill, brought in after the assembling of the new Parliament in June 1831, was read a third time and passed in the Commons on September 21, and was thrown out in the Lords by a majority of forty-one on October 8. The country was thrown into a state of extreme and alarming agitation. Political Unions began to procure arms, and there were frightful riots at Derby, Nottingham, and Bristol. The Duke of Wellington made a direct personal appeal to the King, insisting on the great risk involved in the licence allowed to the Political Unions, and it is with his action in this matter that the new volume opens. A new Reform Bill was introduced in the Commons on December 12, its introduction having been preceded by negotiations between Lord Grey on the one hand, and Lords Harrowby and Wharncliffe on the other, with the object of devising modifications in the Bill which might satisfy the less violent of its opponents in the Lords. These negotiations failed, and the Bill remained as it had been, with the exception of the adoption of the Chandos clause and the restoration of the House to its full numbers. The third reading was carried by a majority of 116 on March 23, 1832. Sufficient pressure had been put on the Lords to secure the second reading by a majority of 9, but the peers adopted an amendment, proposed by Lord Lyndhurst, that enfranchisement should be taken before disfranchisement. On this Lord Grey and his colleagues resigned; Lord Lyndhurst was sent for, and he and the Duke attempted to form a Ministry. They failed. Lord Grey was again sent for, and on May 17 the King gave Lord Grey and Lord Brougham a written permission to create the number of peers necessary to carry the measure. On the same day the King, through Sir Herbert Taylor, sent an entreaty to the Duke and those acting with him to absent themselves from all further debates on the Bill, so that the creation of peers might be avoided. The Duke assented to this; the third reading had only twenty-two opponents, and the Bill received the Royal assent on June 7; and the passing of the Scotch and Irish Reform Bills quickly followed. Parliament was prorogued on August 16, and dissolved on December 3; and the elections gave an overwhelming majority to the authors of the Bill. It is with these elections that the present volume of despatches closes, so that it may be said to cover the period from the riots which followed the rejection of the second Reform Bill to the elections which followed the passing of the third. It is almost exclusively occupied with the subject of Reform, and is more monotonous, and therefore less interesting, than its predecessors. It is chiefly filled with statements of the Duke's views on Reform, with expressions of gloomy foreboding, and with explanations of the attitude which at various times he assumed towards those who acted with him. From first to last he never wavered in his opinion that England would be ruined if the Bill passed, and was ruined when it did pass. As, in point of fact, England was not in any way ruined by the passing of the Bill, but was started in a new career of prosperity and greatness, the Duke's opinions have not at the present time much speculative value. What is really interesting and instructive is to trace the practical conduct of such a man holding such opinions in such a time. If, as a civilian, he cannot be called a great man, he was

* *Despatches, Correspondence, and Memoranda of Field-Marshal Arthur, Duke of Wellington, K.G.* Vol. VIII. November 1831 to December 1832. London: Murray. 1880.

at least a much greater man than most of those who followed him and looked to him for guidance.

The Duke wrote to the King on the 5th of November, 1831, as to the evils to be apprehended from the Political Unions arming themselves as a sort of National Guard. The King wrote on the 7th a reply which the Duke considered curious, and in which he thought he could trace the handiwork of two different persons. But at any rate the reply conveyed, in explicit language, the King's general agreement with the Duke, and his anxiety that some step should be taken to put down the Unions in this new character of armed revolutionary bodies. On the 22nd a proclamation was issued by the Ministry against the Unions, and the Duke entirely approved of this proclamation. But he found that, on the very day when the proclamation was issued, the Birmingham Union had decided to adopt a mild and gentle tone, and this the Duke considered to be a vile Whiggish trick. The Government, he hoped, would have had to break with the Radicals when the proclamation was issued. On the contrary, it appeared that the Government was on such friendly terms with the Radicals that the Radicals were willing to keep quiet when to keep quiet was to help their allies in office. "We must confess," the Duke wrote to Peel on the 26th, "that these Whigs are about as honest and trustworthy as the newly discovered society of *Burkers* in London." Meanwhile the negotiations between Lord Grey and Lords Wharncliffe and Harrowby were going on. The Tory negotiators communicated their hopes and intentions to the Duke. He answered that he could have nothing personally to do with any negotiations. He thought all Reform wrong, and he was most strongly of opinion that, if force was boldly used, the Reform agitation would be speedily suppressed. At the same time, he fully acknowledged that the rejection by the Lords of the Bill in the preceding month was not the work of a party, but an expression of the personal opinions of those who voted against the Bill. Lord Wharncliffe and Lord Harrowby were therefore not deserting their party in trying to get an improved Reform Bill carried, and the Duke merely left th[illegible] alone, neither opposing them nor supporting them, except so far as not to support them was to oppose them, since, if the Duke would not bind himself to accept what the Ministry would concede, the Ministry might naturally think that it was scarcely worth while to offer anything. He wrote to one correspondent after another that the Whigs, who had duped him with their pretended proclamation, would dupe the negotiating peers in their turn; and before the end of November the Duke's prophecies were so far fulfilled that the negotiations came to an end. He neither knew nor cared to know how this happened. He had too lofty a scorn for Whig bargains to stop to inquire why any one attempt at bargaining with Whigs had come to nothing. But it was only in name that the negotiations came to nothing, for the spirit that prompted Lord Harrowby and Lord Wharncliffe to negotiate in November prompted them in the following April to vote for the second reading of the Bill in the Lords, with the hope of amending it in Committee. The Duke was extremely angry with them. These men, he wrote on April 7, 1832, "are responsible for more than they are aware of. Their defection from the good cause may occasion its ruin. If they had not left us we should have had a majority of not less than sixty, with all the gentlemen of England at our back, against the Bill. We might have dictated our own alterations." He was soon to have an opportunity of trying his hand at dictating alterations.

After the second reading was carried in the Lords the Duke was convinced that a Reform Bill must pass. He felt sure that there would be a creation of peers if any amendments were insisted on at variance with the principle of the Bill, and he owned that it would seem much less objectionable that peers should be created to carry out the principles of a Bill accepted by the Lords than it would have seemed that peers should be created to force a Bill on the Lords the principle of which they had rejected. He and his friends, therefore, set themselves to work to see what amendments they could devise which Lord Grey would admit. But he protested that, whatever amendments were obtained, he personally should vote against the third reading; and he continued to rage with indignation against those whom he and his friends termed the waverers, who were anxious to know from Lord Grey what amendments would be accepted. After long consideration, the Duke and Lord Lyndhurst determined to begin by proposing an amendment which would bring back a sufficient amount of waverers to their standard, and yet be fatal to the Bill. It was proposed to begin with enfranchisement. This was entirely at variance with the principles of the Bill, for the Reform party insisted that the rotten boroughs were bad things in themselves, and ought to be abolished, whereas, if it was first decided how many new seats should be created, it would then appear how many rotten boroughs were to be sacrificed. It was entirely impossible that the Ministry should accept this amendment. On the other hand, many of those who had broken away from the Duke on the second reading were not prepared to break away from him on a mere amendment as to the order of taking clauses. The Duke and Lord Lyndhurst carried their amendment, and then there happened something which seems the most natural thing in the world, but which the Duke appears to have never contemplated. They had beaten the Ministry, and the King decided that they should have their chance of replacing those whom they had defeated. Lord Grey would not continue in office unless he was allowed to make peers to carry his Bill. Before agreeing to the creation of peers, the King very properly thought that those who had defeated Lord Grey ought to show him whether they could or could not carry on the Government. Lord Lyndhurst and the Duke set to work at once to form a Cabinet. No passage in the Duke's political life is more curious than the history of the few days in which this hopeless experiment was being tried, and if the new volume of despatches had contained any documents throwing real light on what occurred, the contribution to political history would have been in the highest degree interesting. Unfortunately we learn little from it, for the obvious reason that negotiations of the kind that went on are rarely committed to paper. From the outset Peel refused to join the new Government. The project of the Duke and Lord Lyndhurst was to bring in a Reform Bill of their own, and Peel declined being a party to a measure when it came from his side which he had opposed when it came from the other. Those who were occupied in forming a Cabinet thought it possible to do without Peel. But no one of any real political influence would have anything to do with so impracticable a scheme. Two days after the Duke undertook to form a Ministry, he wrote to the King that he had secured Sir George Murray and Sir Henry Hardinge. He never got beyond Sir George Murray and Sir Henry Hardinge. If Mr. Baring could be got, then it was thought all might be well. But Mr. Baring could not be got unless the Speaker, Mr. Manners-Sutton, were got, and the Speaker strongly declared he would rather be Speaker than a Minister. At last Lord Lyndhurst was reduced so low in his views that he wrote on May 14 to the Duke, and proposed that they should "assemble some dozen of the best of our young friends in the House of Commons and ask them if they will undertake the fight." Nothing at this distance of time could seem more grotesque than a scheme for mastering a House of Commons in which there was a Liberal majority of more than a hundred, and for overawing and tranquillizing an agitated nation, by the random help of twelve young Tories. The Duke resigned his hopeless undertaking on the 15th; but the King, who found that his new Prime Minister could never get beyond Sir George Murray and Sir Henry Hardinge, had already approached Lord Grey on the subject of his resuming office. To no one could the device of asking peers to absent themselves in order to avoid a creation be more welcome than to the Duke. It offered him a most acceptable mode of getting out of a situation from which he would otherwise have been powerless to extricate himself. He could retire with some dignity from further meddling with Reform when he retired in obedience to the wishes of his Sovereign.

For the Sovereign to whom he yielded the Duke had a feeling of contemptuous pity. The King had only consented to the creation of peers with much reluctance. On the 16th of May, Lord Munster wrote to the Duke that Lord Grey had come to see the King, and that five minutes before Lord Grey came the King had repeated to the writer that nothing should make him create peers. Within twenty-four hours the King had given Lord Grey a written permission to make peers. The Duke had never deceived himself on this head, and had felt sure the King would give way, whatever he might say to Lord Munster or any one else. The Duke had worked himself up into very strong convictions about the Reform Bill. He had reasoned out in his own mind the whole question of Reform, and had assured himself that exactly the same issues were being fought out as had been fought out when Charles I. quarrelled with his Parliament. But then, as he mournfully confessed to more than one correspondent, the historical parallel was not quite so complete as could be wished. For on this occasion the new Charles I. was on the wrong side. This was most puzzling and exasperating to the Duke. He had looked the possibility of a new civil war in the face, and did not by any means shrink from it. His cause was a cause worth fighting for, and he was ready to fight. Not that he apprehended any serious contest, for he was sure he could put down all opposition with very little trouble. But he was quite prepared to use force if he could get the opportunity. To his mind the real question to be decided was whether there was to be any Government at all. The only Government possible in his eyes was the Government of the gentry—not of the House of Lords, for he considered peers as a mere part of the gentry. The Reform Bill would take the Government out of the hands of the gentry, and therefore there would be no Government. Theoretically the House of Commons controlled the Executive, and this, if carried out in practice, would have meant anarchy. But practically the Executive, if it had the gentry with it, controlled the House of Commons. But this control was not exercised in a blind and dictatorial manner. The great merit of the House of Commons in its unreformed state was that it represented all classes. Merchants represented large towns, colonists bought rotten boroughs, mob-orators were returned by pot-wallopers. Then every set of people outside the gentry had their spokesman to whom the gentry and the Government listened patiently, with an honest desire to pick up any crumbs of wisdom that might fall from their mouths. At the head of the Executive was the Sovereign, who imparted his views to the Executive, which in its turn imparted theirs to the gentry. This was the Duke's theory of the English Constitution, and he not only most sincerely believed in it, but altogether declined to admit that any other was tenable. Hence he was supremely indifferent to all discussions about Schedule A and Schedule B, to arguments from the claims of large unrepresented towns, to attacks on noblemen and gentlemen who owned pocket-boroughs. His correspondents

keep plying him the the first half of this volume with their schemes for arranging this point, yielding on that, and manoeuvring on a third. The Duke persistently replied that if this sort of thing amused them he did not wish to spoil their sport, but that he only saw one object great enough to occupy the mind of a true statesman, the preservation of the Government of the gentry. But he had always one overwhelming difficulty present to his mind, whether he was thinking things over with himself or writing or talking to others. The King could not be got to see that the Duke was advising him the right course to keep his throne. He looked across the water, and, when urged to walk in the paths of Charles X., satisfied himself that it would be more prudent to lean in the direction of Louis Philippe.

The Duke was too much absorbed during the period embraced in this volume by the varying fortunes of the Reform Bill to write frequently or at length on other matters. Still there are some discussions of miscellaneous subjects which are not without interest. There is, for example, an exposition of his views on corporal punishment in the army, which may fairly be termed exhaustive. The British army must, he begins by saying, be recruited by volunteers. For a conscription can only be enforced for the defence of a country, whereas the British army does not for the most part serve at home, but is sent all over the world. The service is, however, in itself unattractive, for even if a soldier by good conduct can avoid punishment, he cannot avoid "service for life at moderate pay in unwholesome climates." Those, therefore, who enlist cannot be very creditable specimens of their race. "It cannot be denied that in ninety-nine instances out of one hundred some idle, or irregular, or even vicious motive is the cause of enlistment of the volunteer." Men so got together can only be constrained to serve the State according to their engagement by the exercise of the strictest discipline. To enforce discipline small frequent punishments are necessary. But the soldier would never submit to those small punishments unless he knew that if he did not submit there was a punishment of which he was terribly afraid in reserve for him. The only punishment he really fears is flogging; therefore, to the mind of the Duke, flogging was the key-stone of the British army, and the Duke must, on such a subject at any rate, be allowed to have been as good a judge as ever lived. Of course, if the whole character of the army could but have been altered, and the service made attractive to respectable men, who freely chose a career to their taste and submitted with cheerful intelligence to the necessary discipline, he would no longer have thought flogging necessary. But, while the Duke was ready to give his views on military subjects, he showed throughout his life that there never was a great soldier who had so little of military arrogance. In his mind arms always yielded to the toga. The sword was always subordinate to the law. In those times of agitation one or two cowardly attacks were made on him, and many more were threatened. To those who gave him warning he uniformly replied that he always trusted to the law to protect him. "If you have got any evidence that you can lay before a magistrate, lay it; if you have not, do not trouble me with unsubstantiated gossip." This was in substance his uniform reply; and now that all he then wrote is fifty years old, and times are changed, and the great man is in his grave, it is difficult to read without emotion these calm and dignified utterances of a brave and noble-minded man. The Duke trying in a bewildered way to get up a Ministry which no one but Sir George Murray and Sir Henry Hardinge would join presents a rather sorry picture to our contemplation; but the Duke abiding by the law, trusting to the law, despising threats, and going about London as calmly as if he had been a popular idol, presents a picture which may well move the imagination and stir the pulses of one generation of Englishmen after another.

LEX SALICA.—THE TEN TEXTS.*

THE thoroughness with which the old Frankish or Salic law has been examined in this sumptuous volume will be manifest to all who may take the trouble to compare the materials here brought together with those which were accessible to Gibbon, and even to his editor Dean Milman. The purpose of the historian was, indeed, mainly to contrast the codes of barbarian law with what he regards as the contemporaneous consummation of the system of Roman jurisprudence by Justinian; and if he gathers from the contrast that the Romans had the advantage not only in science and reason, but also in humanity and justice, he yet allows that the laws of the Barbarians were adapted to their wants, their occupations, and their capacity. But of the Salic Law he thinks that Latin was the original language, and he assigns the time of its composition to the beginning of the fifth century, before the time of the real or fabulous Pharamond. For the contents of this law the most complete edition to which Dean Milman could refer was that of Laspeyres, who published a synoptic edition of five texts at Halle in 1833; but of this work Mr. Hessels remarks that "his texts cannot be relied upon, apart from the fact that it contains only the Wolfenbüttel and the Munich codices by the side of the text published by Schilter, Herold, the Lex Emendata, and the Lex

own object has been simply to furnish the best materials which can be got together for the student of this important document. He has therefore carefully resisted all temptations to draw up what might be called a critical edition. He has reproduced the codices without the slightest alteration except in the punctuation, which he leaves the reader to alter at his will, inasmuch as the only mark used in the texts is what we usually call the full stop, and in the MSS. is found commonly in just those parts of the sentence where we should not put it. The sixty-five chapters for which we have the ten texts are given without a break; the remainder are introduced with separate notices of the documents in which they are found, and with references to other works in which they have been published, the reader being warned that the uncertainty as to the time when and the legislators by whom these later chapters were drawn up makes it unsafe to arrange them in any definite order. The codices of the Salic Law, here reproduced, may be divided into five classes or families. To the first family belong four MSS. of the eighth and ninth centuries, two of them being preserved in Paris and the other two at Wolfenbüttel and Munich. Mr. Hessels remarks that these four codices are generally regarded as containing the shortest and oldest reduction of the Salic Law in sixty-five chapters, which correspond to the first sixty-eight chapters of the Lex Emendata. These sixty-five chapters are distinctly referred to in the Recapitulation of the Salic Law; and it is further noteworthy that they contain no enactments against the murdering of priests, the burning or pillaging of churches, or the marriage of near relations; in other words, that they clearly belong to a time when Christianity had not become general among the Franks. The second family of texts consists of two MSS., both in Paris, and both exhibiting additions and interpolations which belong to a later period, as in the matter of fines to be enforced on those who marry within forbidden degrees of kinship. In the third family we have three MSS. belonging to Montpellier, Paris, and St. Gallen, which show the so-called Malberg glosses, with four others (three preserved in Paris, the fourth at St. Gallen), which are without these glosses, the text of these MSS. resembling that of the second family and the Lex Emendata, but divided into ninety-nine (in the St. Gallen MS. into a hundred) chapters. In the fourth family we have the emended Salic Law, given in not less than seventeen MSS., of which the greater number are preserved in Paris. The text of this family of codices is usually called Lex Reformata, the revision being ascribed seemingly to Charles the Great, although the MS. No. 4626 of the Paris Library states at the end of the Prologue:—"Anno ab incarnatione D. N. I. C. DCCLXVIII. indictione VI, dominus rex noster Carolus hunc libellum tractati legis Salice scribere jussit." The date is variously given in the MSS., and Mr. Hessels remarks that Charles the Great appears not only not to have prohibited the use of the earlier redactions, but that the work done in 768 or 798 consisted probably in eliminating the Malberg glosses from the text, correcting the Latin, omitting a certain number of paragraphs found in previous redactions, and admitting a few others. The only text assigned to the fifth family is the text published by Herold at Basel in 1557. Of this text the editor states that it differs from all others at present known:—

> No trace of the Fulda MS. which Herold used has hitherto been found. That he had more than one MS. at his disposal is clear from the various readings he gives in the margin, which differ not only from Herold's text itself, but also from all the other texts. There is, therefore, reason to suppose that at least two of the MSS. he used have been lost, unless we assume with Grimm that the marginal notes may also have been in Herold's MS.

Herold's text, Mr. Hessels adds, has the appearance of being an amalgamation of several versions.

But, except for the few whose studies lead them especially in this direction, and who are under no need of stinting the time to be given to it, the careful synoptic exhibition of the codices would be of comparatively little use without the notes of Professor Kern. These notes it would be almost an impertinence to praise; and we will only say that he has placed all who care to go into the subject at all under a heavy debt of gratitude. The Salic Law is indeed a document of singular interest, not only as a Teutonic code of pre-Christian origin, but as being the chief source of such knowledge of the Frankish dialect as may be still accessible. It is useless to look for poems, translations of the Gospels, or other works belonging to the age of the first settlements of the Salian Franks in Gaul. None such exist; and the Teutonic words in modern French, when brought back to their ancient form, seldom enable us to determine their specifically Frankish character. "They may," as Professor Kern justly remarks, "have been borrowed from Burgundian, Gothic, Rhine-Frankish, Alamanic, not to speak of such words as had already passed into Latin before it broke up into distinct dialects." It is fortunate that, for this very reason, the Salic Law must draw to itself more attention, since, if we had other sources of information for the Frankish dialect, few perhaps would be tempted to spend much time on a document "abounding with difficulties of all sorts."

Foremost among these difficulties is the confused and bewildering state of the text. So disfigured are the codices that Grimm was tempted to give up as absolutely hopeless the task of penetrating to the meaning of the words. The scribes employed in reducing the law to writing clearly did not know either the Frankish words dictated to them or their meaning, nor are they less careless or even

* *Lex Salica.—The Ten Texts; with the Glosses and the Lex Emendata.* Synoptically edited by J. H. Hessels, with Notes on the Frankish Words in the Lex Salica, by H. Kern, Professor of Sanskrit in the University of Leiden. London: Murray and Trübner. 1880.

better informed with regard to the Latin portion of their work. Thus, where one of the codices has the words *si citra Ligeri(m) aut Carbonariam*, another makes nonsense of the clause by substituting *sic eligere aut carbonariam*, while a third gives *sic inter alligare aut carbonarius*, and a fourth introduces "a would-be correction," *si citra mare aut carbonaria*. Such corruptions may perhaps be ascribed to the fact that the scribes were writing from dictation; and the forms which they assume are happily useful in enabling the inquirer to determine the relations of the several codices. On this part of the subject he could not have a better guide than Professor Kern, who has also probably set at rest the question relating to the original language of the Salic Law. Like Gibbon, Grimm was disposed to think that it was drawn up in Latin, although he allowed that the relics of the indigenous forensic language embedded in it "by no means look as if they were translations from the Latin, but rather as original." But the existence of this forensic language attests a comparatively well-developed practice of law. It follows, therefore, in Professor Kern's words, that, "all the materials for the compilation of the Latin Salic Law being extant, its originality can be only an originality of the second order; the Latin text may be original in its arrangement, but it is not so in its constituent parts." Nay, even if the Frank compilers wrote down their laws in the first instance in Latin, the Latin text is still only quasi-original, "because those men certainly did not discuss and think in a foreign language." It is, in fact, simply a translation from an original "which was never written down, but nevertheless actually existed in the mind of the author." Professor Kern is, however, not disposed to stop short here. That the first part of the law is earlier than the reign of Clovis can scarcely be doubted; and the story told of the four men specially appointed to draw it up shows at least that from a period considerably anterior to the fifth century the law had in the tradition of the Franks remained "essentially the same, notwithstanding such modifications and additions as became necessary in the course of time." What temptation could they have in those pre-Christian ages to compile a Latin text? After their conversion, and when they had found themselves amongst a Latin-speaking population, a Latin edition might well become as necessary as it was superfluous before. The further question as to whether the genuinely original law was or was not committed to writing Professor Kern rightly treats as one of quite subordinate importance, and indeed as scarcely worth consideration:—

There is [he insists] no essential difference between poems, laws, moral precepts, &c., handed down by oral tradition or in writing. The Vedas are not a whit less authoritative or less rigidly fixed because they were perpetuated by tradition. Far from being dependent upon Vedic manuscripts, the latter on the contrary are of unusual correctness, because the stains could at any time be washed out by the clear waters of the ever-flowing fountain of tradition. No codices can vie in purity with the Vedic texts, nay, not even inscriptions on brass or rocks, exposed as they are to the all-corroding influence of time.

Professor Kern is certainly justified in refusing to draw any distinction between compositions in prose and in poetry in reference to their transmission by oral tradition. The notion that writing is indispensable as a condition for the preservation of prose documents has for many minds the strength of a superstition. In his well-known Prolegomena, Wolf could express his utter inability to imagine that any one could take to prose composition at all, unless he possessed materials by which he might render it permanent without trusting to the treacherous action of the memory. The Rig Veda, it is true, was not known then as it is now; but he might have remembered the vast masses of Eastern romance handed down from age to age solely by the oral recitation of Oriental storytellers without the strong religious sanctions employed to secure the purity of the Vedic text. Having thus protested against an argument which he regards as inconclusive and scarcely pertinent, Professor Kern adds that in his opinion oral transmission, if used at all for the handing down of the Salic law, must very soon have been given up; and he comes to this conclusion as to the Salic text "just because it shows all sorts of blunders not easily committed by a trained oral tradition." He thinks therefore that it was written down a long time before it was translated, and that it was so presented in Runic characters.

A further source of difficulty in dealing with the codices lies in the confusion constantly made by the scribes between two or more letters. They were not, it seems, in the habit of pronouncing the *h*, whether additive or genuine; and in this way *chanzisto*, the Old English *Hengest*, becomes *axisto*. In like manner we have *cher*, *her*, *er*. The explanation, Professor Kern thinks, is to be found in the fact that the Franks probably pronounced the *h* as all other Teutons do to the present day, and that "the *ch* was only a clumsy device to represent that sound already lost in the Romanic tongues of the period." In evidence of this he adduces the name written first Chlovis, afterwards Clovis, adding that this form never really "existed in the mouth of the people, as is proved by the French Louis, which could never have arisen from Clovis, and is only explicable when we suppose that the Franks said Hluwis."

We have said enough to show the judicious care of Professor Kern in dealing with a subject of unusual difficulty. It would be useless to follow him in his scrutiny of Frankish words in the Salic Law, when his treatment of every word is all that could well be desired. The task of commenting on the language of the Salic Law may be regarded as finished; and the reader of these notes will acknowledge that it has been achieved with singular success.

THE WANDERING NATURALISTS.*

WHEN Mr. J. A. Lawson first came before the public as a writer he bore the title of "Captain." In reviewing his *Wanderings in New Guinea* we said that it was "in no spirit of idle curiosity, still less out of any captious or sceptical turn of mind, that we ask why Captain J. A. Lawson omits to tell us in what service, or in what country, even on which element, he attained the rank which his title-page exhibits." We cannot remember that our question ever received any answer. Happily it is no longer needful to press it; for, whatever may have been that service which gave him his distinction, he has, it would appear, retired from it. So little regard does he seem to retain for it that he does not even care to describe himself as "late Captain." One passage in the work before us would lead us to believe that he must be a Scotchman. He is describing the Himalayas, and tells us how he came in view of "Mount Everest, the highest mountain in the world." He was not, he says, so much struck with its appearance as he had expected, perhaps because his imagination had led him to picture to his mind an imposable (*sic*) mountain. He adds:—"However, its great magnitude, height, and grandeur were certainly imposing [not imposable, the reader will notice], not to mention the novelty of viewing a mountain which, after giving due prominence to Arthur's Seat, Edinburgh, is the most remarkable in the world." We are reminded how, when one day Adam Smith was boasting of Glasgow, Johnson turned to him with the question, "Pray, sir, have you ever seen Brentford?" This mountain might possibly, by the way, be turned to some account in the matter which has of late so much agitated the House of Commons and the country. It might be a great saving of public time, and therefore of public money, if Mr. Bradlaugh could be induced to go out, at the cost of his country, to attempt its ascent. Mr. Lawson, when he tried to go up it, was, he tells us, "a very young man, not gifted with much wisdom, and holding the doctrines of an atheist; but I came down from that mountain a firm believer in a Supreme Being, the majesty of whose wisdom was inexplicable and awful; and my conviction was permanent. No greater testimony, I think, can be given of the grandeur of the scene which met our view." Some three years later, as our readers may remember, Captain Lawson—for he was a captain at that time—ascended a mountain in New Guinea, which, if we may trust his measurement, was rather more than 3,000 feet higher than the highest mountain in the world. What convictions were produced upon him on that occasion we have forgotten.

It is not easy to tell how far Mr. Lawson expects his readers to take him seriously. In calling his work "A Story of Adventure" it would seem to be the case that he does not pretend to give any very accurate description of the doings of the Wandering Naturalists. Nor does he always write like a man who has ever been in the countries which he describes. It would be a very easy matter for a writer who had never gone out of sight of Arthur's Seat, with the help of a couple of books at most, to write a much more lifelike account of adventures in North-Eastern India. It is not, for instance, at all needful for a man to have travelled for him to avoid such a gross blunder as that into which Mr. Lawson falls when he makes the sun rise, a little north of the Tropic of Cancer, not long after four o'clock in April and again in November. Scarcely more absurd is the statement that the author and his friend, both strangers to India, with the help of two "blacks" whom they picked up in Rungpur, discovered passes over the Himalayas into Thibet, and back again into Nepaul. The four mules which the travellers took with them on their journey were not unworthy of the "blacks." We had noticed in Captain Lawson's *Wanderings in New Guinea* the amazing means of transport that he had. His brandy-flask seemed like the widow's cruse; however far he travelled (and he travelled a long way), however much he refreshed himself at it (and he refreshed himself very often), there was always brandy left. But his four mules almost surpass his flask. They convey, to begin with, the traveller's baggage, a travelling tent, cooking pots and utensils, blankets, wines, spirits, and medicines, ammunition, provisions, and a variety of other articles which the party were likely to require. Next we find that added to their load was a splendid and expensive set of instruments to assist Mr. Lawson's companion, a Frenchman, in his observations and discoveries. We read on, and we come upon a great copper kettle, then on cases for mounting butterflies, beetles, and botanical specimens, together with the means of preserving skins and stuffing the smaller specimens. The load of spirits must alone have been enormous; for, besides the supply needed for the travellers' consumption, it was in spirits that the reptiles were preserved. The unfortunate Frenchman suffers a compound fracture of one arm, and later on has a severe cut from a sword in the same arm. This perhaps was in one way fortunate, for at all events the mules' load was somewhat lightened by the need the patient was under of drinking plenty of wine. The eager naturalist, however, was no sooner convalescent than he added several hundred specimens to his collection, so that the poor mules must have been as badly off as ever. Before very long the hundreds of specimens had grown into thousands, while we presently find that the travellers had been carrying with them preserved meats and vegetables, together with a store

* *The Wandering Naturalists: a Story of Adventure.* By J. A. Lawson, Author of "Wanderings in New Guinea," "Travels and Sport in Burmah," &c. London: Remington & Co. 1880.

of oatmeal. Sometimes, too, they were for a while without what Mr. Lawson calls "that necessary element," water; so that this had to be carried also by the travellers. It was no wonder that the collection grew most rapidly; for never before surely did travellers find themselves amidst such an abundance of animal life. Tigers seemed to pop up on all sides like rabbits. The author fired at a buck, "dropping it without a struggle. Simultaneously with my shot four large tigers sprang out of the jungle." One of the tigers gave chase to the naturalists. They fired at it, "and the tiger went writhing to the ground, its limbs contorting tremendously." Down came upon them a tigress with the speed of lightning. Mr. Lawson fired too soon, and his ball only broke her off fore-leg. His companion's bullet took more effect, and the tigress lay motionless in the dust. However, she rose again, and in a moment seized the Frenchman and dragged him off in her jaws into the jungle. Mr. Lawson pursued and at last shot her dead. "I conducted," he said, "M. Paulet back to camp at once, for I had apprehensions that the other two cubs might attempt to avenge the death of their mamma." It was in this adventure that the Frenchman's arm was broken. He would have been more seriously hurt had not the bullet which he had fired, before he was seized, broken the animal's jaw and passed out at the back of her head. As, in addition to this, one of her forelegs was broken, it must be allowed that the tigers in that part of India are of great strength and ferocity. The skins of the tigers were, of course, added to the loads of the unhappy mules.

Snakes swarmed in no less abundance. "They, with the proverbial malignity of their kind, hissed at us from all sides." The travellers tried to catch some of the smaller kinds. "Armed with long wooden tweezers, we attempted to compromise the liberty of the wily little reptiles." We wish, by the way, that we could find some hopeful means of attempting to compromise the liberty of those writers who so abuse their mother-tongue. But they are even harder to deal with than snakes. Before long the naturalists had managed to catch as many of these reptiles as they could want; whereas we have always failed, so far as we know, to compromise the liberty of even a single silly author. One day Mr. Lawson sat down upon a cobra. He was bitten in three places, but he managed to cure himself. However, the bite of snakes on his own showing often leaves melancholy results. "There is," he says, "now residing in Surrey a lad who has become a permanent idiot through the bite of one of those creatures." If a viper can do so much, what must we not expect from a cobra? So deadly is it that no one but Mr. Lawson has ever been known to recover from its poison. We must not, therefore, be too hard on his English, his foolishness, or his apparent failures in memory. Let us think of the lad in Surrey, and congratulate our author on not being a sillier writer than he actually is.

From snakes and tigers the naturalists passed on to larger game. They shot a large male elephant. M. Paulet tried to dissect the body, but he was met with an unexpected difficulty. "It proved so unwieldly (*sic*) that even with the assistance of the men we could not turn it once." The weight of an elephant might have been known, we should have thought, by so eminent a naturalist as this French gentleman, "who had been deputed by a Society to study animated nature in Northern India." Perhaps the bite of a tiger affects the mind in some such way as the bite of a cobra or a viper. He may have become not a permanent, but a temporary and a partial, idiot. However, it was most fortunate for the mules that the elephant could not be turned over. Had the men been able to lift the huge beast, it would, we may feel sure, have been added to the other specimens which these unhappy creatures already bore. The roads along which they had at times to travel were bad enough, even if they had not been carrying vast loads. In one place they had to go along "a terrible chasm that yawned so closely at our elbows." They then went over as remarkable a piece of engineer's work as has ever come within our knowledge. They were in a ravine at a height of some thousands of feet above the bottom of the precipice. The path, which had hitherto been cut in the solid rock, suddenly came to an end. "In its place an artificial road was constructed in the following horrible manner. Rough wooden pegs were driven into the face of the rock in a parallel line, and upon them were placed, loosely, planks of pine, covered with heavy granite-like slabs. The pathway was about two feet wide." Before long, the pegs were found to be not of wood, but of iron; the pathway, however, was, if anything, narrower. It is not surprising that over such a pathway one of the animals fell. On their reaching the end of the pass the travellers were not much better off. A large pine-tree fell upon another of their beasts and crushed it, while the rest of them "careered away." Meanwhile, "rain commenced to fall with that exasperating steadiness which prognosticated that it has 'set in' for no inconsiderable space of time." The author before long fell into a pit. When his friend at last came to his rescue, "a warm sensation," he writes, "ran through every vein in my body, and I felt like a man made of cork." A few days later on he has a fight with a desperate gang of murderers, and performs some great feats of daring.

All these stories have really nothing to recommend them but their extravagance. "If my life depended on it," says Mr. Lawson, "I do not think I could write an efficient and interesting description of a building, however lordly." Whether his descriptions ever deserve to be called efficient we do not pretend to know. Certainly they are never interesting. He never throws an air of reality over his story. The reader never for a moment has a lively and clear scene raised before his mind. He is told of wonders certainly, but then he never finds himself wondering. He never makes the slightest approach to the state of mind of the Bishop who did not believe much more than half of *Gulliver's Travels*. None of these adventures strike him for a moment as probable. Mr. Lawson may, no doubt, plead justification. He may say that he entitles his book a "Story of Adventure." But a story should at all events have an air of probability, and that air is never attained by a single one of our author's writings. Even his miraculous conversion fails to convince us. We certainly believe him when he tells us that, when he was a very young man, he was not gifted with much wisdom. We do not fail, moreover, to take into consideration both the fact that he was bitten by a cobra and also the peculiar and distressing effect that is at times left by the bite of snakes. We are therefore ready to treat him with some indulgence, if not indeed with pity; but, at the same time, we cannot honestly recommend his book. It may be the work of a converted atheist, but it is uncommonly dull reading.

INDIAN FAIRY TALES.*

MISS MAIVE STOKES is the youngest of the handmaidens of science. At the early age of thirteen she has collected and translated a number of Indian fairy tales, for the amusement of children and the instruction of comparative mythologists. The difficulty of inducing simple people who know traditional popular tales to tell them to strangers has long been recognized. Sometimes the narrators seem to fear lest they may be divulging a secret of their tribe; more frequently they are afraid of ridicule. They cannot see why bearded men (and mythologists are often bearded like the pard) should care for old wives' fables. But the Ayahs Dunkní and Múniyá, and Karim the Khidmatgar, had naturally no hesitation about imparting their fairy lore to a child. Miss Maive Stokes was thus able to collect her stories, to translate them, and to have her version revised by her Ayahs. The result is that her form of the Hindoo tales is authentic, while her style is just what it should be, the simple happy style of a child diverting other children with stories of wonder. The late Mrs. Stokes added notes which show an unusually wide acquaintance with the literature of *märchen*, and Mr. Ralston has supplied an erudite introduction. Mr. Ralston will forgive us for saying that children who read Miss Stokes's pleasant book should skip both introduction and notes. If they look into these forbidden chambers of the volume, they may lose the power of seeing fairies and of believing in their wonderful adventures. But older people, who have paid their visit to fairyland long ago, may profitably study the scientific speculations with which neither Miss Maive Stokes nor readers of her own age have any concern.

Considering these stories first as fictions intended merely to amuse, we can hardly class them with the narratives collected by Grimm or translated by Sir George Dasent. The homely humour of the North is naturally absent, and the adventures are a little too tremendous. We can endure a good deal in the way of startling incident; but a princess whose eyes become two birds, while her heart turns into a great tank, and her head into the dome on the top of a palace, borders on the incredible. We are accustomed to dead heroes and heroines that revive with ease; but in the Hindoo tales God himself goes about giving every interesting character three lives. Now this is hard on the wicked stepmothers and other villains of the Oriental fancy, who never really have a fair chance of succeeding in their nefarious projects. Fairies are as common in Hindoo as in French *märchen*. The air, the earth, the water swarm with these beings. Except in M. Sébillot's *Contes populaires de la Haute Bretagne* (Charpentier, 1880), we have never found fairies so thick on the ground as in Miss Stokes's collection. Now fairies are comparatively rare in the popular tales of Europe. The supernatural machinery is supplied by intelligent birds, beasts, and fishes. But Miss Stokes's fairies are more graceful creatures, and will give pleasure to all the children who may read her book. They will also be much pleased with a humorous "Cat who could not be killed," and the adventures of "The Bél Princess" will excite their warm sympathy and pity. But they may fail to appreciate the excellent motives of the dog who devoured "the Boy with a moon and star," just to keep the lad out of harm's way.

The incidents and plots of these Hindoo tales are very like those which we find in *märchen* all the world over. Mrs. Stokes in her notes has referred to African and New Zealand, as well as to European, parallels. She did not, however, emancipate herself from the still rather prevalent theory that *märchen* have some connexion with what we may call "solar" mythology. For example, Mrs. Stokes observes that many of the Indian fairy princes have golden hair and a fair skin, and says, "I believe that they all owe their characteristics to the fact that such are the characteristics of the solar hero, although they cannot all lay claim to a solar origin for themselves. For this golden hair and white skin, at first the property of the shining sun hero alone, would naturally in the course of time be given to other Indian folk-lore heroes on whose beauty and brightness it was necessary to lay a stress." But Mrs. Stokes goes on to remark that "the black-haired Maoris give their sea-nymphs yellow hair," while "the Maoris

* *Indian Fairy Tales.* Collected and Translated by Maive Stokes. With Notes by Mary Stokes, and an Introduction by W. R. S. Ralston, M.A. London: Ellis & White. 1880.

do not seem to have any myths of golden-haired solar heroes." Till the position of the "solar hero" is made much more clear, and his existence much more certain, than it is at present, it would be wiser not to use him as an explanation of the fact that dark people prefer golden-haired fairies. Mr. G. S. Lang, in a work on the *Aborigines of Australia*, mentions that some natives used to worship, in their way, the little golden-haired daughter of a European settler. And we may not unreasonably suppose that the Hindoos and New Zealanders have either some recollection of contact with fair-haired peoples, or have invented fair-haired as a foil to their own dark-haired beauties; or, in some cases, have endowed their fairies with gold tresses since they met blond Europeans. It may be added that, in the poetry of primitive peoples, gold is bestowed very freely on all manner of commonplace objects. The "Kalewala" is full of gold birds, gold hills, golden-footed bears; knives, and even tables and ploughs are all of gold in European ballads, from those of France to those of Roumelia, and vestiges of the same taste remain in the *Song of Roland*, and the Iliad and the Odyssey. But all this gold is not the gold of the sun.

Nothing is more common in *märchen*, savage or civilized, than the story of a voracious animal which swallows every one it meets, and then somehow permits its victims to escape. In Miss Stokes's collection a frog eats a rat, a baker, a man who sold oranges, a horse with his groom, and a barber. But the barber's razor cut a hole in the frog, and out popped all the company, the rat, the horse, the orange-seller, and the rest. Mrs. Stokes in a note says that Mr. Tylor classes this form of *märchen* with "day and night stories," and connects with it the legend of the New Zealand sun-hero, Maui. Mrs. Stokes had just said that the New Zealanders "do not seem to have any myths of golden-haired solar heroes"; so Maui must be a solar hero who was not golden-haired. But as Bushmen and Eskimos, no less than the ancient Greeks, have this tale of the voracious animal, it becomes necessary to ask whether these rude peoples have also created a solar mythology. Now the hypothesis of the solar mythologists seems to be this—at a period of Aryan civilization when the family was a perfected institution, when agriculture, metallurgy, and kingly government were familiar facts, and when a decimal system of numerals had been established, language was still in such a condition that grandchildren forgot the meaning of the figurative expressions by which their grandfathers had described the sunset and the sunrise. The grandchildren turned the metaphor into a legend, and told how Night had swallowed her child Day, and so forth. According to Mr. Max Müller (*Chips*, vol. ii. pp. 80, 81), this extraordinary process, in which "the older members of a family spoke a language half intelligible to themselves and strange to their children," went on even after the early Greeks had settled in Elis. The whole theory demands a searching criticism; but are we to believe that the Bechuanas and Eskimos and Bushmen have constructed their own theology by a similar process of forgetfulness of the meaning of words? Does the "philological analysis" of their *märchen* support this view? They certainly have not attained anything like the civilization of the Aryans of that "earliest period," that "mythopœic period," when society was so nearly perfect, yet so strangely oblivious of the meaning of words. The difficulties, in short, of the theory are so great that we may prefer a simpler hypothesis. The existing collections of savage fairy tales made in North America, Africa, and New Zealand prove that the savage imagination is content (at least for fictitious purposes) with the wildest inventions, in which animate and inanimate things act in the most absurd way. The same absurdities are found in the mythologies and *märchen* of civilized races, and it is no great stretch of fancy to suppose that as men advanced they have not relinquished, but only modified, stories which had perhaps seemed credible enough in the stage of savagery. We may illustrate our meaning by a quotation from Mr. Max Müller. He is speaking of certain Greek legends, chiefly of that which puts "Kronos" in the position of Miss Stokes's devouring frog. "Among the lowest tribes of Africa and America we hardly find anything more hideous and revolting," says Mr. Müller. He had just asked, "Was there a period of temporary insanity through which the human mind had to pass, and was it a madness identically the same in the South of India and in the North of Iceland?" We answer, there *was* a period, not of insanity, but of savagery, like that of "the lowest tribes of Africa and America," through which the human mind had to pass; that period was "identically the same" in essentials for all humanity, and the fictions invented in that period of irresponsible forms have left their traces in all mythology. The existence of the savage imagination, with its irresponsible love of hideous absurdities, is an historical fact. Maoris, Murris, Bushmen, Kanekas, are at the present moment inventing nonsense precisely like their own *märchen*. But where do we find a civilized people like the Aryans, first forgetful of the meaning of words, then constructing abominable legends of incest and murder out of the material provided by their own forgetfulness, and, lastly, weaving these legends into the history of their gods? There is no historical example, to our knowledge, of this process, which is merely deduced by philology from facts that may be otherwise explained. The presence of patches of solar mythology in the notes of almost all collections of fairy tales must be our excuse for this long digression. It is necessary to keep constantly reminding readers of such collections that the philological theory of mythology is by no means a house built upon a rock.

Mr. Ralston, the author of the introduction to Miss Stokes's collection, does not put his trust in any tottering hypothesis. His short essay is perfectly scientific in method. He carefully separates what seem to be the Oriental accidents from that portion of the Hindoo stories which appears to be common at least to all European popular literature. He observes with truth that "we do not possess a sufficiency of accurate designations for the numerous species of the genus folk-tale." We need an accurate terminology, if we are ever to elucidate the meaning of these stories, and discover the secrets of their origin and distribution. Mr. Ralston has persuaded himself that the "mythological ideas and moral teaching" of Asiatics have "shaped and trimmed," if they have not created, many stories now current among European peoples. This is a very fair presumption. Our own *Cinderella* was "shaped and trimmed" by Perrault before it reached our nurseries. But the illiterate French version of *Cinderella*, *Cendreusette*, is quite unlike our Cinderella, and very like our illiterate and traditional forms of *Cinderella*, named *Rashin-Coatie* and the *Sharp Grey Sheep*. And when Mr. Ralston speaks of the influence of Asiatic mythology and moral ideas on *märchen*, we must always ask ourselves, did the people, the peasant class in whose mouths *märchen* have their life, know any more of Buddhist or Vedic ideas than the country girl who tells you *Cendreusette* knows of Perrault's *Cendrillon*? Much depends on whether a tale reached Europe from the East through literary channels or by illiterate tradition. Mr. Ralston attempts to show that the common *märchen* in which one of the persons wears a "husk," or skin of a beast, which he can throw off at will, is connected with Indian mythology. But we do not see how Indian mythology could influence the Red Indians of North America, among whom this belief exists in a peculiarly interesting shape. On the other hand, it appears to us that, when the human mind had become incredulous about the transformations which seem so natural to savage fancy, the machinery of the "husk" would be naturally and almost inevitably introduced as an explanation. But the whole topic demands a more precise consideration than our time or our materials permit us to give. We would suggest to Mr. Ralston that the story of the girl who loses her lord, as Psyche lost Cupid, as a punishment for having ventured to look at him, may find an explanation in early marriage customs. The incident occurs in *Le Pilote de Boulogne*, a Breton *märchen* published by M. Sébillot. The son of the pilot marries a mysterious princess from "the land of Naz," whose face he has never seen; "c'est l'usage du pays; les maris ne voient leurs femmes sans voile que lorsqu'elles sont devenues mères." But the Breton ventures to look at his wife by night, and, like Psyche, lets a drop of melted wax from his candle fall on her face, with terrible consequences. Now the Fijians, the Circassians, the Turcomans, and many other races have, or had, customs like this which forbade the husband to see his wife (Lubbock, *Origin of Civilization*, pp. 75, 76). And it is possible that the incident of the punishment of bridegroom or bride was invented to sanction the strange prudish custom, the custom which forbids a Yoruba woman "even to see her husband, if it can be avoided." A similar custom forbids the bride in some countries to pronounce her husband's name. That prohibition is also common in fairy tales. Much remains to be done for the elucidation of *märchen* by the study of the primitive imagination and of early popular customs. But we so far differ from Mr. Ralston as to distrust all methods which explain *märchen* by considerations drawn from the official mythology or philosophic moral teaching of any people. In Asia the morality, indeed, has probably deeply affected the people, but *märchen* contribute more to the explanation of the higher, the learned Vedic myths, than the learned myths can lend to the elucidation of *märchen*.

To mythologists of every shade of opinion, and to children of every age, we heartily recommend Miss Stokes's book. The stories are well told, the book is well edited, well introduced, well indexed, well annotated, and well printed.

SCIENCE FOR BEGINNERS.*

It is to be hoped that the young folks of the present day will be found duly to appreciate and diligently to profit by the aids to scientific learning now placed in such abundance and such variety at their command. When writers of the first rank in special departments of science give their time and toil to the task of making sure and easy the first steps in the study of nature, the more mature generation of workers may well feel an interest in seeing that advantages far beyond those enjoyed by themselves at the outset of their career bring forth due fruit in the precision of knowledge and the soundness of method which should mark the scientific students of the age to come. Many a self-taught man of science will be disposed to look back with a sigh to weeks or months spent in painfully spelling out for himself elementary truths of nature which nowadays every child may grasp intelligently after as many hours conning of his Science Primer. Nor is it so much in regard to the mere facts of the physical world as to the method and spirit in which

* *Science Primers.—Introductory.* By Professor Huxley, F.R.S. London: Macmillan & Co. 1880.

Practical Chemistry; the Principles of Qualitative Analysis. By William A. Tilden, D. Sc. Lond., F.C.S., Professor of Chemistry in Mason's College, Birmingham. London: Longmans & Co. 1880.

Easy Lessons in Light. By Mrs. W. Awdry. Illustrated. London: Macmillan & Co. 1880.

the secrets of nature are to be approached that the guidance and training of a master are of untold value to one taking the first steps in the path of study. What to observe and how to observe; how to assign to each fact, in itself more or less isolated and empirical, its fitting place and value in the general scheme of knowledge—such are the problems which the beginner has the most vital interest in solving, and on the proper solution of which may turn the whole future of his intellectual career. Loose habits of observation, neglect of the logical processes whereby alone the truths observed and stored up are assimilated into the mental organism and issue in fresh and healthy growths of knowledge, are faults which once contracted are with the greatest difficulty eradicated. And here is due the highest meed of gratitude to the professor who is not above handling the grammar and accidence of his science. Not a few of our acknowledged leaders in special departments have not thought it beneath them to take the tiro by the hand, and steady his first tottering steps in the pursuit of exact and systematic truth.

We have now before us a batch of little books undertaken with this kindly purpose, and suited, we believe, to realize the design of laying a sound and solid groundwork for the fabric of education. Foremost amongst these we must rank Professor Huxley's short treatise, long promised as an introduction to the series of Science Primers published under his editorship, jointly with Professors Roscoe and Balfour Stewart, by Messrs. Macmillan. This we may well conceive to have been the most difficult of the series, having to do not so much with concrete facts as with abstract principles, which are infinitely less easy to make clear and to impress upon the youthful mind. That the author has made good the project with which he started we are hardly prepared to say. It is not every writer who would sit down to compress the first principles of philosophy into less than a hundred small octavo pages. But there is perhaps hardly another philosopher living who could have got into so slender a compass so much of the elementary truths of physics, with so consistent an illustration of the spirit in which all physical study should be carried on. In the concise and simple language of which he is a master, Professor Huxley draws the attention of young people to what is going on in nature round about them. He bids them in effect think for themselves, whilst helping them to form clear ideas of what really happens within or without themselves, of the forces which lead to such and such effects, and the laws to which they ultimately point. Starting from our first perceptions of things, he tells the beginner how to distinguish between cause and effect, showing that in the pursuit of the reason why, in following up the endless chain of causes and effects, lies the whole of knowledge, "which can never be complete, going at its best but a little way back towards the beginning of things." Science is no more than this simple knowledge or common sense made exact and reduced to system by means of observation, experiment, and reasoning. By these means in course of time men worked out for themselves the idea of the order of nature, seeing that things came about in regular sequence of cause and effect, by what are called "laws of nature." These laws are not in themselves causes, as the author points out in one of the best bits of compressed reasoning to be found in his masterly little book:—

In fact, everything that we know about the powers and properties of natural objects and about the order of nature may properly be termed a law of nature. But it is desirable to remember that which is very often forgotten, that the laws of nature are not the causes of the order of nature, but only our way of stating as much as we have made out of that order. Stones do not fall to the ground in consequence of the law just stated, as people sometimes carelessly say; but the law is a way of asserting that which invariably happens when heavy bodies at the surface of the earth, stones among the rest, are free to move.

The laws of nature are, in fact, in this respect, similar to the laws which men make for the guidance of their conduct towards one another. There are laws about the payment of taxes, and there are laws against stealing or murder. But the law is not the cause of a man's paying his taxes, nor is it the cause of his abstaining from theft and murder. The law is simply a statement of what will happen to a man if he does not pay his taxes, and if he commits theft or murder: and the cause of his paying his taxes, or abstaining from crime (in the absence of any better motive) is the fear of consequences which is the effect of his belief in that statement. A law of man tells what we may expect society will do under certain circumstances; and a law of nature tells us what we may expect natural objects will do under certain circumstances. Each contains information addressed to our intelligence, and except so far as it influences our intelligence, it is merely so much sound or writing.

While there is this much analogy between human and natural laws, however, certain essential differences between the two must not be overlooked. Human law consists of commands addressed to voluntary agents, which they may obey or disobey; and the law is not rendered null and void by being broken. Natural laws, on the other hand, are not commands, but assertions respecting the invariable order of nature; and they remain laws only so long as they can be shown to express that order. To speak of the violation, or the suspension, of a law of nature is an absurdity. All that the phrase can really mean is that, under certain circumstances, the assertion contained in the law is not true; and the just conclusion is, not that the order of nature is interrupted, but that we have made a mistake in stating that order. A true natural law is an universal rule, and, as such, admits of no exceptions.

Again, human laws have no meaning apart from the existence of human society. Natural laws express the general course of nature, of which human society forms only an insignificant fraction.

Having once mastered the rudimentary principle which thus lies at the threshold of nature, the pupil will be prepared to pass on to the special facts or phenomena with which science deals. He is made to see that all the phenomena of nature are either material or immaterial, physical or mental; the latter field of science being somewhat summarily treated in a mere couple of pages at the end of the book, the subject of psychology being, perhaps judiciously, reserved for a later stage in the learner's scientific growth. He will have enough to do in the first instance in making acquaintance with the nature and properties of the two great physical groups of mineral or inanimate bodies, and living or organic bodies. Of the former class the Professor takes water as that of which somewhat is known, however loosely, by everybody, and he seeks to make this knowledge exact and definite, whilst clear enough for the mind of every child. That water offers resistance, has weight, and is able to transfer motion which it has acquired, and is therefore a form of matter, is made to illustrate the meaning of weight or gravitation, of volume, mass, and density. The laws of fluid motion are deduced from the action of moving water, as are next the effects of heat and cold, which are shown to consist in violent disturbance in the molecules or atoms of water. The final lesson arrived at is that all matter may be regarded as made up of molecules or atoms in various combinations, for further acquaintance with which the learner is referred to his primer upon Chemistry. For special study of living bodies, he will in time have recourse to his manuals of Biology, Botany, and Geology. But he will here get his rudimentary ideas from the wheat plant as a typical sample of vegetable life, and from the common fowl as a familiar form of animal, the constituents of the body being shown to be very much the same in both, as well as, in their ultimate and most simple forms, the same as those of mineral bodies. To what, then, is the pupil to look as the dividing line between what were of old time looked upon as essentially distinct kingdoms in nature? This, we need scarcely say, is a problem not less wide and deep than that of philosophy itself. Suffice it for the beginner, that he is led to seek the traces of difference in the essential composition of these classes of natural bodies in the fact of their coming under the law of growth, and of that of reproduction by germs.

In *Practical Chemistry*, a volume about the same in bulk as Professor Huxley's, Professor Tilden aims at supplying the want, forced upon his mind by the requirements of his own teaching, of a book for beginners, based upon the consideration that it is by no means necessary to learn the properties of any large number of substances in order to master the principles of chemical analysis. To avoid loading the memory with details and clouding the mind with technicalities and complex terms, is of untold service to the beginner. He is first taught how to make himself familiar with the aspect and properties of a few substances with which he will be afterwards constantly dealing, such as water, the principal acids and salts, charcoal and sulphur, together with the use of the blowpipe, being shown how to make as far as possible his own instruments and conduct his own experiments. Having mastered the nomenclature of the elementary substances, and become familiar with the simple chemical formulæ, with the action of tests and the preparation of reagents, he is prepared for the practice of qualitative analysis, which forms the second and principal portion of the work. The use and value of the spectroscope is explained to him, and from detailed experiments for the detection of the chief metallic radicles in various compounds, he is furnished with general directions for analysing any unknown substance. An excellent tabular view gives additional clearness to the general directions laid down for the separation of the groups. The pupil who has made himself master of this little manual will be thoroughly equipped for the more advanced stages of the science and practice of chemistry.

A love of the study of light induced Mrs. W. Awdry many years ago to begin writing upon the subject, incorporating from time to time such new information as came within her reach. The result has been the little work before us, which sets forth, with as much fulness as may well be within such narrow limits, the first principles or initiatory mysteries of a science than which Newton has declared nothing to be more obscure. During the course of learning and teaching on this subject she was strongly impressed with the difference in power of sight which exists between trained and untrained eyes, as well as with the small amount of training needed to set the eye educating itself almost unconsciously in habits of delicate and accurate vision. She has not found costly and elaborate apparatus at all necessary for the primary course of lessons to which she here addresses herself; the few simple experiments described needing little more than three or four lenses of different powers, a piece of common glass and one of silvered glass, a prism and a tumbler of water. In the later chapters, which deal with spectrum analysis, the constitution of the sun and stars, and the heat and chemical action of the solar rays, a small direct-vision spectroscope is recommended. With the aid of these simple adjuncts and of appropriate diagrams, she enables the youthful learner to make out for himself the phenomena of refraction and reflection, to grasp somewhat of the undulatory theory of light, and the mode of measuring the velocity of light-rays and the rate of wave-vibrations. He will see how much science is to be learned from the fleeting colours of a soap-bubble or a bit of mother-of-pearl, and he will doubtless be surprised, when he comes to the chapter on diffraction, at the variety and beauty of the phenomena to be seen by simply looking between the fingers at any bright surface—a candle or a gaslight. The little work closes with a clear account of the rainbow, solar halos, and parhelia.

THE COUNTRY OF THE PASSION PLAY.*

WRITING books on districts of Europe which are easily accessible to ordinary tourists must always be among the most doubtful of literary ventures. For all depends on the manner of treating the subject, and the knack is neither to be acquired nor cultivated. Nor do we imagine that the undertaking is sensibly simplified even when the writer has been fortunate in selecting comparatively untrodden ground. For the manners depicted and the portraits of the natives can present but slight and insignificant variations from those that the travelled reader has had opportunities of observing elsewhere; while the happiest descriptions of unfamiliar scenery can seldom have much of the attraction of novelty. As for people who know little or nothing of the Continent, we fancy they seldom read such books at all; for, in the absence of the excitement of thrilling adventure, their charm must lie in the revival of pleasant associations. Occasionally a clever tourist makes a literary hit, either by the quaintness of his fancies or the brilliancy of his style, or by animating his volume with his personal individuality. And now and then we have an original genius like Heine, who only needs the inspiration of some casual impression to be philosophical or poetical, pathetic or sarcastic. Miss Seguin, who has undoubtedly found work that she does well, is by no means self-obtrusive, morally or otherwise, nor does she make pretensions to the genius of a Heine any more than she parodies his manner. She rather reminds us of Hackländer, as she has skirted or partly trodden his ground. Like Hackländer, she never lays herself out to be specially brilliant, while carefully avoiding the commonplaces of the guide-books, and like him, too, she keeps by preference to by-paths and back-of-the-world districts. Though we find that her unassuming descriptions have always a certain fascination for us, we can scarcely tell what makes them such agreeable reading. No doubt she paints prettily from nature; but the gift of delicate landscape-painting in pen and ink is by no means an uncommon one. We are rather inclined to attribute her success to the quickness of her many-sided susceptibilities and her readiness of sympathetic appreciation. She is quick to seize those salient features which strike the stranger in a primitive society; as she admires the beauties and grandeur of nature with an intelligent observation which notes all the details in their endless variety. Thus there is always a freshness in her sketches of character, and nothing conventional in her descriptions of scenery. On the whole, we prefer her *Country of the Passion Play* to the companion volume on the *Black Forest*. In the *Country of the Passion Play* she is more chary of relating legends which sound familiar in their stereotyped outlines, even when we have never heard them before; and her stories and historical allusions come in more naturally and effectively, for superstitions fill a considerable space in the fancies of a race of mountaineers who pass much of their lives in solitude, and whose minds have been influenced in the course of generations by the sombre sublimity of their immediate surroundings. Then death surprises them in startling and tragic shapes, leaving memories behind that are perpetuated by tradition. Here the avalanche descended on some hapless village; there, on the bosom of that mountain lakelet, a boat was swamped in some sudden storm; that wayside shrine was raised in gratitude for a great deliverance, and that cross was reared to commemorate a catastrophe. Nor have those out-of-the-way Bavarian Highlands been altogether neglected by history. Armies have marched and countermarched among the mountain-chains, whose valleys saw some sharp campaigning in the days of the First Empire; while trade routes have been carried over the passes from time immemorial between the wealthy free cities of central Europe and the flourishing trading ports on the Adriatic and Mediterranean. Altogether Miss Seguin finds profuse materials for embellishing the bare narrative of her Bavarian tours, and it is to her credit that she has employed them so picturesquely and judiciously.

Naturally she devotes some of her most interesting chapters to the lives and customs of those primitive mountaineers. Until very lately, when railways have been running up the courses of their rivers and bringing holiday-makers from the cities to summer resorts on their lakes, they lived in a variety of little valley worlds of their own, where they exercised, with the connivance of the central authorities in the capital, certain very extraordinary privileges of self-government. Most characteristic among these was the *Haberfeldtreiben*, or village lynch law—a kind of rough and summary justice visited on offences which were not positively criminal. The culprit was judged and condemned—in his absence, as we presume—by a general consent of local opinion. Sentence was passed and the executioners appointed. Then his house was surrounded in the night by a masked and armed band, who called him forth for punishment. He was beaten, ducked, or merely reprimanded, as the case might be. Resistance was idle, and revenge unheard of. For revenge would only have led to more severe retribution, and there was no place of refuge open to a man whose little world lay enclosed by the mountains round his village. Even in these days the highlander, though a fine fellow physically, has done little towards refining himself or cultivating his intelligence. His occupations take him for long hard days of work into his patch of allotment ground or into the solitudes of the forests; and his amusements are chiefly dancing, in which he delights, and gossiping over his pipe of an evening in the beerhouse. It is the more singular that the Bavarians as a race should display such remarkable dramatic abilities; for though the art has been brought to a climax by the villagers of Ober Ammergau, they are by no means exceptional in their histrionic talents. Not a few of those secluded villages have their standing wooden theatres, where pieces that may be either secular or religious are acted at intervals all the year round. The Bavarian is playful, too, in his ponderous way. A popular figure in the village dance says much for the sturdy *physique* of the people; in this strange performance the male dancer finishes with a bound in the air, and, resting head and hands on the shoulders of his fair partner, beats a tattoo on the ceiling with his bootsoles in quick time to the music. And the training of the girls is calculated to make them robust and self-reliant as well. It is difficult to conceive a more unnatural life for a young woman than that led by the *Sennerinn*, or herd-girl, for at least three months in every summer. Each peasant proprietor has his stretch of pasture on the mountains, as well as his plot in the valley; and to the former the cattle are driven each year when the mountain grass becomes luxuriant. The solitary girl is sent in charge, and there she remains under the same roof with the cows, who are her sole company for six days out of the seven. The cheese-making pretty amply occupies her in the daytime, and we doubt not that she sleeps soundly after her labours. But not the less does she look forward to the seventh day, when she invariably may count upon a visit. For it is *de rigueur* that each *Sennerinn* should have her "young man," and the long flirtation with the young lady in the mountains is the duty and pleasure of each summer Sunday. When she leads down her flock decked out with flowers at the end of the season, and the village society turns out to welcome her, the lover gives a visible symbol of his allegiance by presenting her in public with a bouquet of wild flowers. But sentiment stops short with these tender preliminaries, which, by the way, are hardly conducive to rigid morality. The subsequent marriage is as much a matter of bargain and barter as any arranged among the mansions of Belgravia. Stock is previously taken of the goods on either side; and the bride drives herself to the dwelling of the bridegroom seated on a pile of "plenishing" which forms part of her dowry, and includes a cradle among the other articles.

But it is time to pass from the people to their country, and to Miss Seguin's practical hints for tourists. In the first place, she describes the scenery as most fascinating. If it is on a less magnificent scale than that of the Swiss mountains, she thinks that on the whole you may have more real enjoyment in it:—

> Though the actual height of the mountains may be less, the valleys which intersect them are cut so deeply into their heart, and are yet themselves at so great an elevation, that the traveller who makes his headquarters at the modest Bavarian village inn is brought, as it were, face to face, with the giant children of nature. He lives absolutely among them. They look at him through the window panes as he sits, or writes, or reads. He becomes intimate with them, and takes to calling them familiarly by name, as though each snowy, tapering peak were in reality an old and valued friend.

As for the modest inns, they are very far from being uncomfortable; and, on the strength of some personal experiences, we can confirm all that Miss Seguin says in their favour. The beds are clean, if the bedrooms are bare; the board is amply spread with good substantial fare, which is sure to be sauced by a sharpened appetite; and though we decidedly differ from our author in the pre-eminence she assigns to the beer, yet the thirsty tourist must be fastidious indeed who grumbles either at the flavour or the quality. But, according to Miss Seguin's reports, which give us the latest information, the accommodation must have greatly improved since our time. There were always rival establishments more or less pretentious on the Tegernsee, the Starnbergersee, and other picturesque and accessible neighbourhoods which were much patronized by the citizens of the capital. But now, with the opening of the new railway lines, houses of the kind seem to be springing up on the shores of lonely mountain tarns and on those higher slopes of Alpine solitudes which used formerly to be abandoned to the herdsmen and foresters. In these days, so far as we can gather from Miss Seguin's pages, one might easily make a tour from hotel to hotel without once having occasion to rough it in one's sleeping quarters. Not that we by any means recommend such short-sighted Sybaritism. There are other luxuries in magnificent mountain scenery besides the luxuries of bed and board; and one of the chief of these is being absolutely independent and wandering about at your own caprice. The exercise of a very moderate amount of forethought will usually assure you tolerable quarters; and if for a single night you should have serious grievances you will be all the happier at your next halting-place for the contrast. For which reason, also, we strongly advocate doing a great deal of pedestrianism; though that is of course by no means always practicable for a lady. Transporting oneself by the public conveyances in Bavaria, as generally in the picturesque districts of the Continent, is quite out of the question. As Miss Seguin points out, both in this volume and in her *Black Forest*, they are almost invariably timed to start in the evening, so as to take you through the finest scenery in the dark; while you see little at the best of times from the *coupé* or interior, and are suffocated with dust in the open banquette. Carriages, no doubt, may be hired in many places. But the German coachman is the most phlegmatic of drivers and the least exhilarating of guides and travelling companions. He smokes perhaps the worst tobacco in the world, keeps his pipe of china perpetually in full blast, and is less scrupulous as to changing his underclothing than might be desirable in sultry summer weather. You walk up the steep ascents for your

---

* *The Country of the Passion Play: the Highlands and Highlanders of Bavaria.* By L. S. Seguin, Author of "The Black Forest," &c. London: Strahan & Co. 1880.

own sake; he insists on your getting out where the mud is deepest; and, except that he relieves you of all anxiety about your baggage, you had better have dispensed with his services, were it not for the honour of the thing. Our advice is to go on foot in a country like the Bavarian highlands; to forward your portmanteau from point to point, slinging the scantiest of travelling necessaries in the lightest of knapsacks; and so far as scenery, and even decent night quarters, are concerned, plan your wanderings as you will, you can hardly go wrong.

THE DUKE'S CHILDREN.*

MR. TROLLOPE, in his biographical notice of Thackeray contributed to Messrs. Macmillan's series of *English Men of Letters*, is led incidentally, but in perfect relevance with his main subject, to give some hints as to his own method of work. Thackeray, having undertaken the editorship of the *Cornhill Magazine*, had intended to begin the first number with one of his own "great novels," but characteristically had put it off till too late, and in the dilemma asked Mr. Trollope to furnish him with a "long novel" to supply its place. This letter was accompanied by one from the publisher, who suggested "some interesting details as to honorarium." The little details, he goes on to say, were very interesting; but absolutely no time was given. It was required that the first portion of the book should be in the printer's hands within a month. Now, he goes on to say, "it was my theory, and ever since this occurrence it has been my practice, to see the end of my own work before the public should see its commencement. If I did this thing I must not only abandon my theory, but instantly contrive a story, or begin to write it before it was contrived. That was what I did, urged by the interesting nature of the details. A novelist cannot always at the spur of the moment make his plot and create his characters who shall, with an arranged sequence of events, live with a certain degree of eventful decorum through that portion of their lives which is to be portrayed." He informs the reader in conclusion that the novel (*Framley Parsonage*) written in defiance of this rule was received with greater favour than any he had written before or since, which he justly attributes to the prestige of a new magazine under Thackeray's editorship; for, though the novel is clever, it does not stand in the first rank among his very best. Mr. Trollope modestly attributes the sudden appeal made to him to his readiness rather than to any other gift; but the reader must feel that Thackeray was very fortunate in finding such a substitute. Our reason for referring to this history is the light it throws on the author's method of work. It certainly seems the right course for a novelist to form his plot and contrive his scenes before he puts pen to paper; though many a successful novel shows the writer to have been carried away by characters or incidents that grow upon him in the handling, as fitting his genius, till they fill a space that can hardly have been designed for them in the first outline. But the plan of working out the course of the story through all its windings and complications, and giving each personage an appointed share of work, leaves room for a sort of division of labour which is very convenient where a certain amount of work has to be performed, but through which some scenes must inevitably come off worst, as not being allowed their fair chance. There are scenes which, as the writer foresees, must be carried through when the powers are at their freshest; there are others necessary for the conduct of the story where he may trust to his practised pen for supplying the needful effects. We are disposed to think that the passages which convey Mr. Trollope's impressions of feminine constancy as a blind instinct, wherein the lady regards her lover as a god, sees him handsome as a god, or beautiful as a god, and has "taught herself" a certain number of obstinate resolutions on his behalf, are passages in which the author's genius takes its repose. Young people, who constitute the mass of novel readers, must have a certain amount of love-making; they are not supposed to be critical as to the quality, if only it is determined enough; and as Mr. Trollope's ladies possess this quality of constancy, and have the formula by heart, to them is given the task—easy and familiar to the author—of filling the given number of pages where love is the theme. There are other scenes, on which the distinctive character of the novel depends, which are to be carried through by the personages who have suggested the story, and on whom the writer depends for interesting readers whose judgment he respects; these he works upon when his faculty of imagination, his knowledge of human nature and experience of the world, are most at his command, and are suffering least under the strain of perpetual composition.

In the *Duke's Children* there are three characters who have employed the author's powers with more or less success. The other personages fill their respective parts, the Duke's eldest son perhaps with most of the conventional cleverness always at the author's command; but these three supply the motive of the story; the Duke of Omnium—our old friend Mr. Palliser, the husband of Lady Glencora—occupying the leading place in our interest and regard. The Duke is the only person who speaks with dignity, or does any credit as far as this point is concerned to his lofty pretensions and high descent. The Duke talks sententiously, lectures his sons in sentences that read like a book, and yet he is the only one who to our mind talks naturally, for well-formed sentences are natural to his character and circumstances. The matter and the manner go well together. In this point of talk and expression there are three degrees of naturalness. The Duke talks not only as he thinks, but as he might speak. The rival heroines, Lady Mabel Grex and the American beauty, talk as they might think, but certainly not as they would speak; the rest vaguely indicate rather than express any exact meaning in the slang of the period, if we except two ladies of a certain age filling secondary parts, who talk sense in judicious language when the plot requires it. The stirring scenes of the book are conducted by the young ladies, who act according to our second standard. The author evidently supposed himself justified in making them say the things they do say, because it is quite possible they might *think* them. But surely to say what you think is in many cases the most unnatural thing in the world. The words which Mr. Trollope puts into the mouths of his candid young ladies too frequently strike the reader as out of all nature or possibility, as almost monstrous when addressed to the ears which receive them, and as certain to produce an effect upon any mortal hearer the absolute contrary of that aimed at.

One of these candid speakers, Lady Mabel Grex, is drawn with some care; as an aristocrat of bluest blood, she illustrates the demoralizing influences incident to her class. In her case there have been no counter-influences at work. The various moods of her impulsive nature, her alternations of sentiment and worldliness, fill many scenes; she is so far in the author's good graces that, having in early girlhood given her heart to a poor man, her love for him suffers no abatement to the end; but, by her own act and deed, she had renounced her lover because he was poor, and throughout the book she sets herself in wayward fashion to win the heart of Lord Silverbridge, the heir to the dukedom, playing with the prize when it seemed within her power, and making desperate efforts to secure it when too late. Her original lover, man-like, has accepted his dismissal, has agreed that they shall be friends and nothing more, and fallen in love with the Duke's daughter, which of course is very disagreeable to Lady Mabel; and whenever she encounters the recusant she reproaches him for his inconstancy, at the same time announcing her designs upon Lord Silverbridge and requiring his aid with an unveiled frankness which is impossible in a person with so much that is interesting in her as the author would have us suppose. Mr. Tregear, the quondam lover, on this announcement, has felt himself at liberty to request her aid in the matter of his engagement with Lady Mary. But she recognizes no parity of obligation, asks him what Lord Silverbridge would think if he found them together, and finishes the colloquy with this avowal:—"You know I love you with all my heart, with all my strength, and that I would give all the world to cure myself." In another place we find her view of female constancy explained. "A jackal is born a jackal, and not a lion," she says to her once lover. "So is a woman born a woman. They are clinging parasite things which cannot but adhere, though they destroy themselves by adhering." Now, whatever the lady might have thought, could such a woman as we are intended to think her have said this under the circumstances? A very trying, embarrassing person she certainly would be, not only to the man she loves but to the man she means to marry. Poor Silverbridge has a hard time of it under her reproaches at his desertion. She goes so far as to remind him of certain occasions on which she had asked him to take her as his wife, and finishes at last by informing him that "in truth, I have never loved you."

Her rival, the American beauty, sins against probability, it seems to us, quite as much, though in a different strain. Miss Boncassen is represented as perfectly charming. Her beauty is more perfect than Lady Mabel's; her complexion has a brilliancy and transparency that is dwelt upon as a national characteristic; her manner is universally bewitching. Now it is quite possible that an American girl fresh from New York, in all the excitement of finding herself courted and admired in English aristocratic circles, might have thoughts that would not bear expression. We can imagine her saying to some confidante that it is amusing to be in the circumstances touched on in the sentence we are about to quote; but we cannot understand a girl of any propriety of feeling or any sense saying it to a young lord very early in their acquaintance; nor can we imagine the young lord thinking it attractive—even though, in contrast with both father and mother, she did not talk in the least through her nose. However, it told very favourably on him that she should immediately on their acquaintance thus introduce the subject of love-making:—

> Miss Boncassen, at any rate, did not laugh at him, and then she was so pleasant, so full of common sense, and so completely intelligent! "I like you," she had said, "because I feel that you will not think that you ought to make love to me. There is nothing I hate so much as the idea that a young man and a young woman can't be acquainted with each other without some such tomfoolery as that."

And she is so well pleased both with the topic and the wording that she reminds him of it afterwards, looking him steadily in the face. To another lover, who pesters her with offers, she talks about her petticoats spoiled in the rain; "new things are such ducks." She rings the bell for iced water, and in the hotel waiter's presence suggests to him, "Perhaps you'd like soda-and-brandy," and then jumps up, looks out of the window and cries, "Oh laws!" To a girl endowed with manners so frank, we need not wonder that Silverbridge ventured to repeat his own opinion of her as expressed to a lady, whom, by the way, Miss Boncassen had defined as an "old harridan." "I swore that I was awfully in love with you." "You didn't." "I did; that you were out and away the finest girl I ever saw in my life."

* *The Duke's Children.* By Anthony Trollope. London: Chapman & Hall, Limited. 1880.

We cannot say that we care very much for the sorrows and loves of the young people whose function it is to exercise the temper, to try the patience, to test the principles of our old friend, now Duke of Omnium; but they do effect these necessary ends. The Duke represents the struggle between the old aristocratic sentiment and modern liberalism. The conflict in his case is between pride of birth, the sense of nobility, a long ancestry, a great historical position, and the opposition to all these feelings which distinguishes the party of which he is nominally the head, and whose principles he has to advocate. The American girl, who has resolved not to marry the young lord without the consent of his father, has a conversation with the Duke at a country house where both are visitors, in which she sounds him:—

"We are so different from you," she said, speaking of her own country. "And yet so like," said the Duke smiling, "your language, your laws, your habits."

"But still there is such a difference! I do not think there is a man in the whole Union more respected than my father."

"I daresay not."

"Many people think that if he would only allow himself to be put in nomination he would be the next President."

"The choice I am sure would do your country honour."

"And yet his father was a poor labourer who earned his bread among the shipping at New York. That kind of thing would be impossible here."

"My dear young lady, there you wrong us."

"Do I?"

"Certainly! a Prime Minister with us might easily come from the same class."

"Then you think so much of rank; you are—a Duke."

"But a Prime Minister can make a Duke; and if a man can raise himself by his own intellect to that position no one will think of his father or grandfather." . . . He in all this was quite unconscious of the working of her mind. Nor in discussing such matters generally did he ever mingle his own private feelings, his own pride of race and name, his own ideas of what was due to his ancient rank, with the political creed by which his conduct in public life was governed. . . . But there was an inner feeling in his bosom as to his own children and his own personal self, which was kept altogether apart from his grand political theories. It was a subject on which he never spoke, but the feeling had come to him as a part of his birthright. And he conceived that it would pass through him to his children after the same fashion.

The reader feels really grateful to Mr. Trollope that his tenderness towards his own creation prevents him from exposing the Duke to deeper trials than he encounters in the present story. Tregear is a gentleman. Lady Mary is quite as determined a character as that Lady Anna of one of his recent novels who married a tailor; and on whomsoever her choice had fallen the Duke would have had to give way.

The scrapes of the Duke's sons are more in the ordinary course of things. Silverbridge loses seventy thousand pounds, and the younger brother four thousand, by betting and gambling. A Major Tifto who assists in these affairs is drawn with knowledge, and gives point to several of the scenes. Whether in the club, or the racecourse, or the hunting field, he is recommended to the reader as something above a mere swindler by becoming the victim of a more thorough rogue than himself. The sons very properly pronounce their father a brick and tip-top, for he pays their gambling debts at the expense of stern lectures, softening off at the end into Latin quotations. "You should have heard the Governor spouting Latin," writes Lord Gerald to his brother, congratulating himself at having gone slap at his confession. "If there is anything that never does any good it is craning. I did it all at a rush, just as though I was swallowing a dose of physic." And thus the young men escape the insidious blandishments of Messrs. Comfort and Criball. There is no doubt that the Duke under a cold exterior is the most amiable of men, superior in all respects to his children, and finding very little pleasure or prospect of satisfaction in them; so that the main interests of the story are more or less sad. He is throughout a sufferer. Therefore, whatever the views of the reader, none will grudge him his return to power as the story closes, or will seriously object to Silverbridge's penitent return to the family politics, after starting in political life in direct opposition to his father, though he comes round at last upon no higher ground than that his leader, Sir Timothy Beeswax, is "such a beast, you know."

CLASSICAL BOOKS.*

THE classical texts and elementary helps and introductions to the grammar and syntax of the learned languages which nowadays issue from the press are numberless. We have now before us two notable editions of a Latin comedy and a Greek tragedy respectively; two introductions to the study and practice of Latin verse and Greek iambic; and three contributions, in the nature, more or less, of primers, to the endless problem of Greek or Latin grammar, on which it really seems as if every new teacher had a new doctrine to propound. There is this strong recommendation to such a work as Mr. Sonnenschein's *Captivi* of Plautus, that no student can read the play carefully and with diligent heed to its illustrative, textual, and critical notes without finding his views of Latin grammar and philology appreciably enlarged. The piece is judiciously chosen. There is always in Plautus enough humour to make his scenes readable; but in this play pre-eminently the humour has nothing gross in it; the plot is lively, the interest sustained, and the tiro has every inducement to stick to his task until he reaches its close. We agree with Mr. Sonnenschein that, on the whole, no better foreign editor than Dr. Julius Brix could have been chosen on whom to base his edition. In truth, it is a great proof of the soundness of that learned German's judgment that our latest English editor of a play of Plautus finds so much in which he can conscientiously endorse him. Mr. Sonnenschein founds his text on collations of the *Codex Vetus* for which he is indebted to Ussing's collation, supplemented by reference to Pareus; and of the *Codex Britannicus* made by himself. His "Critical Apparatus" has had the advantage of a number of emendations by the great Richard Bentley, approved as genuine by their manifest value, and now published for the first time from the margin of a copy of Pareus in the British Museum. The editor notes that these Bentleian readings generally come nearer the MSS. than those of Dr. Brix, to whom and to Ussing and others he acknowledges his debt. Like most recent workers in the field of Latin comedy, he has availed himself of Brix for the material of his introduction to Plautine prosody, except as relates to the subject of Hiatus. His second edition, now before us, is enhanced by a valuable excursus "On the Critical Value of the *Codex Britannicus*," and an appendix containing Bentley's emendations on the other plays of Plautus. Since the publication of Mr. Lucas Collins's Plautus and Terence in "Ancient Classics for English Readers," it would be an especially gratuitous waste of labour to give even a sketch of the plot of the *Captivi*, which depends mainly for its interest on the natural delineation of paternal affection and staunch friendship. Much of the interest is consequently pathetic; though the introduction into several scenes of the parasite Ergasilus is comic enough where it occurs. Another feature in the play is the introduction of so-called "Cantica," which seem to have been not strictly choral monologues, but scenes in longer and more passionate metre, probably with musical accompaniment. Our glances at the notes of Mr. Sonnenschein's commentary must be brief, but we may notice a passage in the prologue which shows how on the old Latin stage familiarities were in vogue such as may be heard now on the Italian. The prologist asks, "Do the audience understand the plot so far?" Apparently most of them do. But

> Negat hercle ille ultimus: accedito.
> Si non ubi sedeas locus est, est ubi ambules,
> Quando histrionem cogis mendicarier.
> Ego me tua causa, ne erres, non rupturus sum.

This our editor explains as follows:—"I declare there's one in the furthest row says 'No': let him draw nearer. If you've no sitting room, there's room for you to take a walk (outside). You must be off, or you'll drive the actor to play the beggar (*i.e.* solicit individual assurance that he makes himself heard). I'm not going to crack my lungs for your sake, don't think it." It is a plausible theory that in "est ubi ambules" there is a reference to the "ambulacrum," or open promenade; but Bentley's emendation on Ter. *Haut.* Prol. 31, "discedito" for "accedito," is, we are told, needless, if we understand a short pause after "accedito." And the literal interpretation of "mendicarier," espoused by Geppert and Brix, strikes us as tame and improbable. At every turn of the commentary the reader finds some analogy of language illustrated; *e.g.* in i. 1. 37, Nimis quam, *excessively*; cf. *Most.* ii. 2. 78, Nimis quam formido; compare Greek ὑπερφυῶς ὡς; and in i. 1. 37, *Ille demum*, he *and none but he*, where Sallust's *Catiline*, 20. 4, Ea demum firma est amicitia, is a case in point, exhibiting *demum* first of time in the sense of "only." In i. 11. 55, "Iam maritimi omnes milites opus sunt" gives a good instance of "opus sunt" used adjectively, cf. Cic. *De Invent.* 2. 19, and Madvig § 266. In Act ii. 1 the form *nunciam* is traced not from nunc jam, but from *nunci*, as "quom" from "quoni." "*Nunciam* is exactly parallel to *quoniam*, the -*am* in either case being an adverbial ending, giving an emphasis to the word to which it is attached." We could have wished, however, a fuller

quite satisfied with the explanation that "*resident* = *quiescunt* with acc. governed on the notion of *agere*, which it contains." We cordially recommend this well-equipped play both to younger and older students of Plautus.

Mr. Kynaston's graceful and finished renderings of English verse into Latin hexameters, elegiacs, alcaics, and sapphics will raise the reputation of Cheltenham scholarship. Each exercise has been set for composition to his head forms, and its aptitude for translation tested by himself *pari passu*. He has put forth these examples without note, comment, or introduction, and, in truth, they tell their own tale. We would point to the first example, an alcaic rendering of Sir William Jones's "What constitute a

* *T. Macci Plauti Captivi.* With an Introduction, Critical Apparatus, Explanatory Notes and Appendix, &c. Edited by Edward A. Sonnenschein, M.A., late Scholar of University College, Oxford. New Edition. London: Swan Sonnenschein & Allen. 1880.

Exemplaria Cheltoniensia sive quæ discipulis suis carmina identidem reddenda proposuit ipse reddidit, ex cathedra dictavit Herbertus Kynaston, A.M., Collegii Cheltoniensis Præses. Londini: Apud Macmillan et soc. 1880.

Cambridge Texts, with Notes.—Agamemnon of Æschylus. By F. A. Paley, Classical Examiner to the University of London. Cambridge: Deighton, Bell, & Co. London: Whittaker & Co.; G. Bell & Sons. 1880.

Exercises in the Composition of Greek Iambic Verse, by Translation from English Dramatists. Arranged by Herbert Kynaston, M.A., Principal of Cheltenham College. London: Macmillan & Co. 1879.

A Child's First Latin Book. By Theophilus D. Hall, M.A., Fellow of University College, London. New and enlarged edition. London: John Murray. 1879.

First Latin Grammar. By M. C. Macmillan, M.A., Assistant Master in St. Paul's School. London: Macmillan & Co. 1879.

state?" &c.; to another, also alcaic, rendering of Tennyson's "I sung the joyful Pæan clear," and to an elegiac version of Sir Henry Wootton's "Ye meaner beauties of the night," as illustrations of a practised mastery of both the translated and the translating language. Two couplets perhaps are specially worth notice. The last-named passage of Wootton ends:—

So when my Mistress shall be seen
  In sweetness of her looks and mind,
By virtue first, then choice, a queen—
  Tell me if she were not designed
The eclipse and glory of her kind.

This is most happily rendered:—

Haud secus, ingenio et specie cum prædita dulci
  Prodierit dominæ gratia visa meæ,
Quam sua regali virtus dignatur honore
  At majora suis regna fatetur Amor—
Scilicet hanc nemo Superos jussisse negabit
  Fulgori generis prænituisse sui.

Another similarly neat and thorough version is the last but one in the book, an elegiac copy of an epitaph so often cited that, though anonymous, we fancy most lovers of poetry can recall its words or its place in literature by the first line, which runs "Fair marble tell to future days," &c. The Latin transcript deserves close comparison:—

Hoc ventura legant in marmore sæcla, sororum
  Sub sacro innuptum par recubare solo.
Lingua hominum laudes vivarum nulla tacebat;
  Sublatis, nullæ non induere genæ.
Corpore præstanti, famaque, et dulcibus annis
  Dum crescunt, similis crevit utrique nitor.
Par adeo species miram rem prodidit, ut Mors
  Unam crediderit, sustuleritque duas.

We need not dwell long on a new volume of Cambridge Texts, the *Agamemnon* of Æschylus, edited by a veteran such as Mr. Paley, whose first published labours on Æschylus cannot be dated less than thirty-five years ago. The appearance of Dr. Kennedy's edition in 1878 showed the general confidence of that eminent master and professor in the Æschylus of Paley as found in the *Bibliotheca Classica*. We are glad to have from Mr. Paley's hand this year an *Agamemnon*, with brief notes, which represents the editor's latest judgments on all the interesting points of which this admirable drama is full to overflowing. Thus at the very threshold of the work, on

γυναικὸς ἀνδρόβουλον ἐλπίζον κέαρ,

So firm in its resolve is the manly counselling hopeful heart of a woman,

he suggests a secondary sense, or an intentional ambiguity in the epithet *ἀνδρόβουλον*, which the spectators would understand to involve the less obvious meaning "having plans about a husband." It is, indeed, in divining these casual double meanings that the pleasure of reperusing the *Agamemnon* largely consists, and for clear and compendious guidance in this process Mr. Paley's little volume will be found as suggestive as it is sound. In a speech of Clytemnestra, a little before Agamemnon's entrance (570 *seq.*), she is found exulting that her confidence, expressed in v. 10, was not misplaced; and a subsequent line (580), *θυηφάγον κοιμῶντες εὐώδη φλόγα*, which helps to define the ceremonies attending the exhibition of this exultation, tells how a part of them consisted "in lulling to rest in shrines of Gods the incense-preying odorous flame." Here Mr. Paley renders the passage clearer by inferring from the description of the company "as they watched the fragrant flame burning itself out," that "the shout was raised not only at the fall of the victim, but as the last flame disappeared from the altar. It was probably a ceremony at the concluding of the sacrifice when the company was dismissed."

To the accomplished Principal of Cheltenham College, whose "Exemplaria" we have already noticed, we are indebted for a valuable and not too rudimentary volume of practical exercises in the composition of Greek Iambic verse. Mr. Kynaston limits his elementary hints on quantity, prosody, language, and syntax to some half-dozen suggestive pages, and devotes the rest of his book to translations from English dramatists in two parts; the first followed by a copious vocabulary, calculated to serve instead of an English-Greek Lexicon, which indeed would be hard to find; while the second part is armed with "an index of phrases and combinations connected with nouns representing leading ideas," and appears well calculated, with access to a Lexicon where needed, to supply the zealous student with all the verbal help he can require. Wherever we have tested him we have been struck with the amount of practical help which he has thrown into a limited space. Mr. Kynaston acknowledges his obligations to Mr. St. John Thackeray, and Mr. Sandys, the Public Orator at Cambridge, for the use of some of their translations, and a still larger debt to Dr. Herbert Holden's invaluable *Folia Sylvulæ*.

Mr. Gunion Rutherford's *First Greek Grammar*, of which we had a word to say in its first edition, now reappears in an enlarged and improved form. It aims at supplying for beginners an accurately compiled drill-book, a second part containing remarks and additional matter on the forms included in the first. Mr. Rutherford adopts the stem system of inflection, and is throughout commendably clear and succinct. Chapter V., on "Accentuation," will be found a *multum in parvo* which is within the grasp of any intelligent tiro handled by an earnest teacher.

Mr. T. D. Hall's new and enlarged *Child's First Latin Book* has been subjected to considerable recasting and improvement since its first appearance. He has judged well in detaching the "new pronunciation section," pp. 1-6, from the body of the work, and confining it to the introduction, and not less so in relegating the vocabularies to the end of the book. The treatment of adjectives of the first and second declensions has been rightly postponed till after the nouns of the same. The work has also been extended to take in the active verb, with exercises on each conjugation to match. We may add that, in consideration of what may be termed, in those modern days, old-world teachers—still a large number—a quasi-appendix, at the end of the book, gives all paradigms of nouns, adjectives, and pronouns, with the cases arranged as in the old grammars. This concession is as wise as charitable. One excellent feature of Mr. Hall's enlarged *Child's Latin Book* is the array of questions, as well on the nouns, adjectives, and pronouns, as on the active verbs. The exercises, too, are duly progressive, and adapted to the beginner's capacity.

Yet another *First Latin Grammar*, by Mr. M. C. Macmillan, M.A., deserves brief notice for its workmanlike relegation to the end of the book of such matters as the Latin declension of Greek words and the computation of time, money, and numerals. He has adhered to the traditional number and order of declensions and conjugations, and followed Mr. Roby's arrangement by stems, which he deems more satisfactory than any other. With syntax in this manual he has not dealt, because he aims at impressing on mere beginners a knowledge of grammatical forms rather than at including progressive exercises which would have to illustrate syntax. Among the chief boons of this new grammar we decidedly count the appendices.

MINOR NOTICES.

WE could wish that all those rough-and-ready critics who object to an exact and chiselled form in verse, on the ground that the box so carefully wrought must contain bad spikenard or no perfume at all, would read Mr. A. Lang's *Ballades in Blue and White China* (1), where a singular perfection of technique is wedded to the most genial and healthy ideas, fresh and wholesome fancy, and a delightful vein of humour. About ten years ago Mr. Lang published a volume of *Lyrics of Old France*, in which he showed himself a lover of all beautiful and intellectual things, but where his verse was not without a sign of the influence, then so widely diffused, of the brilliant and overstrained poetry of Mr. D. G. Rossetti. The author shows in his new book that he has thrown this borrowed manner entirely aside, and is master of his own music. There is the true ring in his delicate verse, and in his graver moments he reminds us of the best of those Italian lyrists who wrote in Latin just as Latin was ceasing to be the literary language. Like these men, like Naugerius or Flaminius, he has a happy power of crystallizing his impressions of life and of his favourite employments in a style that makes up for its lack of startling originality by its delicacy, purity, and sincerity, retaining all the while a certain conscious relation to recognized literature. There is nothing forced or exaggerated in tone about these little poems, and they fulfil their dainty mission to perfection. The humorous and satiric ballades are admirable. There are one or two in Lowland Scotch which leave nothing to be desired. We give a "Ballade of Bookhunters," as a specimen of the literary flavour of this little volume, to the charming binding and type of which we must add a word of praise:—

In torrid heats of late July,
In March, beneath the bitter *bise*,
He book-hunts while the loungers fly,—
He book-hunts, though December freeze;
In breeches baggy at the knees,
And heedless of the public jeers,
For these, for these, he hoards his fees,—
Aldines, Bodonis, Elzevirs.

No dismal stall escapes his eye,
He turns o'er tomes of low degrees,
There soiled romanticists may lie,
Or Restoration comedies;
Each tract that flutters in the breeze
For him is charged with hopes and fears,
In mouldy novels fancy sees
Aldines, Bodonis, Elzevirs.
With restless eyes that peer and spy,
Sad eyes that heed not skies nor trees,
In dismal nooks he loves to pry,
Whose motto evermore is *Spes!*
But ah! the fabled treasure flees;
Grown rarer with the fleeting years,
In rich men's shelves they take their ease,—
Aldines, Bodonis, Elzevirs!

ENVOY.

Prince, all the things that tease and please,—
Fame, hope, wealth, kisses, cheers, and tears,
What are they but such toys as these—
Aldines, Bodonis, Elzevirs?

There has now appeared a third volume of Sir Travers Twiss's text and translation of Bracton (2). It is advertised as "a

(1) *XXII Ballades in Blue China.* By A. Lang. London: C. Kegan Paul & Co.

(2) *Henrici de Bracton de legibus et consuetudinibus Angliæ libri quinque in varios tractatus distincti. Ad diversorum et vetustissimorum codicum collationem typis vulgati.* Edited by Sir Travers Twiss, Q.C., D.C.L. Published by the authority of the Lords Commissioners of her Majesty's Treasury, under the direction of the Master of the Rolls. London: Longmans & Co., &c.

new edition of Bracton's celebrated work, collated with MSS. in the British Museum, the Libraries of Lincoln's Inn, the Middle Temple, and Gray's Inn, the Bodleian Library, Oxford, the Bibliothèque Nationale, Paris, &c." In our notices of the first two volumes we showed at some length in what fashion this professed collation has hitherto been performed. In the present volume there are signs of something like a real collation of the Oxford MSS., but little or nothing to show any serious use of the others. Beyond this improvement, which is a good thing as far as it goes, there is nothing particular to be remarked about the execution of the work. The Latin text is, as before, disfigured by the contractions of the old printed book, which have not the slightest palæographical or critical value. The saving of space is not, or at least ought not to be, an object in a publication of this kind; and we can therefore only guess that this slovenly proceeding is adopted to save a certain amount of trouble in writing out the contracted words. As to the translation, we have not lighted on anything quite so bad as occurred in the former volumes; but "he will have to be adjudged the possessor," for *pro possessore erit judicandum* (fo. 213 *b*)—*i.e.* "judgment must go for the party in possession"—is a schoolboy's blunder, or rather a blunder which no fairly-instructed schoolboy ought to make. As to the introduction, we confess that when an editor can gravely speak of the mass of confusion with which Mr. Finlason has overlaide Reeve's *History of English Law* as a "valuable edition . . . enriched with a series of learned notes and comments," we do not think it profitable or desirable to spend much more time in examining that editor's contributions to our historical or critical knowledge. We may add that we have lately seen the very fine MS. of Bracton in the National Library at Paris. Its text appears, as we expected, to agree substantially with that of the best English ones; and comparison of some of the British Museum MSS. in test passages, which we discussed on a former occasion, confirms this result as regards the general *consensus* of MS. authority. We strongly suspect that the old edition of 1569, which is devoutly reproduced by Sir Travers Twiss with all its faults and the addition of some new misprints, owes the greater part of its corruptions to no more ancient or respectable source than the carelessness of the publisher and printers; and we believe that a good text of Bracton might be obtained by taking as the foundation any one of some half-dozen MSS. (British Museum, Oxford, Cambridge, or Lincoln's Inn), and editing the text of the chosen MS. with occasional correction, where needed, from others. This, unfortunately, is just what Sir T. Twiss has not done; he considers the old printed text as "classical," and will not disturb it even when he has not overlooked an obviously right MS. reading. According to this doctrine, any edition whatever of an old author, however badly done, becomes classical if a century or two passes without anything better being produced; and Sir Travers Twiss's own astonishing renderings of certain passages of Bracton's Latin will be a classical version for our great-grandchildren. Again, we have given proof that Sir T. Twiss's collation even of the MS. he has himself picked out as surpassing all others by the "extreme purity" of its text is not to be relied upon. It may be as well to refresh our reader's memory by repeating shortly the nature of the facts on which this inference is founded. Sir Travers Twiss edited and translated without a word of remark passages which as they stood made absolute nonsense; which had been already pointed out as manifestly corrupt by a writer whose work was in Sir T. Twiss's hands; and of which the true reading was in fact given in all or most of the MSS. which he professed to have collated. No explanation of this proceeding is forthcoming, and the absence of it throws suspicion on the whole of the work, apart from other signs of carelessness, and the haste with which it has been produced. It is only too certain that, if we are ever to have an edition of Bracton worthy of the subject and of English scholarship, the whole thing will have to be done over again. Unhappily it is by no means probable that any of the few persons or bodies for whom such an undertaking is practicable will be disposed to take it up. The only hope, and a distant one, is that some day one of the Universities may be moved to action. Oxford has excellent materials for forming an improved text of Bracton, which have been used, to say the least, inadequately. Cambridge has others, nearly if not quite as good, which have not been used at all.

It is not obvious why Mr. Canning has called his volume *Philosophy of Charles Dickens* (3). It consists of a series of abstracts of some of the more important of Dickens's works, interspersed with remarks of Mr. Canning which deal more with what Dickens did not put into his books than with what he did put into them. One thing appears to be much on the writer's mind—the comparatively small number of clergymen introduced in the novels. Thus, in the chapter which he devotes to *Oliver Twist*, three pages are taken up with remarks on the fact that nothing is said concerning the action, or want of action, on the part of the clergy with regard to workhouse management. "Some writers," says Mr. Canning, "would perhaps have described a London clergyman, if a good one, as trying to interfere, but repelled and thwarted; or, if indifferent, as stupid and useless; or, if a bad man, as sanctioning the cruelty of others and conniving at keeping the public in ignorance of shameful facts." Yet, as Mr. Canning justly observes, Dickens did none of these things. Again, in *Barnaby Rudge*, the writer is deeply impressed by his ingenious discovery that "no Protestant clergymen or Roman Catholic priests are introduced, though the subject would appear" (to Mr. Canning) "to require both." The writer seems to have caught that particular form of the critical disease the chief symptom of which is the desire to complain of a thing for not being something else, and he is led away by this into making such observations as this, which appears in the chapter on *Dombey and Son*:—"Indeed the Navy is far better represented by the generous, frank Captain Cuttle" (who, by the by, was not in the navy) "than the Army by the selfish, vindictive old Major Bagstock, though both these characters are comic in their different ways, and there might have been a very amusing scene between these worthies; but they never meet." Another matter which exercises the writer is that after the opening of the *Christmas Carol*, "no further allusion is made to Marley's ghost, and what Dickens wished people to believe about the apparition seems uncertain." It would be "a pleasing thought," our author says, to believe that the spirit of Marley had, "by its successful intercession for a fellow-sinner, achieved its own salvation," and on this theme Mr. Canning goes on to write a discourse of some three or four pages. In his "Concluding Remarks" the author returns again to the discovery which has so amazed him throughout, and dwells upon "the sentiments of Mr. Crisparkle, the only good clergyman he ever described at length." On the whole, perhaps the best thing Mr. Canning can do is to found a "New Dickens Society" in humble emulation of Messrs. Fleay and Furnivall.

A third and revised edition has appeared of Captain Burton's strangely interesting account of his adventurous pilgrimage to Meccah (4).

Dr. Brandt's little volume (5) concerning Royat-les-Bains is prefaced by a few words from the pen of Dr. Burney Yeo, who spent some time last year in Auvergne, and published the result of his experiences in the *Times*. The thirty pages of Dr. Brandt's work are devoted exclusively to Royat. Dr. Brandt has a great belief in the value of the four springs which are found there, and was much pleased with the conduct of the bathing establishment. His remarks upon diet are sensible, and his book will be useful in many ways to people who think of going to Royat.

No one has a better right to speak with authority on questions of taxidermy (6) than Mr. Ward, whose skill in the art is well known to every one interested in the subject. In an introductory chapter he deals with much practical wisdom with the general equipment of a sportsman bent on big game, and gives some valuable particulars as to the places in which in various animals a well-aimed shot will be fatal. He recommends as part of the sportsman's kit a photographic camera with, of course, dry plates, and in his final paragraph observes that "the knives or other implements should be as few and simple as is consistent with meeting the real need; a tiger can be perfectly skinned by a skilful hand with a shoemaker's knife, price threepence-halfpenny." The middle of the book is occupied with directions as close and full as possible as to the skinning and preparation of various creatures; and, as we have said, no one is better qualified than Mr. Ward to give such directions. After this comes a synoptical guide to the Hunting Grounds of the World. A special feature in the arrangement of the book is found in the reservation of several blank pages at the end for memoranda.

Mr. Stewart in a short preface to a new edition of *Plutarch's Lives* (7) gives a sketch of the already existing versions, and passes on to say that "in 1844 thirteen Lives were translated by that eminent scholar, the late George Long; and it is by way of complement to these Lives that the present version was undertaken, with his consent and his approval." Those which Mr. Long translated dealt with a period in which he had a special interest, and they are therefore more fully annotated than the others. Mr. Stewart has, wisely as it seems to us, decided that it is superfluous to boil down in notes information which can readily be obtained in full in Dr. Smith's *Classical Dictionary* and *Dictionary of Antiquities*. In another matter also Mr. Stewart seems to us to have taken a sensible course. This is in the spelling of Greek proper names. It seems as absurd, he justly remarks, to make a Greek speak of Juno or Minerva as to make a Roman swear by Herakles or Ares. As both Greek and Roman divinities are constantly mentioned, he has found a way out of the difficulty by speaking of the Greek divinities by their Greek, and the Latin by their Latin, names. "In substituting a *k*," writes Mr. Stewart, "for the more usual *c*, I have followed the example of Grote, who, in his History, spells all Greek names exactly as they are written, with the exception of those with which we are so familiar in their Latin form as to render this practically impossible; as, for instance, in the case of Cyprus or Corinth, or of a name like Thucydides, where a return to the Greek *k* would be both pedantic and unmeaning." We shall look with interest to the completion of an edition which promises to be excellent.

The Society of Telegraph Engineers has published, under the conditions of the Trust Deed of a Library formed by the late Sir

(3) *Philosophy of Charles Dickens.* By the Hon. Albert S. J. Canning, Author of "Philosophy of the Waverley Novels," &c. London: Smith, Elder, & Co.

(4) *Narrative of a Pilgrimage to Meccah and Medinah.* By Richard F. Burton. Third Edition. London and Belfast: Mullan & Son.

(5) *Royat (les Bains) in Auvergne: its Mineral Waters and Climate.* By T. H. Brandt, M.D. London: H. K. Lewis.

(6) *The Sportsman's Handbook to Practical Collecting, Preserving, and Artistic Setting-up of Trophies and Specimens.* By Rowland Ward, F.Z.S. London: The Author, 166 Piccadilly, and Simpkin, Marshall, & Co.

(7) *Plutarch's Lives.* Translated from the Greek. With Notes and a Life of Plutarch. By Aubrey Stewart, M.A., and the late George Long, M.A. 4 vols. Vol. I. London: Bell & Long.

Francis Ronalds, a Catalogue (8) which he began to compile at an early date and continued to work at up to the date of his death in 1873. It contains a list not only of all the publications contained in the Ronalds Library, but also of the titles of all books, &c., on the subject of electricity and magnetism which came under the notice of the compiler. The volume also contains an interesting Life of Sir Francis Ronalds, "the Father of English Telegraphy," who invented and set up the earliest of all electric telegraphs in England at Hammersmith in 1816. The apparatus, we may note in passing, had some points in common with that which Young saw and has described in his Travels in France. It may be worth while to add that a small number of Catalogues has been printed on large paper, on one side only, for library use.

The most sumptuous volume to which the Ammergau play of 1870-1 gave rise was Mr. John P. Jackson's *Album of the Passion Play*, a portly quarto, with many woodcuts and abundant photographs of all the scenes, published in 1873. An abridgment of this, reproducing several of the woodcuts, has just been published, by way of guide-book for this year (9). The narrative of the drama is very full in this work, and the full German text of the successive songs of the chorus is given.

Another reprinted contribution to the edification of pilgrims to Ober Ammergau has appeared in the fourth edition of Dr. Molloy's *Passion Play at Ober Ammergau* (10). The speciality of this guide is an expanded programme of the acts with their accompanying tableaux. The frontispiece is a collection of photographs of the actors and *mise-en-scène* of 1870-1. The worthy divine, in a supplementary chapter referring to the notice of the play which we gave in 1871, pays us the ambiguous compliment of saying that even we forgot our wonted asperity and spoke with kindness of the performance.

The 122nd volume of the *Annual Register* (11) is issued under the supervision of a new editor, who has introduced various changes. Amongst other things, he has cut down the "remarkable occurrences" in the "Chronicle," thinking that "the appetite for the strange and marvellous has considerably abated since the time when the *Annual Register* was first started"—a position which is open to some doubt. He has extended the space devoted to literature, which is a good thing; but his review of the drama amounts to nothing more than a list of the pieces produced during the year. The section headed "Music" is yet more absurdly perfunctory. This is what we are told by the *Annual Register* about M. Massenet's *Roi de Lahore*. It is "an Eastern spectacular opera thickly sown with ballets. It obtained a slight temporary success, due chiefly to the admirable singing and acting of M. Lassalle, the baritone who filled the part of Scindia, the evil genius of the lovers; Nair (Mlle. Turolles) and Alim (Senor (*sic*)) Gayarre (*sic*)." The new editor would do better to stick to what he not unjustly calls his impartial summary of contemporary history, and to let art alone, than to publish such things as this, and as his remarks upon the year's pictures, under the heading "Art, Drama, and Music."

The third edition of "Shakspeare and the Bible" (12) contains, besides various additions, the tercentenary sermon which Bishop Wordsworth delivered at Stratford-on-Avon.

Dr. Hogg's *Indian Notes* (13) contain a mass of practical hints and information in a succinct form. His first chapter, which deals with the voyage out, is full of valuable suggestions, and is followed by one of equal merit and importance upon "Travelling in India." All that he says in the course of his work about the various "stations" is worth attention, and a peculiar and useful feature in the book is the chapter devoted to "Herbs and Simples." The work is one which cannot fail to be of real use.

Messrs. Sampson Low and Co. issue a translation, which should be welcome to all people who prefer reading English to reading French, of M. Verne's *Great Navigators of the Eighteenth Century* (14), the original of which was noticed some time ago in these columns.

A new and revised edition has appeared of Mr. Reichel's translation of Dr. Zeller's well-known work on the Stoics, Epicureans, and Sceptics (15).

A second and revised edition has appeared of Mr. Guthrie's translation of Savigny (16). Mr. Guthrie promises, when the time for a third edition arrives, to do more than he has yet found it possible to do in reviewing Savigny's influence and supplementing his work, and we trust that the time for the fulfilment of this promise may not be too far distant.

Mr. Williams's book is the first separate treatise which has appeared on the jurisdiction by Petition (17), which has become an important part of Chancery procedure. He has spared no pains in its completion and arrangement, and there can be little doubt that he is right in thinking that "it may prove of use to the Profession."

CONTENTS OF No. 1,285, JUNE 12, 1880:

CONTENTS OF No. 1,284, JUNE 5, 1880:

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

DORÉ'S GREAT WORKS, "CHRIST LEAVING the PRÆTORIUM," "CHRIST ENTERING JERUSALEM," and "The BRAZEN SERPENT," each 33 by 22 feet; with "Dream of Pilate's Wife," "Christian Martyrs," &c. at the DORÉ GALLERY, 35 New Bond Street. Daily, Ten to Six. 1s.

GROSVENOR GALLERY SUMMER EXHIBITION NOW OPEN, from Nine till Seven. Admission, 1s. Season Tickets, 5s.

EXHIBITION of RHODODENDRONS, ROYAL BOTANIC GARDENS, Regent's Park.
ANTHONY WATERER'S EXHIBITION of RHODODENDRONS in these Gardens is now on View daily.
Admission may be obtained by Orders of Fellows, or from the Exhibitor,
ANTHONY WATERER,
Knap Hill Nursery, Woking, Surrey.
The fine Standard and other Rhododendrons and Azaleas in Rotten Row, Hyde Park, are from ANTHONY WATERER.

MACLEAR TESTIMONIAL FUND.—A Committee of Masters and past and present Pupils of KING'S COLLEGE SCHOOL, London, have resolved to mark their sense of Dr. MACLEAR'S great services to the School (which he is about to leave), as its Head-Master, during the past fourteen years. Subscriptions will be gladly received by the Honorary Secretaries, N. TISARD, Esq., M.B., King's College Chambers, W.C., W. E. MILLIKEN, Esq., A-5 Cornwall Residences, Clarence Gate, Regent's Park, N.W., and J. W. GROVES, Esq., King's College, Strand, W.C.; or may be paid to the account of the Honorary Treasurers, C. J. FREAKE, Esq. and C. P. SERGOOLD, Esq. ("Maclear Testimonial Fund") with Messrs. Richard Twining & Co., 215 Strand, W.C.

CLIFTON COLLEGE.—CLASSICAL, MATHEMATICAL, and NATURAL SCIENCE SCHOLARSHIPS. NINE or more open to COMPETITION at Midsummer 1880, value from £25 to £50 a year, which may be increased from a Special Fund to £90 a year in cases of Scholars who require it. Further particulars from the HEAD-MASTER or SECRETARY, the College, Clifton, Bristol.

ENTRANCE SCHOLARSHIPS.—TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.—Four, of the value of 30 Guineas per annum, will be open to competition to all BOYS under Fourteen on the day of the Examination (June 29).—Apply to the WARDEN.

ROSSALL SCHOOL.—ENTRANCE SCHOLARSHIPS.—TWELVE to be competed for, June 29. Value, from 70 Guineas (covering School Fees) to £20. Ages, under 14½ and 15½. Candidates may be examined at Rossall or Oxford, as preferred, in Classics or Mathematics.—Apply to Rev. the HEAD-MASTER, Rossall School, Fleetwood.

MALVERN COLLEGE.
The NEXT TERM will begin on Monday, September 20.

LEAMINGTON COLLEGE.—There are Three Departments, (1) Classical, (2) Civil and Military, (3) Junior. Honours gained last year include Scholarship at Balliol, Entrances at Woolwich and Cooper's Hill.—Apply to the HEAD-MASTER.

KING ALFRED'S SCHOOL, WANTAGE, Berks.—An Ancient Foundation. Buildings spacious and modern, in a healthy district. Thorough EDUCATION for the SONS of GENTLEMEN. Fees moderate. Boys prepared for Commerce, the Professions, and the Universities.—Address, HEAD-MASTER.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

BRUCE CASTLE, TOTTENHAM.
Head-Master—Rev. W. ALMACK, M.A.
The School not only prepares BOYS for the Universities and Competitive Examinations, but offers an education of a thoroughly first-class character to those intended for professional or business life.
School buildings and grounds (20 acres) of exceptional healthiness, beauty, and convenience.
Pupils received at the Half-term.

FOLKESTONE.—MR. W. J. JEAFFRESON, M.A. Oxon., assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities, Sandhurst, Woolwich, the Civil Service, and all Competitive Examinations. A few Vacancies.

BOURNEMOUTH.—CHELTENHAM HOUSE (facing the Sea).—J. WILLIAM WILLIAMSON, M.A., Oxford, receives a few BACKWARD or DELICATE BOYS, under Fourteen, for thorough grounding. Terms moderate.

PRIVATE PUPILS, ages Fourteen to Eighteen.—Mr. JOHN C. GAWTHERNE, M.A. (Lancing and Oxford) receives a few GENTLEMEN'S SONS who are unable to go to School, and offers to deserving Boys very unusual advantages.—Address, Stifford's Bridge, near Malvern.

PUBLIC SCHOOL PREPARATION.—REGINALD S. LEA, M.A., Oxon., receives BOYS between the ages of Eight and Thirteen at date of admission; and has now made special arrangements for Boys under Ten years old. Large playing-fields.—Address, Rugby.

PUPILS prepared for the Universities, Army, &c., by Rev. W. H. ROWLANDSON (late Fellow of Corpus Christi College, Cambridge), Great Braxted Rectory, Witham, Essex.

LAUSANNE, SWITZERLAND.—Reputed for Education and Instruction.—Classical, Industrial Schools about £2 per year. Private Schools, £8 to £16. Homes for Pupils. Boarding Schools for Young Ladies and Boys from £50. English and Presbyterian Churches.—Apply to Bureau de Renseignements, la Grotte, 10, Lausanne.

REGENT'S PARK.—One or Two YOUNG LADIES can be received in a first-class finishing SCHOOL. Separate room if required. Masters of eminence attend.—Address, P. K., Keats's Library, Queen's Terrace, St. John's Wood.

VACATION or TRAVELLING TUTOR.—A UNIVERSITY GRADUATE, Roman Catholic, Assistant-Master in a Catholic College, would accept an engagement for the Summer holidays. No objection to travel.—Address GRADUATE, care of Very Rev. W. Delany, St. Stanislaus College, Tullamore, who has kindly permitted references to be made to him.

TO GENTLEMEN Engaged during the Day.—A large, airy SITTING-ROOM and BED-ROOM. Home comforts, cleanliness, and punctuality.—Address, 38 Albion Grove, Barnsbury, N.

TO BE LET, FURNISHED, for a long or short term, a Gentleman's HOUSE, in South Kensington, containing Dining, Drawing, and Breakfast Rooms, Four Bedrooms and Dressing-room, and good Domestic Offices. Rent moderate.—Address, A.B., 38 Southampton Street, Strand, W.C.

EGYPTIAN STATE DOMAINES.—The Administration of the State Domaines, composed of an English, a French, and an Egyptian Commissioner nominated by their respective Governments, is disposed to LET or to SELL LAND, in Lots of not less than 800 Acres.
The Domaines comprise 425,000 acres of land in different parts of Egypt. They are in cultivation at the present time, and the plant and cattle necessary to continue the cultivation could be acquired at a valuation.
A statement of particulars and general conditions can be had on application between the hours of Ten and Four, at the office of Mr. J. W. BARRY, 23 Delahay Street, Westminster. Further particulars can be had on application to the PRESIDENT of the Egyptian State Domaines, Cairo, to whom proposals for purchase or lease should be addressed.
FRANCIS W. ROWSELL, EDOUARD BOUTERON, ROUSTEM (Pacha), Commissioners of the State Domaines.
Cairo, May 24, 1880.

ENGLAND to AUSTRALIA in FORTY DAYS.
ORIENT LINE.
The following Royal Mail Steam Ships, belonging to the ORIENT and PACIFIC STEAM NAVIGATION COMPANIES, are despatched every FORTNIGHT for ADELAIDE (Semaphore), MELBOURNE, and SYDNEY direct, taking Passengers at through rates to all the principal ports in Australia, Tasmania, and New Zealand.

	Tons.	H.P.		Tons.	H.P.
ACONCAGUA	4,107	800	LIGURIA	4,666	750
CHIMBORAZO	3,847	550	LUSITANIA	3,825	550

THE BERLIN CONFERENCE.

THE Conference of Plenipotentiaries at Berlin will probably confine its attention to a limited number of practicable objects. In the recent conversation in the House of Lords which began with Lord CARNARVON'S speech on the condition of Armenia, Lord SALISBURY expressed a well-founded doubt of the possibility of European concert for the purpose under discussion. The Duke of ARGYLL replied with unnecessary vehemence that the authors of the Treaty of Berlin ought not to depreciate its value by throwing doubts on its efficacy. He also taunted Lord SALISBURY and Lord BEACONSFIELD with their rejection at Berlin of a Russian proposal for common action. It is to be regretted that the triumph of his party, attended by his own return to office, should not have exercised on his mind a pacifying influence. Even Mr. GLADSTONE has of late been comparatively mild and non-aggressive; but the Duke of ARGYLL cannot forgive his enemies in their defeat. Lord SALISBURY, like Lord HARTINGTON in the opium debate, was accused, because he told the simple truth, of a pessimism which is not wholly inapplicable to the worst possible condition of affairs. At Fishmongers' Hall on Saturday last Lord GRANVILLE spoke in a more cheerful tone of a different matter. It may be inferred from his appeal to the German AMBASSADOR, who was present, that the Great Powers are agreed on the objects to be discussed at the Conference; and it is believed that the English Government has accepted the project by which Janina will be included in the territory of Greece. Some preliminary understanding is indispensable to the success of any Congress or Conference, inasmuch as independent Governments can seldom allow their policy to depend on arguments used in debate or on a majority of votes. The Ambassadors, under their full powers, will confine themselves to the consideration of details, being probably bound by their instructions to take certain decisions on the questions which they will ostensibly discuss. The object of the Governments is above all things to prevent a renewal of the war in the East by urging on the Porte, and if necessary enforcing, the performance of some or all of its obligations under the Treaty of Berlin. The Turkish Ministers may with some reason contend that their rights under the treaty are as sacred as their duties, and that the SULTAN has been virtually prohibited from establishing military posts in the Balkans; but the Conference will be concerned rather with the maintenance of peace than with strict adherence to logic. Greeks and Albanians may be ready to fight for their claims; but the Turkish Government will not go to war in vindication of its right to place garrisons in the Balkan positions.

The Conference is not expected to deal with the still more difficult questions which relate to Asiatic Turkey. It was of Armenia that Lord SALISBURY spoke when he expressed the opinion which produced the Duke of ARGYLL'S acrimonious comment. Lord CARNARVON had explained the miserable and hopeless condition of the country; and Lord SALISBURY merely added that no remedy was to be found in diplomatic action at Constantinople. His own recent experience may well explain his feeling of despair. No English Minister could have been more consistently urgent in demanding the correction of abuses, and Sir HENRY LAYARD loyally executed the instructions of his chief; but, as Lord SALISBURY somewhat figuratively said, no pressure which can be applied at Constantinople finds sufficient channels of transmission to the distant provinces of Asia. Many volumes of published correspondence confirm his further statement that the only beneficent agency is that exercised by the English Consuls and their subordinates, though they have unfortunately no sufficient means of giving effect to their incessant remonstrances. Their benevolent activity has at least convinced the suffering population of the good will and sound principles of the English Government. There are few provinces in Asiatic Turkey in which the assumption of administrative supremacy by England would not be enthusiastically welcomed. Perhaps even the Mahometans would be satisfied with equality if they and the races they despise were subject to a common superior. At present there seems to be no remedy for the corruption of provincial authorities, and for their failure to protect peaceable communities from the violence of lawless freebooters. The extermination of the lately dominant race, which has been attempted and partially accomplished in Bulgaria, is rendered impossible in Armenia and Asia Minor by the numbers of the Mahometan population. The juxtaposition of hostile races, arising from remote causes, is one of the most incurable of evils. The Turks, who during the period of their unquestioned supremacy were in ordinary cases comparatively tolerant and humane, meet with neither pity nor consideration from those who have succeeded to their power. If the Armenians could be treated like the Bulgarians, they would perhaps be equally disposed to maltreat their Mahometan neighbours.

Lord SALISBURY truly attributed the prevailing misery and anarchy to the war. The results of the Russian invasion fully justify the vigilant suspicion with which successive English Governments had regarded the well-known design of conquest. Russian writers no longer conceal the long preparation for the struggle which afterward found a pretext in the Bulgarian outrages. The statesmen of whom Lord PALMERSTON during the last twenty years of his life was the principal representative entertained no special affection for the Turks, although they were free from the fanatical antipathy which has since been felt or affected by Liberals. The reason for preventing external attacks on the power of the SULTAN was that his Empire was in existence, and that it could not be overthrown or dissolved except at the cost of incalculable danger and calamity. No sympathy was at that time felt for the revolutionary intrigues which constituted Russian diplomacy in the East. On the outbreak of the Polish insurrection in 1863, Lord PALMERSTON told Baron BRUNNOW, then Russian Ambassador in England, that he regretted an enterprise which would be ruinous to the Poles themselves. He added that, as far as the movement was inconvenient to the Russians, it was a just punishment for their endeavours to produce war and rebellion in the dominions of the SULTAN; and he offered to furnish Baron BRUNNOW with a list of the muskets and other munitions of war which had lately been despatched for the purpose to Bosnia and the neighbouring provinces. The Ambassador was expressly invited to communicate the conversation to Prince GORTCHAKOFF, who might perhaps never have organized an attack upon Turkey if Lord PALMERSTON had still been in office. Two or three years ago Lord BEACONSFIELD publicly avowed his belief that the war might have been prevented by consistent and resolute opposition on the part of England. He was hampered by wavering colleagues, and by the caprice of public opinion

when it was directed by an unseasonable and mischievous agitation. If his opinion was well founded, it is a cause for regret that the reopening of the Eastern question was not at least postponed for another ten or twenty years. The Slavs of Bulgaria and of Eastern Roumelia have derived benefit from the overthrow of Turkish power. On the other hand, the Mahometans have been exposed to scandalous injustice and cruelty; and no inconsiderable portion of their community has been destroyed by famine, by disease, and, in some cases, by massacres. The condition of Armenia and of Asiatic Turkey is that which was described by Lord CARNARVON; and the central Government is more incapable, more completely demoralized, and more hostile to European influence than at any former time.

The alternative policy which has since been expounded by Mr. GLADSTONE, though it had no supporters at the time, would have consisted of a joint intervention for the same objects with those which were actually attained by the war. According to this hypothetical and retrospective project, the SULTAN was to have been compelled by the joint action of the European Powers to concede to his subjects the practical independence which is known by the modern name of autonomy. One of two results would have immediately followed. Either the SULTAN would have made ostensible concessions with the intention of recurring on the first opportunity to former practice, or forcible resistance would have been offered to the demand. The Turkish armies, which, in spite of treachery and imbecility in high places, offered a stubborn resistance to Russia in 1876, might possibly have been a match for the forces of a divided and half-hearted coalition. The English Government, whatever might be its political character, would have been exposed to overwhelming indignation if it had aided in a Russian conquest of Turkey. The establishment of autonomy would have been effected, if at all, mainly by Russian troops, and the consequences might not have been widely different from the disastrous results of a single-handed invasion. The most tolerable condition of affairs is probably to be found in Bosnia, under Austrian rule. It is true that the Austrian title to the province would not bear strict examination, and that the commencement of the Eastern troubles was the Bosnian insurrection, which was contrived and fostered by Austrian agents; but the administration of the province is believed to be impartial and equitable; and, so far as Austrian authority extends, Mahometans and Christians are compelled to abstain from reciprocal slaughter and plunder. The Austrian Government may afford to bear the charge that the rents of the Bosnian landlords still continue to be paid, although their tenants are professed Christians. Elsewhere autonomy means the despotic power of the stronger party.

THE IRISH RELIEF BILL.

MR. FORSTER had no choice on Thursday but to withdraw the clause which he had proposed to add to the Irish Relief Bill. We wait to learn the reasons by which the Government defend a proposal at once so novel and so serious. Mr. FORSTER is not given to revolutionary expedients, and when one of the most Conservative members of a Liberal Government suddenly gives notice of what is in appearance a most revolutionary expedient, he has no doubt a claim to be heard in suspense of judgment. But it will be doing him no disservice to point out that the Government will have to establish a very strong case indeed before even the introduction of such a measure can be held to be justifiable. The Bill which is to take the place of the withdrawn clause will be much more than a Bill establishing fixity of tenure. Fixity of tenure has hitherto been supposed to be an unwarrantable interference with the rights of property, because it would deprive an Irish landlord of the power of asking what rent he chooses for his farms. But the Government Bill proposes to deprive an Irish landlord in certain districts, and for a certain time, of the power of asking any rent whatever. At all events, he will get nothing by asking. Until a date to be fixed in the Bill a landlord in the distressed districts will be fined if he evicts a tenant for non-payment of rent. The fine will be called "compensation for disturbance;" but it will be a fine all the same. Looking at the Bill in the worst light, it is a confiscation of the landlord's property for the benefit of the tenant. Looking at it in the best light, it is an arbitrary taxation of the landlord's person for the benefit of the tenant. It is to be presumed that the line of defence adopted by the Government will be that, in certain districts of Ireland, the peasants are all but starving, and that, if the landlord stands on his rights and insists on getting either the rent or the farm, they must be deprived of their last chance of hanging on till better times, and be thrown upon the community for support. In order to avoid this, Parliament is to be asked to restrain the landlord from offering his tenants this alternative. He has lent his farm to a man in consideration of getting a certain payment in return, and he is now not to grumble if he gets neither payment nor farm. In what does this differ from a proposal to throw the maintenance of distressed Irish tenants on the landlords instead of on the rates? An owner of land will under this Bill be rated twice over—once as a member of the community bound to provide necessary relief for all destitute persons whatever, and once as a landlord bound to relieve his own tenants to the extent of the rent they have undertaken to pay him. Throughout the distressed districts, and for the time specified in the Bill, this impost will be universal. It is not to be supposed that a tenant protected by law against eviction will either pay rent or give up his farm. He will accept the Bill as a partial and temporary recognition of the rights of Irish tenants to hold their farms for ever subject to the payment of rent in good seasons and when it is not otherwise inconvenient, and he will esteem himself lucky to live in the part of the country in which this concession, so long demanded and so long withheld, has been first made. It is true that his claim to compensation in case of eviction will be subject to his acceptance of "just and "reasonable terms as to rent, arrears of rent, and other-"wise." But when, *ex hypothesi*, there is no rent to be had, what is the meaning of just and reasonable terms as to rent? The only terms which it will be of any use to the landlord to offer will be to go without it. There is no getting blood out of a stone, and consequently the landlord's only resource is to get rid of the stone. What the Government now propose to do is to compel him to keep the stone, subject to such "just and reasonable terms" as to getting blood out of it as a court of law shall prescribe.

When this question had for the moment been moved out of the way the Relief Bill was read a second time, though not till after a long debate. The main objection taken to the Bill is the alleged impropriety of throwing the cost of relief on the Irish Church surplus. The Government have adopted the policy of their predecessors in this respect, except that they propose to double the sum which may thus be disposed of. The Irish Church Commissioners are to be ordered to advance to the Commissioners of Public Works a million and a half instead of three-quarters of a million, and the powers of the Commissioners of Public Works with regard to making loans are to be extended. Mr. PARNELL began his speech against the second reading of the Bill with the usual plea that no measures of relief will be effectual which do not include the establishment of an Irish Parliament to manage Irish affairs. It does not seem to have occurred to him that, if such a Parliament existed, among the affairs with the management of which it would be entrusted would be the relief of Irish distress. As even Mr. PARNELL has not, we believe, proposed that the Irish Parliament should have the power of voting English and Scotch money, the power of relieving Irish distress out of Imperial funds would thus fall to the ground. The only plea on which it is possible to base the demand that the loans which the Bill proposes to make from the Irish Church surplus shall be made from the Imperial exchequer—which is Mr. PARNELL's contention—is the identity of England and Ireland. If, whatever they may be in name, they are in fact one country, the proposal is arguable. If they are not one country, the exchequer out of which the loans must come—provided that they do not come out of the Irish Church surplus—must be the Irish, not the Imperial, exchequer. It may be suspected that, in proportion as this necessity becomes visible to Mr. PARNELL, his objection to the proposed use of the Irish Church surplus will disappear. At the same time we agree with Mr. SHAW that any appropriation of the Irish Church surplus which would prevent its application to the permanent benefit of the country would be a matter for regret. The relief of the

[illegible] [illegible] on a bad harvest is hardly a proper [illegible] on which to spend a windfall which can never be [illegible]. What would there be to prevent the recurrence [illegible] similar period of distress when there was no Irish Church surplus out of which to meet it? Bad harvests do [illegible] only succeed the disestablishment of Churches. It would [illegible] wiser to adopt some plan of relief to which resort could again [illegible] had when a similar necessity arose. If it was thought desirable to apply the surplus to the relief of distress, it might be capitalised, and only the interest put to this use. In this way the means of relief would be the same in one period of distress as in another. The force of this objection, however, is greatly weakened by the fact that the Irish Church Commissioners are not directed to give money, but only to lend it. Some loss no doubt will accrue upon the transaction; but the principal will in the end be replaced, and be available either for similar loans in future years or for appropriation to some more permanent national purpose.

Mr. FORSTER defended the Bill mainly on the ground that it is necessary to fulfil the contracts already entered into under the Relief Bill of last Session, and that the money to do this is not forthcoming. The late Parliament virtually gave Irish landlords a promise that, if they could find security, they might borrow money up to the 31st of next month at 1 per cent.; and it provided 750,000*l.* out of which to make this promise good. The new Parliament has succeeded to this obligation, and the Government, on coming to consider how it is to be fulfilled, discover that they are pledged considerably beyond the 750,000*l.* Thereupon there is nothing to be done but to provide more money, and this is really the sole object of the present Relief Bill. The Government do not hold themselves responsible for the wisdom of the contracts entered into by their predecessors, but they do hold themselves responsible for the performance of them. Mr. FORSTER himself seems disposed to trust to outdoor relief rather than to these loans for meeting the distress; but he thinks that the loans to landlords have done good, though not perhaps the most good that might have been done. The most ominous part of his speech was the reference at the end to the possibility of another bad harvest.

GREECE AT GUILDHALL.

THE King of the HELLENES has been received in solemn state by the City of London. The presence of the PRINCE and PRINCESS OF WALES lent lustre, and that of Mr. GLADSTONE importance, to the occasion. Everything possible was said and done to mark the wish of the Corporation to discharge adequately its duty on what the LORD MAYOR termed an occasion of "knitting nations "together and uniting peoples." The ancient Greeks were praised, the modern Greeks were praised, and the English in return were thanked. The address presented by the RECORDER informed the KING that the LORD MAYOR and Aldermen have watched with much interest the progress of the Kingdom of the Hellenes under the benign sway of HIS MAJESTY, and the extraordinary development of commercial enterprise with foreign States, and particularly with Great Britain, since Greece was liberated and placed under a free constitutional rule. The KING replied that he felt gratified to hear that the LORD MAYOR and Aldermen have remarked and appreciated the truly remarkable progress achieved by his people since their liberation. Lunch followed; and the LORD MAYOR, inspired by the occasion and by the presence of such illustrious guests, broke into a strain of poetic rapture. A quotation supplied him with the sentiment that the heroes of Greece command in the mountains of their native land a mightier monument than the nameless Pyramids in which Kings lie buried. "I wish," said the LORD MAYOR, "the "prosperity of your kingdom may be as fully established as "the mountains referred to in those lines, and your peace as "undisturbed as the broad seas they overshadow." It is not often that a wandering monarch has so fine a sentiment offered him, and the King of the HELLENES could certainly not have hoped to have it offered him at home, where his rhapsodists must be too familiar with the appearance of the Ægean in a Northerly gale. The KING modestly replied that he took these flowery compliments as addressed, not so much to himself, as to the cause of freedom which he represented in his particular part of Europe. He would have liked, he said, to enter into some details as to the astonishing progress which Greece is making; but he feared that his knowledge of the English language was not adequate, and he had therefore to confine himself to general remarks. It is unfortunate that the KING'S English, like the health of Prince BISMARCK, should be of a nature to give way exactly at the moment when something specially interesting is expected. We would not give up the LORD MAYOR'S mountains and undisturbed seas, but we would willingly give up everything else that was said on this occasion in order to have had a few facts from so high an authority as to this astonishing progress of Greece and the Greeks. Mr. GLADSTONE closed the proceedings by a long speech, in which he comforted the KING by assuring him that the study of ancient Greek is pursued in England as vigorously as ever, and that the cause of Greece is equally dear to Englishmen of every party. The KING has timed his visit well, for if he had come only a very little sooner he might have heard the same orator proclaim that sympathy with Greece was the monopoly of Liberals. In conclusion, Mr. GLADSTONE adverted to what, in the language of the ancient Greeks, might be termed the divine good chance that had befallen the Corporation, and had guided it to fix the reception of the KING for the very day when the Berlin Conference was to begin its sittings and mark out the border-line of the territory by which Greece is to be enlarged.

From poetry we must come to prose, and endeavour to supply from the Consular Reports presented to Parliament some of those facts which the KING'S imperfect English prevented him from offering to the English public. King GEORGE at the age of eighteen accepted the crown of Greece, in 1863, so that he has now reigned seventeen years, and has passed from boyhood to manhood in his strange home. His time has been largely occupied by the formation and resignation of Ministries, the average duration of his Ministries being less than a year. His kingdom enjoys a revenue of a little over 1,600,000*l.*, and indulges in an expenditure of a little over 2,100,000*l.* The deficit in the last year for which a return has been published is larger than that in ordinary years, owing to the efforts Greece has recently been making to augment its military strength. But there always is a deficit in Greek finance, and we find this habitual deficit attributed in the *Statesman's Year-Book* to the excessive number of Government officials, which is said to amount to one-twelfth of the total population. As the total population is calculated at somewhat over 1,600,000, there would thus be 140,000 officials, a number which we have no means of disputing, but which we should have thought simply incredible. The KING started well, for not only did he bring with him Corfu as a present from England, but he had a loan granted him of upwards of two millions sterling, guaranteed by England, France, and Russia. Each Power guarantees its own third of the loan, and by a subsequent arrangement what Greece had to pay for each third of the loan was reduced to a sum of 12,000*l.* a year; and out of our fraction we very kindly allow the KING by way of pocket money 4,000*l.* a year. So that the KING, while enjoying the impassioned oratory of the LORD MAYOR, must have had it in his mind that he was getting something out of England much more substantial than fruit, flowers, and poetry. He has got a little navy, comprising two ironclads, and manned by 384 sailors, and it may be hoped that the crews are kept in good order, as they are commanded by no fewer than 269 officers. He has also got an army, the normal strength of which is 14,000 men; and here again the same attentive provision for discipline is observable, for 3,000 officers command 11,000 privates. The trade of Greece is almost entirely with England, and appears to be curiously stationary. Ten years ago the exports from Greece to Great Britain amounted to 1,526,000*l.*; now they have risen to 1,763,000*l.* These exports to Great Britain consist almost entirely of currants, as Greece has nothing else to send us. The imports of British produce into Greece, consisting chiefly of cotton goods, ten years ago reached 974,000*l.*, and now reach 982,000*l.* In short, Greece, having nothing else to send, sends us currants, and takes back a trifling amount of cotton goods, and both in regard to its supply and its demand stands to us almost exactly as it stood ten years ago.

Figures like these will explain the regret which all persons acquainted with Consular statistics must have felt at the sudden collapse of the KING'S English just as he was going to justify in detail the statement of the

address that there has been an extraordinary development of Greek commercial enterprise with foreign States, and particularly with Great Britain. The LORD MAYOR and Aldermen assured the KING that they have a keen eye for currants, and have watched with unrelaxing vigilance the arrivals of cargoes of this useful fruit. Probably, therefore, the statement that there has been an astonishing development of Greek commercial enterprise may warrant us in assuming that more currants have come to hand than is generally supposed; but the increase appears to have escaped the less penetrating watchfulness of our Consular authorities. Greece is mainly an agricultural country; but, far from having agricultural produce to export, it has to make up by importations from South Russia the corn which it cannot grow in sufficient quantities for itself; and the general condition of Greek agriculture may be to some extent inferred from the fact that the kingdom is inhabited by about two million goats, who browse about at will and destroy whatever tempts them. The two most favourable signs that prosaic inquirers can find in the present condition of Greece are the rapid increase of population and the attention given to public instruction. In nine years from 1870 the increase of population was 221,000, or about 14 per cent. It is extremely unfair to compare Greece with other small States which are thriving on the basis of an ancient civilization. If a just comparison is to be made, Portugal may be taken as the highest class of State with which Greece can be compared. From that excellent repertory of information, Mr. MARTIN'S *Year-Book*, we learn that in six years the population of Portugal, which is about four millions, only increased by 60,000, or 1½ per cent., so that in this respect Greece may be fairly said to be shooting far ahead of Portugal. Education has undoubtedly also made some progress in Greece. Although compulsory education has been nominally established for nearly half a century, the education of the poor still remains in a very backward state. So lately as 1870 it was found that only seven per cent. of the grown-up women could read or write. But a greater success appears to have attended the efforts to give a higher education to those who can take advantage of it. There are schools where ancient Greek is taught, there are gymnasia for the more advanced, and there is a University which is understood to turn out proportionately more advocates and doctors with nothing to do than any similar institution in Europe. The truth is that Greece is still very new, very poor, and very backward. It still must point to a possible future, and not to an ascertained present. Englishmen of all parties will join with Mr. GLADSTONE in hoping that the future of Greece may be as bright as its most ardent friends anticipate. But if we are to look at Greece, not as it may be, but as it is, we must take off a heavy discount before we can accept the flowery statements of the Guildhall festivities.

MR. O'DONNELL'S QUESTION.

THE confused squabble in the House of Commons on Monday night was highly unsatisfactory. There is but one opinion as to Mr. O'DONNELL'S taste, and there are not many opinions about Mr. GLADSTONE'S tact and prudence. Sir W. HARCOURT had a few days before created general irritation by his hares-and-rabbits peech; but, according to a writer of extreme democratic opinions, he had selected the best mode of advocating a Bill which, according to the same authority, can only be carried by terror. He would have been better advised if he had followed a different course of proceeding in the later discussion. It was quite useless to try to frighten Sir STAFFORD NORTHCOTE by accusing him of giving powerful support to Mr. O'DONNELL. Lord HARTINGTON afterwards made the best of an awkward blunder by contending that new remedies were necessary for unprecedented breaches of order. In a case where there was no appeal to his party loyalty, Lord HARTINGTON would not seriously maintain that extemporaneous rules ought to be invented and applied, especially by so impetuous a leader of the House as Mr. GLADSTONE. The SPEAKER ruled that no such course had been followed for two hundred years; but he somewhat compromised his authority when he added that during that period no similar provocation had occurred. The SPEAKER has certainly not read all the debates since the Revolution of 1688, which contain some specimens of sufficiently extravagant language. Not a hundred years have elapsed since BURKE hurled down his celebrated dagger on the floor of the House of Commons. Resuscitated precedents drawn from distant times are sometimes the grossest innovations. Lord PALMERSTON and Lord CRANWORTH fortunately failed in their attempt to introduce life peers into the House of Lords, although they were able to quote some cases of the same kind in the early days of the TUDORS. Mr. GLADSTONE was scarcely more felicitous in his reference to his own contrivance for overcoming the resistance of the Peers to the abolition of the paper duty. Constitutional statesmen ought to abide by the letter and spirit of modern or contemporary legislation.

The impropriety of Mr. O'DONNELL'S question and speech was curiously illustrated by the unanimous disapproval of his own party; but perhaps his friends objected rather to the application of his censure than to the gross indecency of a public attack on a foreign Ambassador. It is Mr. O'DONNELL'S pleasure to be a Roman Catholic first, and a democrat afterwards. To this extent the Irish priests, though they have lost much of their electoral influence, are deemed to be still worth conciliation. The majority of the party are rather democratic than Ultramontane, and they can pardon M. CHALLEMEL-LACOUR'S hostility to the Church in consideration of his avowed and strong Republican opinions. They were perhaps as little careful as Mr. O'DONNELL to inquire whether he had really ordered a body of soldiers to be shot in cold blood; and they may have shared the common belief that he is extremely unlikely to have sacked a convent. Some vigorous episodes in his administration of Lyons would suit the popular Irish taste. It was well that Sir CHARLES DILKE had the means of vindicating the character of the French AMBASSADOR from Mr. O'DONNELL'S imputations. Nothing could be more characteristic than Mr. O'DONNELL'S determination to persevere by the aid of a fiction which has often been used for similar purposes. The announcement by a member who is called to order that he intends to conclude with a motion is familiar to all readers of debates. As Sir STAFFORD NORTHCOTE reminded Mr. GLADSTONE, Mr. BRIGHT had employed the same pretext for making an elaborate speech only a few months ago. The SPEAKER deserves credit for his consistent efforts to suppress a practice which is obviously inconvenient. He has not fully succeeded, and Sir STAFFORD NORTHCOTE attributes his failure to the indisposition of the late leaders of Opposition to support his own remonstrances against the abuse.

The interest of the question whether a formal motion would justify an otherwise irregular speech was entirely superseded by Mr. GLADSTONE'S startling motion that Mr. O'DONNELL be not heard. He rose in the first instance to order, though he afterwards denied that he had called Mr. O'DONNELL to order. It is hardly necessary to say that a call to order is necessarily addressed to some offender. Mr. GLADSTONE'S motion was a much more striking violation of order as the term has been commonly understood. The great majority of the House was wholly free from any desire to hear Mr. O'DONNELL, but it was scarcely prepared to silence him by a method which might suppress all freedom of debate. The consequences which might follow from the establishment of such a precedent were at once generally perceived; and among others Sir STAFFORD NORTHCOTE exposed in temperate language the objections to the proposed novelty, when Sir W. HARCOURT discerned in his argument a complicity with the chief offender. The Irish members who had declined to take part in the original quarrel at once burst into full cry against a presumptuous and despotic Minister. It was easy to assume that Mr. GLADSTONE claimed for himself a right to silence any opponent by inducing his majority to vote that a hostile speech should not be heard. To mere temperate critics it was obvious that any power which Mr. GLADSTONE claimed for himself must, if it were recognised, be shared by the humblest member of the House. It would be bad enough that a tyrannical Minister should suppress freedom of debate, but a general right of prohibition on the motion of any private member would produce intolerable anarchy. After a long and varied discussion, Mr. GLADSTONE had the good sense to withdraw his hasty motion; and he had no need to renew it when Mr. O'DONNELL attempted to repeat his offensive questions and statements. There seems to be no reason why the Standing Orders should not be amended so as to prevent speeches made on the pretext of fictitious motions. If the SPEAKER at the same time excluded from the paper argumentative questions, a certain check would be offered

to irrelevance and obstruction. His refusal to allow Mr. O'Donnell on Thursday to put a question which has in consequence not been divulged met with the unanimous approval of the House. Only a few minutes were wasted by the protest of the aggrieved member, who, finding it hopeless to create further disturbance, judiciously relieved the House of his presence. A vote that a member should not be heard might be interposed, like the veto of a Roman Tribune, in the midst of the most necessary business. One member indeed, in a spirit of humorous retaliation, reduced the proposal to absurdity by moving that Sir W. Harcourt himself should not be heard. The Irish members at least were determined that the House should have the advantage of hearing their remonstrances and protests, one of their number complacently reminding the House of the twenty-six hours' sitting in 1877 which did so much to bring Parliamentary debate into contempt.

The provisional or partial alliance between the Government and the Home Rule party seems to be already dissolved. The speeches of several Irish members on the conflict between Mr. Gladstone and Mr. O'Donnell contained threats of obstruction which will probably be carried into effect on the first opportunity. Even Mr. Forster's admission of the principle that compensation may in certain cases be given for disturbance on non-payment of rent will fail to conciliate the representatives of the Land League. It cannot be said that in the last Parliament Sir Stafford Northcote was remarkably successful in dealing with the question of obstruction, but the Standing Order which he passed, with the consent of both parties, immediately before the dissolution may possibly be effective for the purpose. Lord Palmerston or Mr. Disraeli, in their best days, might perhaps have exercised an influence over the House of Commons which has not been acquired by their successors. Mr. Gladstone has the advantage of unequalled eloquence, and he commands an irresistible majority; but he has never been distinguished by skill in the management of men, and some of his colleagues have the undesirable faculty of producing constant irritation. The prospects of a tranquil and useful Session are at present not encouraging. The Bradlaugh controversy, which may perhaps not even have approached its conclusion, has already wasted much valuable time. The annoyance and resentment which are provoked by the unjustifiable Bill for the suppression of ground game will find the fuller expression because Sir W. Harcourt has thought it expedient to offer unnecessary offence to the proposed victims of one-sided legislation. On one of the Government measures the House will perhaps be really unanimous, though the opponents of the measure will not avow their real indifference to the provisions which they may ostensibly oppose. The best argument for the reduction of the Irish borough franchise is to be found in the character of some of the members who are returned under the present system. A further degradation of the suffrage will establish theoretical symmetry, and it can scarcely make the representation much worse. It is not known whether Sir G. Campbell will press his motion for the postponement of the Bill until a more comprehensive Irish Reform Bill is introduced. The great majority of the Liberal party, and perhaps a section of the Opposition, will gladly deprive the Irish agitators of one of their favourite grievances. If the obstructive faction should unexpectedly suspend its operations during the Session, it will almost establish a claim to a kind of gratitude.

THE BRADLAUGH COMMITTEE REPORT.

We in England have a habit, some of us of congratulating ourselves upon the absence of a too rigid attention to logical consistency in matters of public importance, and some of us of deploring this absence. Both parties can find material to their purpose in the Report of the Committee on the Bradlaugh case. This Report practically upsets the conclusion arrived at by the previous Committee, with the additional eccentricity that the conclusion in question lay quite out of the scope of the actual inquiry. That Select Committees should report adversely to one another is perhaps nothing very novel or remarkable. But that a Committee which was supposed to be merely an enlarged edition of its predecessor, and which was appointed, not to reconsider the decision of that predecessor, but to consider the further issues which that decision had opened up, should find its way out of its difficulty by eluding it altogether and ignoring the very conditions of its own existence—this surely is a curious state of things. The first Committee decided before the 20th of May that persons judicially permitted in certain cases to make affirmation instead of oath in courts of justice could not be admitted to the same alternative in the House of Commons. In so deciding they gave their opinion with the strictest pertinence to the reference made to them. The reference to the present Committee included the facts and circumstances under which Mr. Bradlaugh claims to make, not the affirmation, but the oath, the law applicable to his claim, and the right and jurisdiction of the House to concede or refuse that claim. On all these points the Committee report adversely to Mr. Bradlaugh, and if their Report had stopped here there would have been nothing to be said against it. The House, being in doubt about its powers, has appointed two Committees to enlighten it on the two different parts of the case. The first Committee was to deal with the affirmation, the second with the oath; and if the Reports of both had been guided by the same attention to the terms of the reference, they would have furnished the House with all sufficient information.

It has, however, been sufficiently evident all along that the Government aimed at something more than this. Their desire—a desire by no means unnatural, if not wholly justifiable—has been to avoid the responsibility of handling a rather unsavoury business. This responsibility they would not have avoided had the second Committee been as careful not to go *ultra vires* as the first. The House, with the evidence before it that Mr. Bradlaugh could not be allowed to affirm, and ought not to be allowed to make oath, would have had either to refuse him all means of fulfilling his constituents' mandate, or to legislate afresh for his relief. In either case the Government must have taken a side—a thing which they clearly do not desire to do, and which their previous conduct in the matter has made it anything but easy for them to do. It was therefore in their interest that some back way, if possible, should be found out of the difficulty, and this back way was found by a very singular device, due, it seems, to the ingenuity of Mr. Serjeant Simon. The legitimate conclusion of the Report had been reached, the reasons of the Committee for thinking that Mr. Bradlaugh's compliance with the form of taking the oath would not be a taking of it within the meaning of the statute, being rather ingenious and quite conclusive. Mr. Bradlaugh, say the Committee, has alleged his own practice of affirming in courts of justice. Now, before so affirming, he must have satisfied the judge that an oath would not be binding on his conscience. Therefore in the parallel case the oath must be supposed to be equally not binding, and the taking of it cannot be held to be a satisfaction of the demands of the statute. At this point Sir R. Cross moved to add "That Mr. Bradlaugh cannot "take his seat unless enabled to do so by fresh legis-"lation." This was practically only a summing up, in other words, of the conclusions (separately arrived at, but mutually complementary) of the two Committees; and the addition of the words, "It does not, however, ap-"pear to your Committee to come within the scope of "their reference to make any special recommendation on "the subject," saved it from the objection to which the alternative addition of Mr. Serjeant Simon is exposed. That addition ignores the scope of the reference in a manner almost heroic, reverses the decision of the previous Committee with still greater audacity, and makes a recommendation which, whatever its convenience to the Government and some of their supporters, is of extraordinary feebleness, and at the same time undignified to the last degree. Mr. Serjeant Simon's paragraph rehearsing the circumstances of the former Committee's decision and the proportion of the votes suggests that Mr. Bradlaugh should be allowed to affirm without interference, subject to the decision of the courts of law in an action, which anybody is at liberty to bring, for the penalties incurred by a member who exercises his privileges unsworn. At this action, as at the affirmation, the House is requested to wink, despite its ancient and far from unhealthy jealousy of any meddling in its affairs by the courts of law. The paragraph was carried by a "straight" party vote, even Mr. Hopwood, whose action practically decided the opinion of the former Committee, taking the same line as his political friends.

It cannot be doubted that the adoption of this

Report will meet with strenuous opposition in the House, and there is as little doubt that this opposition will be amply justified. Indeed it would require some ingenuity to draw up a paragraph which should be wrong in more ways than Mr. Serjeant SIMON'S. In the first place, there is the objection—technically at least fatal and final—that the Committee have entirely overstepped their reference in making any such recommendation. They were not asked to tell the House what it should do generally, but what were the facts and what was the law as to certain specific points. They were not asked to discuss the division lists of the previous Committee. They were not instructed to consider the question of affirmation at all. They were not asked whether the courts of law could supply at a pinch a way out of the difficulty. They were not asked whether the House should or should not "exercise its power to prevent Mr. BRADLAUGH" from adopting this way. On all these points, therefore, the recommendation is practically not the recommendation of a Select Committee of the House of Commons, but simply the private opinion of a dozen members who happen to find themselves in a committee-room with nine other members of a different opinion. And this recommendation, technically irregular and worthless, is at least as bad in matter as it is in form. The flat contradiction of the result arrived at by the previous Committee may be said to be part of its technical, rather than of its material defects, though this also is in itself a most dangerous and mischievous precedent, made more mischievous and dangerous by the reason assigned for it. But the actual recommendation itself gives amply sufficient hold even to the least enterprising opponent. At present it must be admitted that there is no evidence before the House to show that affirmation, instead of swearing, is in any case legally possible for Mr. BRADLAUGH. The SPEAKER does not consider himself justified in saying that it is, and a Select Committee has decided that it is not. Yet the House, to whose judgment the matter was distinctly referred by the SPEAKER himself, is invited to refrain altogether from giving that judgment, and to permit a proceeding which the only authoritative decision pronounces to be inadmissible. And it is to do this in the hope that somebody or other will thereupon save it from the consequences of its inaction, and from the disagreeableness of deciding on any action at all, by having recourse to a court of law.

It is impossible to imagine the House of Commons cutting a sorrier figure than that which it is proposed that it shall assume in this matter. For, apart from the indignity and cowardice of thus shirking a decision, it must be remembered that the House, by adopting the recommendation of the Committee, will not merely be exposing Mr. BRADLAUGH to an action and a possible penalty. By conniving at his affirmation, the House will have made itself one with Mr. BRADLAUGH, and will invite the courts of law to pronounce on the legality and propriety of its own conduct. A more lame and impotent conclusion it would be impossible to imagine. Its indirect object is indeed, as we have said, obvious, and the Government ought no doubt to be grateful to Serjeant SIMON for his intentions; but it is by no means certain that the bypath he has indicated to them will not, like other bypaths, land them in a much profounder slough of difficulty than a more straightforward course would have done. There is, to begin with, the certainty of a great fight on extremely disadvantageous ground, and where a numerical victory must inevitably be attended with hopeless defeat in argument. Next there is the extraordinary and most damaging spectacle which will be presented by a collusive action, if it be collusive, or by a genuine action brought by some one who dares to do the duty which Ministry and Parliament have shirked. Lastly, there is in all probability in store for Mr. GLADSTONE and his colleagues a dilemma not less embarrassing than that from which they are trying to escape. Whether the decision of a court is for or against Mr. BRADLAUGH, it will probably be found impossible to leave the matter without an attempt at some more satisfactory settlement in the way of legislation, or else without leaving the elect of Northampton still deprived of his seat. The bypath will in that case simply have led round into the high road at about the same spot as that whence the traveller diverged. In such cases it not unfrequently happens that the traveller emerges not only with loss of time and temper, but also of cleanliness.

THE BUDGET.

THE most objectionable part of Mr. GLADSTONE'S Budget is the additional penny of Income-tax which alone renders the other provisions possible. If it is only retained for one year the burden will be borne with more or less impatience; but experience shows that every increase in the rate has a tendency to survive the occasion of its immediate origin. No Finance Minister has altered the percentage of the tax on income so often or so largely as Mr. GLADSTONE. In 1860 he made an additional penny in the pound the condition of the repeal of the paper duty which was effected in the following year. It is not surprising that he should refer with complacency to an experiment which has proved eminently successful. It is now difficult to recall the time when the manufacture of paper, of glass, and of bricks was restrained and embarrassed by the constant supervision of the Excise. Mr. GLADSTONE had good reason for his lively description of the panic as to rags which, before the introduction of many alternative materials of paper-making, seemed not unreasonable. On the present occasion he will have no need to provoke an irritating conflict with the House of Lords, or to strain the Constitution by the device of an indivisible Budget, which has since been adopted, in an exaggerated form, by colonial imitators. In the late O'DONNELL debate Mr. GLADSTONE boasted that his experiment of 1861 had no precedent within more than two hundred years. He failed to perceive that he uttered the strongest censure on an innovation in the form of a revival of obsolete practice. The excuse for such operations as those of 1860 and 1880 is that, in removing, by aid of the Income-tax, duties on commodities, a Chancellor of the Exchequer may create an elastic source of wealth, if not of revenue. The whole community has probably been enriched by the abolition of the paper duty to a much larger amount than the sum contributed for the purpose in the form of Income-tax. It is nevertheless desirable to remember that in such cases one class is relieved at the expense of another; and financiers ought always to bear in mind the special inequality which is caused by every additional penny in the pound. The Income-tax is approximately just when it is levied for a long period at the same rate; for ten terms of an income worth three years' purchase, earned perhaps by half a dozen successive recipients, are equal in value to an annuity for thirty years. An Income-tax for a single year is levied on earnings and profits at the same rate as on property which may be thirtyfold greater in value. Another class of taxpayers will in the present instance be subject to oppression, if not to inequality. Landowners are now suffering under an extraordinary depression which is not unlikely to be more or less permanent. Their share of the extra penny in the pound will in many cases be levied on imaginary receipts which might rather be described as losses. The ease with which the official operator gives another turn to the fiscal screw sometimes blinds him to the pain which he inflicts on the victim.

In one respect the payers of Income-tax may possibly receive eventual compensation for their almost exclusive share in the latest addition to the public burdens. The beer duty, like the Income-tax, will furnish future Governments with another variable or elastic revenue in times of difficulty. The malt duty could not have been temporarily increased without risk of active opposition from the farmers, who are still a powerful body. A percentage on beer will in the first instance fall on a few thousands of brewers, who will perhaps not be able to pass on the burden to the consumers. A candidate at a late election was said to propound, as his central principle and chief claim to the confidence of a constituency, the simple maxim of beer at a penny a quart. Though his aspirations will not be realized, a custom almost as binding as law has fixed the retail price of beer. The publicans and the brewers, if they find that their profits are declining, can only secure themselves against loss, not by increase of price, but by deterioration of quality. For these reasons it will be in the power of future Chancellors of the Exchequer to meet sudden demands by additional taxation of beer in place of income; or probably to effect both operations at the same time. A shilling charge on thirty-six gallons will correspond to less than a twelfth of a penny on a pint of beer. The manufacturer and the vendor will be compelled to divide the loss; and at present popular feeling is hostile to publicans,

and indifferent to the complaints of brewers, especially to those of the richer part of their body. Mr. GLADSTONE will not seriously justify the double burden which he imposes on publicans as a retribution for their hostility during the late election. Vindictive finance would be only worthy of a Jacobin, though the Liberal party will not be unwilling to propagate a superstitious belief in the bad luck which attends opposition to Mr. GLADSTONE. The Hares and Rabbits Bill inflicts profound annoyance on the landlords whom Mr. GLADSTONE denounced as his enemies, and the heavy tax on public-houses will be at least equally unpalatable to the licensed victuallers; but the increased charge for licences will be defended on less immoral grounds. Late changes in the law and increased strictness of administration have produced their intended effect in discouraging the establishment of new public-houses, though the old licences have not been withdrawn. The trade, therefore, enjoys a more and more valuable monopoly, which is by an odd coincidence the immediate result of the temperance agitation. It is difficult or impossible to judge whether the proposed licence duty is moderate or excessive in amount; but a privilege which insures large profits to the holder is, in itself, a legitimate subject of taxation. A portion of the burden, though not the whole, will fall on the owners of public-houses, who are rarely the same with the occupiers. In towns and in many country districts, the brewers, as the principal holders of public-house property, will be expected to divide the burden with their tenants.

The brewers will also complain of the disagreeable intervention of the revenue officers with their processes of manufacture and their conduct of business. There is undoubtedly a strong objection to Excise duties, though they are perhaps somewhat less popularly odious than when JOHNSON inserted his celebrated definition in his Dictionary. The only excuse for an excise on beer is that money must be had; and that, as compared with beer, malt approaches more nearly to the character of a raw material. The maltsters will therefore gain an advantage somewhat greater than the grievance which is inflicted on brewers; and when the same person conducts both trades his gains will probably exceed his loss. Brewers will perhaps be supplied with better and cheaper malt to compensate in part for the duties to which they are liable. To the balance of hardship which remains they must reconcile themselves as to a permanent evil. The tax, once imposed, will not be repealed in the lifetime of the present generation, unless a future financier more inventive than Mr. GLADSTONE himself should substitute some other subject-matter for beer, as beer now takes the place of malt. Mr. GLADSTONE's predecessors properly refused to reduce the malt duty, because it was not worth while to interfere with the trade except for the sake of obtaining a large revenue; and they shrank from abolition because they were not so clever or so bold as Mr. GLADSTONE. Few persons now alive recollect the old beer duty which was abolished amidst universal satisfaction more than fifty years ago. The technical difficulty of gauging the quality of beer for the purpose of proportionate taxation will be imperfectly surmounted. If all beer were of the same strength and purity, a tax on the sale of the commodity would be less vexatious than an Excise duty, and it would be equally productive.

The confidence which is felt in Mr. GLADSTONE's financial skill and fortune accounts for the general readiness to overlook the circumstance that the Budget is at present provisional. The proposed reduction of the Customs duties on wine is professedly offered as the price of the concession of a reasonable treaty of commerce with France. The fallacy involved in the transaction is generally understood in England; but practical necessities are properly preferred to sound theories. The eminent economist who was lately French Ambassador probably represented to Mr. GLADSTONE and Lord GRANVILLE that it would be impossible to convince the Chamber of the expediency of comparatively unrestricted trade, except by offering a direct and tangible boon to some section of French producers. The reduction of the wine duties had probably been arranged with M. LÉON SAY, who had not left London at the date of Mr. GLADSTONE's speech. It had been taken for granted that the AMBASSADOR had the authority of his Government to offer a treaty not more onerous to English commerce than that which is about to expire; but M. DE FREYCINET has since assured the Chamber that his Government has not entered into any agreement. Mr. GLADSTONE's unwise proposal of taxing bottled wines at a higher rate will divide even the wine-growers, and unite in hostility to a treaty all who are interested in the manufacture or sale of bottles and corks. The chances, on the whole, are against the fulfilment of the conditions on which the reduction of the wine duty depends. It remains to be seen whether the Chamber will ratify any engagement which may have been assumed by the Ministers. M. POUYER QUERTIER and M. WADDINGTON of Rouen will not relax in their endeavours to retain a monopoly in their own manufactures for the sake of creating an additional demand for the produce of the Southern vineyards. The wine-growers are probably not so well organized as the cotton-spinners; but the proposal made by the English Government will perhaps, with some additional concession, influence the popular sentiment. The reduction of the duty, amounting to three-halfpence on a pint of light claret, will not greatly matter to the English consumer. It is not stated whether the rest of the Budget is to be enacted if the French Government should fail to make the concessions which were to compensate for the reduction of the wine duty.

THE FRENCH SENATE AND THE TREATY OF COMMERCE.

THE delicacy of the negotiations upon the success of which the renewal of the Treaty of Commerce depends is clearly shown by some recent proceedings in the French Senate. On Monday M. DE FREYCINET waited on the Tariff Committee to give explanations of the alleged signature by M. LÉON SAY and Lord GRANVILLE of certain bases on which the negotiations are to proceed. The Senate is evidently not at all disposed to have a treaty concluded over the head of the Legislature, and upon this point it will probably find the Chamber of Deputies in complete accord with it. It is unfortunate perhaps that the necessities of English finance should have driven Mr. GLADSTONE to make so full an exposition of the aims of the English Government as he made in his Budget speech. The reduction of the wine duties is not a measure which an English Chancellor of the Exchequer would have been likely to propose on its merits. So far as the revision of the imposts on alcohol are concerned, the abolition of the Malt-tax would have given him quite occupation enough for one Session. Consequently Mr. GLADSTONE could not touch the wine duties without giving a full statement of the reason which induced him to take them in hand, and the reason which induced him to take them in hand was simply that, unless he was authorized to do so, he would have nothing to offer to the French negotiators in return for the concessions he asks from them. Accordingly the whole story had to be told, and, when told, it was hardly of a kind to satisfy a Budget Committee strongly affected by Protectionist views. M. DE FREYCINET was able to reassure the Committee as to the extent to which the French Government are already pledged to the conclusion of the treaty. The Government, he said, had made no agreement on the subject. The letters which had been exchanged between M. SAY and Lord GRANVILLE had been of the most general kind. M. SAY had offered to open negotiations with Great Britain for the renewal of the treaty of 1860 on four bases—the reduction of the English wine duties, the exclusion from the treaty of any reference to cattle and agricultural produce entering France, the check of Customs frauds, and the improvement of the *status quo* in the sense of the development of the commercial relations between the two countries. By this letter M. DE FREYCINET admitted that the French Government were bound. What the Senate is anxious to know, however, is not so much whether the French Government are bound by M. SAY's letter as whether they are bound by the interpretation which Lord GRANVILLE places upon M. SAY's letter. Lord GRANVILLE, in his reply, accepts the four points enumerated by M. LÉON SAY as offering a satisfactory basis of negotiations, but he makes the fourth point a little more definite. The improvement in the *status quo*, he says, must necessarily mean a reduction of the duties on the chief products of English industry. The commercial relations between the two countries can be developed in this way and in no other, though this reduction need not extend to all English products. It was consoling to the Committee to learn from M. DE FREYCINET that nothing in Lord GRANVILLE's letter, as such, committed the French Government; but when he

had left them they could not disguise their uneasiness lest the French Government should find themselves bound, not by Lord GRANVILLE'S letter, but by the hard and unpleasant fact underlying Lord GRANVILLE'S letter. It is true that the words "developing the commercial relations between "the two countries" do not mean a reduction of the tariff simply because this is the sense in which Lord GRANVILLE takes them. But they may mean a reduction of the tariff, not because it is the sense in which Lord GRANVILLE takes them, but because it is the only sense which can possibly be put upon them. If the Treaty of Commerce is not renewed, the duties on English goods imported into France will be regulated by the new general tariff. Unless, therefore, the proposed development of the commercial relations between the two countries is to admit English goods into France on easier terms than those prescribed by the general tariff, it will not be a development at all. It will either leave the commercial relations between the two countries where the general tariff leaves them, or it will alter them for the worse.

The Committee finally determined to put a question in the Senate the next day. The Chairman discussed with the Committee what sort of speech he should make, and on Tuesday he asked M. DE FREYCINET whether he would await the passing of the general tariff by the Senate before concluding any new commercial treaties, what was the bearing of the correspondence between M. SAY and Lord GRANVILLE, and whether as a matter of fact the Government had interpreted that correspondence in the sense in which Lord GRANVILLE had interpreted it. Questions of this kind, asked by a protectionist Committee, are not easily answered by a Government which is more enlightened in such matters than its examiners. M. DE FREYCINET was able to rest his refusal to give any pledge about the date at which a treaty with England should be concluded on the constitutional right of the Executive to conclude treaties, subject to their acceptance or rejection by the Legislature. As regards the correspondence between M. SAY and Lord GRANVILLE, the Minister said that the French Government were bound by the words of their own representative, and by no others, and that Lord GRANVILLE had a right to form his own opinion of M. SAY'S meaning. The majority of the Senators present seem to have been reassured by the recollection that the Treaty of Commerce would in the end have to be submitted to the Chambers, and consequently that, if M. CHALLEMEL-LACOUR signs something which he ought not to sign, it will go for nothing until the Senate and the Chamber have ratified his handiwork. The protectionist minority remained, of course, irreconcilable; M. POUYER-QUERTIER in particular regretting that the Government stood committed even to M. SAY'S letter. M. POUYER-QUERTIER is a consistent protectionist; and, quite naturally, he does not wish the commercial relations of France and England to be developed. In his opinion, every country should, as far as possible, be self-sufficing and self-contained. He does not want to see English goods allowed to come into France with greater freedom than at present. On the contrary, he wishes them kept out altogether. It is of far more moment, in his estimation, that France should manufacture cottons than that she should export wines, and he knows very well that the English Government will not reduce the duty on wines unless the French Government are ready to reduce their duties either on imports generally or on some selected imports. Which of these last two courses is taken M. POUYER-QUERTIER does not much care. However small the selection may be, cotton goods are sure to find a place in it, and it is cotton goods that M. POUYER-QUERTIER is specially anxious to keep at a distance. If they are to be let in, it will be hardly worth while to keep anything else out. Nothing came of the discussion in the Senate, but the drift of it certainly suggests that the ratification of the Treaty of Commerce must not be counted on as certain. As the English Government have but one inducement to offer to the French Government, so the French Government have but one inducement to offer to their own people. Every industry which sees the protective duty imposed for its benefit by the new general tariff will be opposed to the conclusion of any treaty at all; and the only interest that can be expected to favour a new treaty will be the one interest which will be a loser if a new treaty is not concluded. The growers of wine, and especially the growers of cheap wine, will be eager to have a larger market thrown open to them in this country, and unless some concession is made to English demands in regard to imports, this larger market must remain closed. It is a curious economical fact that the interests of some of the largest and poorest classes of English artisans should in this instance be closely associated with those of a body of producers whom they only know as ministering to English luxury.

ELECTION PETITIONS.

THE results of the election petitions hitherto decided are without any political significance. Three Liberals have been unseated for English boroughs—at Gravesend, Gloucester, and Evesham; and two Conservatives have been unseated at Canterbury. Petitions presented at Cheltenham and at Colchester against Liberals have failed, and an attack against a Conservative seat at Harwich has been equally unsuccessful. At Gloucester Mr. ROBINSON, who was returned at the head of the poll as a Liberal, did not venture to oppose the petition against his return; and although no evidence was offered against the return of the other Liberal member, Mr. MONK, the Judges have thought it necessary to call the attention of the House to the prevalence of corrupt practices in this important borough. If the evidence given was to be trusted, corrupt practices are of long standing at Gloucester, and have not been confined to one side of politics. No candidate has been found guilty of personal bribery, and the advantage of Judges presiding at these inquiries is perhaps as much illustrated by the number of petitions that have been withdrawn because it was ascertained that they would not bear the test of judicial investigation as by the legal quality of the decisions given. It may be doubted whether any new points of law have been decided; but in the case of Gravesend the inquiry was so minute and elaborate, and the judgment followed the details of the charges so closely, that those who are engaged in the study of election law cannot omit to notice with attention what took place and what was decided in the instance of Mr. BEVAN'S election. Two points seem to deserve especial remark. Mr. BEVAN is a very large local employer of labour, having a thousand hands engaged on his premises, of whom 180 were voters at the date of the election. His foreman, without his master's authority, and after having obtained from Mr. BEVAN'S election agent an assurance that the proceeding was legal, announced on the evening before the polling day that on the next day the men would have a holiday, but would be paid as usual. About 150*l.* was paid for the wages of the day, although no work was done. It appeared that on the occasions of the two previous elections, though Mr. BEVAN gave his hands a holiday, he did not give them anything to compensate for their loss of time; and the Judges were of opinion that the foreman, in instituting the innovation when his master was a candidate, intended to influence the election. But they added that they gathered this intention not only from this particular act, but from the rest of the conduct of the foreman during the time of the election. So that it cannot be said to have been distinctly laid down that the payment of the usual wages when a holiday is given on polling day is in itself a corrupt act. It also appeared that on two or three occasions previous even to the dissolution, Mr. BEVAN had subscribed to the funds of local Liberal Associations, and the money so given was spent in eating and drinking. The Judges held that, at any rate on the most recent of these occasions, Mr. BEVAN had put himself forward as a candidate for the seat whenever a vacancy should occur. He gave the money, and there was nothing wrong in subscribing to an Association in support of the party to which he belonged. Nor did he subscribe with a knowledge that the money would be improperly expended, for otherwise the Judges would have considered him personally guilty of a corrupt practice. But the Association, when it had got his money, expended it improperly; and the Judges held that the members of the Association must be taken to have been his agents for the purpose of distributing the money. It is always dangerous to infer general rules from the decisions of judges in any one inquiry. They are guided by the whole of the facts before them, and see each alleged fact as part of the total conduct of the respondent and his agents. So many other things were proved against Mr. BEVAN'S undoubted agents that suspicion seemed naturally to attach to the distribution of his money by the Association; but it would be going much too far to assume that, if a candi-

date or a sitting member subscribes to the funds of a party Association, he is to be held answerable for the mode in which the money that comes into its hands may happen to be employed.

This doubt is confirmed by the decision of the Judges in the case of the Harwich petition. Mr. Justice LUSH, in delivering judgment, pointed out that the borough had been represented by a Conservative for fifteen years, that he had sat in several Parliaments without opposition, and that the Conservatives had done no more than form an Association to watch over the interests of the party. It was alleged that some of the members of this Association had been guilty of corrupt practices; but, without deciding whether or not these corrupt practices had been established, the Judge pronounced that those who were supposed to have been guilty of them stood to the respondent in the relation, not of agents, but of partisans. It is clear therefore that where general purity has characterized the election a candidate is not necessarily held responsible for the illegal acts of an Association working in his favour. But the conduct of a much more illustrious Association than that of the Harwich Conservatives came under the review of Mr. Justice LUSH, and called forth from him an extremely unfavourable criticism. It appeared that the local Liberal agent had received from the Liberal Central Office in Parliament Street a circular addressed to him in common with other Liberal agents throughout the kingdom. It pointed out that, by the Act then just passed, the conveyance of voters within the limits of boroughs had been legalized, while it still remained illegal to pay for the conveyance of borough voters from a point beyond the borough limits. An endeavour was then made to remove what was stated to be a misapprehension as to the consequences of doing what the law had thus pronounced to be illegal. It seems to have been supposed that if the agent of a candidate paid for the conveyance of voters from beyond the borough limits the seat of the candidate would be endangered. The Central Committee pointed out that this was a mistake, and that the only consequence of making such a payment was that the party making it would be liable to a comparatively small fine. This Mr. Justice LUSH treated as an incitement to commit an illegal act, and therefore a misdemeanour. As the conveyance of voters within the limits of boroughs is legal, and as voters may be legally conveyed from any distance in county elections, there does not seem to be any clear principle on which the Legislature has rested in making the conveyance of borough voters beyond the borough limits illegal. But still it is illegal, and the Central Committee must have meant to intimate to the local agents that it was only a question of money, and of a small sum of money, and that the local agents had only to consider whether it was worth their while to risk the payment of a fine in order to get their outlying voters to the poll. They looked, in fact, on the fine as a kind of forfeit, the payment of which would entitle the agent to convey these voters. In the eyes of the law this is not a proper mode of regarding a fine. The fine is the punishment for a legal offence, and no one is allowed to incite another to commit a legal offence. It is obvious that this view of the matter never occurred to the minds of those who issued the circular; and they made a mistake on which a charge of misdemeanour might probably be grounded. Whether, under the circumstances, any one would be found to prosecute, or whether any serious consequences would follow, is a different matter. It may at least be assumed that the mistake will not be repeated.

Even where reasons have been found for invalidating the elections, there is little or nothing to connect the expenses of elections with corrupt practices. There is no apparent reason why in different constituencies it takes such very different sums of money to win or contest a seat. Mr. FAWCETT has been addressing his constituents on the subject, and has informed them that Hackney offers an illustrious example of a constituency with a very large population where only a very small amount need be expended by the successful candidates. He said that beyond their contributions to the expenses of the Returning Officer, he and his colleague had not had to spend more than 300*l.* This is exceedingly cheap, but it does not appear that Hackney can be said to offer a guiding example as to large constituencies. We may take it for granted that the Liberal representatives of Birmingham and Bradford did not spend a penny beyond what they thought it both necessary and proper to spend. Still, at Birmingham they spent a little over 6,000*l.*, and at Bradford a little under. In South-East Lancashire the two successful Liberals spent over 12,000*l.*, and in West Kent the two successful Conservatives spent over 10,000*l.* The contested Ridings of Yorkshire seem to have cost each party from 7,000*l.* to 8,000*l.* As a rule, the Conservatives appear to have spent more than their opponents. At Greenwich, for example, they spent over 7,000*l.*, while the Liberals spent as nearly as possible only half that sum; and exactly the same proportions are noticeable in the returns from Blackburn. It is difficult even to guess why, in boroughs that might seem of somewhat the same class, the scale of expenditure should have been so various. Thus at Southampton there was spent on the Conservative side over 4,000*l.*, and on the Liberal side there was spent over 3,000*l.* At Oxford, again, the expenses of the two Liberal candidates reached 3,000*l.*, and those of the Conservative candidate fell a little below. But at Salisbury four candidates spent an average of only 650*l.* apiece, and at Northampton the average expenditure of four candidates was only 350*l.* Nor does it appear that excess of expenditure generally went with success at the poll. Norwich may be taken as a conspicuous example of the dissociation of spending from winning, for there the two successful Liberals spent only 1,500*l.* between them, while the two unsuccessful Conservatives spent over 6,000*l.* The practical result appears to be that no candidate can tell what he may have to spend until he has acquainted himself with the peculiar character of the constituency he is anxious to represent; but perhaps, if we are to strike an average, we may say that where there is a contest a candidate for a borough may reckon on spending about 1,500*l.*, and a candidate for a county about 3,000*l.* There are, of course, lucky candidates who spend less, and unlucky candidates who spend more. But this rate of expenditure is very different from that of the model borough of Hackney, and the real question to consider in contemplating any legislation on the subject is whether the average expenditure would be increased or diminished, and not whether in exceptional places the expenditure might be found to be wonderfully small.

DISARMAMENT.

IT is always a question whether a motion such as that which Mr. RICHARD brought forward on Tuesday is best met by argument or by ridicule. In favour of the latter method there is the inherent and obvious absurdity of the proposal, with the certainty that its adoption would only lay us open to the laughter of foreign Powers. In favour of the former method there are the facts that ridicule has again and again been tried, and again and again failed of its purpose; and that men who have not been convinced by the irony of events will probably be equally proof against the less effectual irony of language. Under any circumstances, it was to be expected that Mr. GLADSTONE would choose to reason with Mr. RICHARD rather than to laugh at him, and the growing magnitude of the evil which Mr. RICHARD attacked undoubtedly tends to justify Mr. GLADSTONE'S preference. The armaments maintained by the Great Powers of the Continent are a standing injury to labour and a standing menace to peace. The invention of a nation in arms has proved more disastrous than any amount of what used to be called standing armies. It was formerly said—and said, if we are not mistaken, by some of Mr. RICHARD'S own supporters—that a nation in arms would be the best possible security against unnecessary wars. It is a security which every Continental country now possesses, and Germany and Russia are eminent examples of its value. The real safeguard against unnecessary wars lies in the means which a people possess of making their indisposition to engage in them felt by their rulers. In other words, it lies, not in the identity of the army with the nation—since, though this may be a security against civil war, it is none at all against foreign war—but in the control which the nation in its civil capacity is able to exercise over its rulers. Where Parliamentary institutions are wanting, as in Russia, or feeble, as in Germany, the nation in arms will have to fight and will be willing to fight its neighbours whenever the Government gives the signal.

The only consistent advocates of disarmament are those foreign gentlemen who occasionally preach universal war as the indispensable prelude and condition of universal peace.

At present, they say, the people are everywhere oppressed and misgoverned, and so long as this state of things lasts wars must be resorted to to get rid of it. When the brotherhood of nations has been proclaimed and the Social Republic set up all over Europe, armies will be no longer wanted. Mr. RICHARD, on the other hand, has to get over the difficulty that some results of which he approves have been attained by war. Even Mr. COURTNEY pointed out the inconsistency of rejoicing at changes like the unification of Italy, and in the same breath denouncing the sole means by which these changes could have been brought about. The Austrian Government, as he truly remarked, "did not "withdraw its forces from Lombardy and Venice from "any conviction of the injustice of its domination over "the Italian people." If France had disarmed at the suggestion of Mr. COBDEN in 1851, it is highly improbable that the war of 1859 would ever have taken place, and without the war of 1859 Italy might still have been a geographical expression. Mr. RICHARD will perhaps answer that the unity the Italians desired would have been brought about all the same by the operation of natural forces. But armaments are among the most effective modes of expression which natural forces find for themselves, and, deprived of armaments, natural forces would probably remain inoperative. Mr. RICHARD, again, may not shrink from the heroic declaration that, rather than see Italy united by force of arms, he would have been willing to see her union indefinitely postponed. There is no evidence, however, that any section of the Italian people are of Mr. RICHARD'S mind upon this point. On the contrary, they are constantly giving evidence of their desire to go further in the same road by the use of the same means. Before the nations of Europe can be convinced that armaments are an unmixed evil, they must be convinced either that the objects they have gained by the use of armaments were not worth gaining, or that they might have been gained in other ways. The latter theory is too plainly untrue to stand much chance of acceptance; the former may be perfectly true, but its truth is of a kind which only uninterested bystanders are likely to perceive. It may be an open question whether the reconstruction of Germany is, as Mr. GLADSTONE calls it, "a "great advance in the political system of Europe"; but it is as certain as anything can be that Germany would not have been reconstructed had it not been for the German army. If Mr. RICHARD'S visit to the several capitals of Europe in 1869 had been successful, and Germany and France had been included among the Powers who laid down their armaments, the results arrived at in the following year would never have occurred to either nation as possible. Prussia would have had no opportunity of displaying her military strength, and, without the conviction of her material superiority which this display wrought in the minds of her neighbours, the particularist tendencies of the other German States would never have been overcome.
